From March, 1899, to November, 1904, the members of the National Founders' Association and the iron molders' union met together frequently under the terms of the New York agreement to discuss their differences. This agreement was not a perfect instrument by any means, nor as comprehensive as either side might desire. And yet, when we review the history of that period we can not but marvel at the wonderful influence it exerted in promoting peace in the foundry industry. It is not that there was no conflict between members of the subscribing associations, for there was. But, considering the period of extraordinary expansion in the iron trade which it covered, they were remarkably few.

What happened in November, 1904? The New York agreement was abrogated, not by a conference representing the original subscribers to its provisions, but by one of them—the National Founders' Association.

Why was it abrogated? Because the iron molders' union was unwilling to incorporate provisions which its members were not convinced were a proper solution of some of the difficult problems which had arisen in the foundry.

But we have not space to discuss this abrogation in detail; suffice it to say that during 1905 and 1906 it left that branch of the foundry industry represented by the N. F. A. just as it was before March, 1899, without any means at its disposal to calmly discuss the differences of its essential interests. Nor was it in as good a position as it was in the earlier period, for peace was further jeopardized by the advice given to the members of the iron molders' union, which did not include in their provisions all of the clauses of the "outline of policy" of their association. Among these was a clause which enunciated what is now popularly known as the "open-shop" policy. Mark you, the N. F. A. insisted that all agreements should embody an "open-shop" clause. It does not appear, and it is not true, that the iron molders' union insisted that a "closed-shop" clause should be embodied or that no agreement would be entered into.

CHIEF CAUSES OF STRIFE.

The iron molders' union believes, and statistics amply justify the belief, that wages and hours of labor are by great odds the chief causes of industrial strife; and, consistently with this belief, has ever been willing to enter into agreements with foundry men covering and settling these points for a specific period, and covering such other points as can be mutually agreed upon by those directly

interested. Such agreements, I firmly believe, have eliminated and will still eliminate the greater percentage of strikes in our trade.

This belief is not shared by the present administration of the National Founders' Association. No better proof of this statement can be given than a review of the causes which have led up to the strikes now in progress. I do not know of a single instance among those in which the "closed shop" has been made an issue by the union. I will go further and say that in the great majority of instances where demands have been made and conferences have been granted by the foundry men, satisfactory settlements have been reached and agreements signed. The members of the iron molders' union have not signed agreements with an "open-shop" clause; nor have the members of the N. F. A. signed agreements with the "closed-shop" provision. Why should that question be raised when it is not an issue? And yet, even when the question of an increase of wages has arisen during the present year in a low-priced foundry community, of whose competition foundry men in higher-priced localities bitterly complain, the "open-shop" catch cry has been made to do service.

Before proceeding to a more specific reference to our present strikes, permit me to say that we are not so egotistical as to say that all the mistakes in these unfortunate controversies have been made by the members of the National Founders' Association. We are all prone to err, and sometimes when fears and passions have been needlessly aroused, or when opportunity has not been afforded for the play of the judicial mind, strife has been precipitated, which, under more favorable conditions, might have been avoided.

PHILADELPHIA STRIKE.

Perhaps none of our present strikes has been so well advertised as that now going on in Philadelphia. Let us trace its cause. In October, 1905, the core makers of that city sent the following communication to the foundry men:

"GENTLEMEN: Owing to the advance in the cost of the necessities of life, and the outlook for better trade in general, we respectfully petition you for an advance of 25 cents a day to all the journeymen core makers in your employ, making the rate to core makers \$2.75 a day and upward. We respectfully request an answer."

No definite reply having been received from this notice, a committee from the union waited upon each firm, and in each instance was informed that the foundry men would not discuss the matter with them. The next step was to have the core makers' committee in each shop interview their employer relative to the desired advance. Again the core makers were informed that the foundry men could not discuss the merits of the proposition with them, as the matter had been placed in the hands of their association and would have to be taken up with its officers.

After having received this information, efforts were made by both the local and national officers to secure a conference at which the sole question to be discussed would be that of wages. Personal interviews to this end were held with both the officers of the Philadelphia Foundrymen's Association and the National Founders' Association, and in both instances the officers of these organizations refused to grant a conference or discuss the merits of the question.

The result was inevitable, for can any fair-minded man say that the core makers of Philadelphia were making extravagant demands when they asked that their wages be advanced from \$2.50 to \$2.75 per day? I make the statement, and make it advisedly, that fair and courteous treatment of this reasonable demand would have prevented the serious and unprofitable conflict that has followed.

STRIKES AND CAUSES.

Let me enumerate a few of the strikes involving the members of the N. F. A., and their causes:

- Chicago, an increase in the wage rate.
- Boston, an increase in the wage rate.
- St. Paul and Minneapolis, an increase in the wage rate.
- Buffalo, an increase in the wage rate.
- Anthracite district of Pennsylvania, nine-hour day.
- Milwaukee, nine-hour day and increase in the wage rate.
- Missouri Valley, a minimum rate and a nine-hour day.
- Toledo, an increase in the wage rate and a nine-hour day.

That is a list of the chief centers where strikes of greater or lesser magnitude exist. Let me supplement it with a list of some of the localities where similar demands having been made, a conference between the foundry men and the molders' representatives effected a peaceful settlement:

Cincinnati, granted the nine-hour day.

Cleveland, granted the nine-hour day.

Indianapolis, granted an increase in wages.

Central New York, granted in some instances an advance, in others a nine-hour day, or both.

New York district (comprising New York City, Brooklyn, Jersey City, Newark, and Plainfield), granted an increase in wages.

This list includes the most important centers to note that it was not in insignificant centers, nor where inconsiderable numbers of men were involved, that conferences established peace. It is true conferences were not so successful in Buffalo, but the issues were confused there. Issues were injected which should not have been, and which, I firmly believe, were thrust to the front for the representative of National Founders' Association for the purpose of precipitating a conflict.

In enumerating the causes of strikes I have recited what the molders regard as the salient feature of their demands.

Each locality had questions of its own to consider and to embody in its agreement. In some instances they touched upon vital issues, such, for example, as piecework, apprentices, and so on. These same questions had been up in previous years, and by the exercise of a little common sense by both parties were successfully overcome. The same could have been accomplished in 1906 had it not been that the policy of the iron molders' union of treating local disorders or conditions with local specifics was repudiated by the members of the N. F. A., and an effort was made to force upon us the provisions contained in the "Outline of policy," "open shop" included.

THE PRESENT CONFLICT.

To sum up, I believe that the present conflict is due primarily to the abrogation of the New York agreement, and the subsequent policy of the administration of the N. F. A. to force down the throats of the members of the iron molders' union their "Outline of policy." They are guilty of deliberate misrepresentation and falsehood who proclaim that the issue of the present struggle is the "open shop." That issue is one of the administration of the N. F. A. It is a cry to conjure with in the present era. It has been made to do service in the most unholy of causes and has come to be looked upon by the members of the iron molders' union as a "shibboleth" designed to hide the real purpose—the destruction of their organization. Wages and hours of labor have constituted the chief features of all the molders' demands this year. They have asked for agreements covering these points for a stated period, believing that thereby the material interests of foundry men and molder can be best subserved. And, finally, the persistency with which the officers of the N. F. A. have forced the "open-shop" question to the front, and the campaign of antagonism, abuse, misrepresentation, and slander they have inaugurated have convinced the officers and members of the iron molders' union that their true and ulterior purpose is the disrupting of their organization.

We stand ready to-day, as ever, to meet organized individual foundrymen in fair and friendly conference; we are ready to lend our assistance in the promotion and maintenance of peace in the foundry industry; but we would be regarded as poor types of men, indeed, were we to submit without a struggle to the issue now forced upon us.

JOS. F. VALENTINE,
President I. M. U. of N. A.

Mr. FREY. Answering your question, Mr. Thompson, I believe collective bargaining is greatly to the workman's advantage and that he is helpless without it.

Mr. THOMPSON. If the commission please, that is all I wish to ask.

Commissioner HARRIMAN (presiding). Mr. Lennon, have you any questions?

Commissioner LENNON. No.

Commissioner HARRIMAN. Mr. Delano, have you any questions?

Commissioner DELANO. Mr. Frey, we asked Mr. Briggs to put in evidence a copy of the constitution and by-laws of the foundrymen's association. I think it would be of interest to the commission to have a copy of the iron molders' constitution and by-laws, if we may.

Mr. FREY. We will give you a copy; we will send it to you later.

Mr. DELANO. Mr. Frey, you have objected—and not unnaturally, I think—to the employment of spies by the foundrymen's association. Do you keep your union free from criticism in doing similar things? What I have in mind is that I do not exactly see how you came to be in possession of these private documents?

Mr. FREY. These private documents, Mr. Delano, were given to us by members of the National Founders' Association who were not in harmony with the policy of their organization and desired that we should know just what was going on and who were friendly with us, but forced to retain their membership for business reasons, for commercial reasons.

Commissioner DELANO. Then they were traitors, and you dealt with them. They were traitors to their organization just the same.

Mr. FREY. Some people might consider it that way.

Commissioner DELANO. You would consider one of your men who went back on your organization a traitor, would you not?

Mr. FREY. One moment. I am afraid a wrong impression is going to gather here. The National Founders' Association reproduced many of these documents from which I have quoted in the Review, and to convert our members—

Commissioner DELANO (interposing). Is that generally published or privately published?

Mr. FREY. It is not only generally published, but an effort was made to see that every member of the molders' union got a copy. They thought they would convert our members to their idea, and I have been reading largely from the Review. Whenever I read from our journal it is copied from the Review. They furnished this information to us. They thought it would convert our members, and did it as missionary work, as propaganda.

Commissioner WEINSTOCK. When you say "your members" you mean members of the molders' union?

Mr. FREY. Yes.

Commissioner WEINSTOCK. Not members of the Stove Founders' Association?

Mr. FREY. No; the members of our union. They had a mailing list. I am editor of the Molders' Journal, and their mailing list was almost as extensive as mine. They still send them to some of the molders. Any molder can get it on request.

Commissioner DELANO. As I understand you, and also Mr. Valentine, one reason for the difficulty was that the foundry men's association had certain fixed conditions, from which they would not yield and which they would not arbitrate. Is that true?

Mr. FREY. Yes.

Commissioner DELANO. Is that true of your organization, that you had certain fixed conditions which you would not arbitrate?

Mr. FREY. I do not know. I have never known of an instance where we declined to take up any question. We do not arbitrate. In the conferences we have taken up every question that has ever been advanced by the foundrymen, and I presume we would, regardless of what it was, and discuss it on its merits. In fact, our position is that every question must be discussed on its merits and settled on its merits, if it is going to be settled permanently, and we believe it is because of that policy of taking up every question and settling it on its merits that our relations with the Stove Defenders' Association are friendly, and, what is important, have maintained peace for 22 years.

Commissioner DELANO. Is it not a fixed policy of your organization not to authorize the spread of piecework in nonpiecework shops?

Mr. FREY. Yes.

Commissioner DELANO. You would not arbitrate a question like that when that was a matter of policy, would you?

Mr. FREY. We have taken up this question time and again with members of the National Founders' Association, and to-day have agreements with their members not only providing for piecework but piecework on molding machines. It depends on the condition in the foundry, the kind of work being made, whether we feel like agreeing to piecework or feel that it is unfair.

Commissioner DELANO. Suppose a manufacturer insisted on the principle that he should be allowed to retain in his service men who declined to join the union, you would not permit him to do that, would you? Would not that be contrary to your principles?

Mr. FREY. It might be contrary to our principles, but I know of many instances where that condition has prevailed—and prevails, I know, in some in-

stances now. Our position on that would be different if the firm tried to introduce nonunion molders and we thought it was with the object of destroying our organization.

Commissioner DELANO. I think that is all, Madam Chairman.

Commissioner HARRIMAN. Mr. O'Connell, do you desire to ask anything?

Commissioner O'CONNELL. I have no questions.

Commissioner HARRIMAN. Mr. Ballard, do you desire to ask anything?

Commissioner BALLARD. I gather there are between 5,000 and 6,000 founders in the United States.

Mr. FREY. I think the last report showed about in the neighborhood of 10,000 founders in the United States and Canada.

Commissioner BALLARD. Can you tell me how many men work in those foundries?

Mr. FREY. No; there has never been a census. We have tried hard to get that, but it is impossible to secure that information.

Commissioner BALLARD. What proportion of those 10,000 founders are known as union founders and what as nonunion?

Mr. FREY. I could not give you that information. If I could give you that, it would not indicate much, because one dozen founders might not have as many men as another single founder.

Commissioner BALLARD. Is there a large percentage of the union men in the founders' association?

Mr. FREY. Yes.

Commissioner BALLARD. And the founders themselves are largely union men?

Mr. FREY. Yes.

Commissioner BALLARD. Is the minimum wage in all the foundries practically the same?

Mr. FREY. In a city or district it is. For instance, the minimum wage rate in Chicago is the same for all the foundries in Chicago. It so happens we have been able to establish what we originally tried to do in the Connecticut Valley district, up and down the river there. The minimum wage rate is the same in the different cities there.

Commissioner BALLARD. The agreement of 1899, known as the New York agreement, was, you told me, abrogated in about 1904?

Mr. FREY. The foundry men notified us in November of that year they had abrogated it.

Commissioner BALLARD. And then they wanted you to adopt a form of agreement drawn up by them, and you would not consent to that?

Mr. FREY. They wanted us to adopt the form in the spring of that year.

Commissioner BALLARD. That is an agreement that was written in 1899, that has been in force for three or four years?

Mr. FREY. Yes.

Commissioner BALLARD. Who got up that form of agreement?

Mr. FREY. That agreement was entered into between representatives of both associations.

Commissioner BALLARD. But who drew it up? Was it a joint agreement?

Mr. FREY. It was a joint agreement.

Commissioner BALLARD. Was it jointly drawn up?

Mr. FREY. It was jointly entered into. It was drafted as the result of conferences of men who were national officers of their respective associations.

Commissioner BALLARD. If the conditions in union foundries seem to be so much better than before, or in nonunion foundries, why do these foundries seem to be so unwilling to have their shops unionized? What reason do they give to you for so bitterly opposing it?

Mr. FREY. I presume it is dislike of the idea of having to deal with a trade-union, and the impression that if they do so they will not be able to operate their plants just as they have a mind to. In other words, it is the desire to enjoy the benefits of their association, an organization for themselves, and not allow their workmen to have the same opportunity and the same advantage.

Commissioner BALLARD. I think most of these organizations of the manufacturers came after the workmen organized. I never heard of an employers' association or manufacturers' association until after the workmen organized.

Mr. FREY. There were foundrymen's organizations before the national molders' union organized.

Commissioner BALLARD. Not for the purpose of fixing hours of labor or wages?

Mr. FREY. For the purpose of dealing with labor questions.

Commissioner BALLARD. I did not know that.

Mr. FREY. Yes. In fact, there was a strike when our national union was organized in 1859, forced by an organization of employers who were trying to put our union out of existence at that early date.

Commissioner BALLARD. That is all, Madam Chairman.

Commissioner HARRIMAN. Mr. Weinstock, have you any questions?

Commissioner WEINSTOCK. What are the hours of labor now among the molders' unions east of the Rocky Mountains?

Mr. FREY. East of the Rockies, with but very few exceptions, nine hours.

Commissioner WEINSTOCK. Do you know of any other district outside of San Francisco that has an eight-hour day?

Mr. FREY. Yes; our members enjoy the eight-hour day in some of the plants in Baltimore, and they enjoy the eight-hour day in some of the plants in Plainfield, N. J. Mr. Valentine could help me out on that. There may be some others than Baltimore and Plainfield.

Mr. VALENTINE. There are others.

Mr. FREY. Yes; I think there are some others.

Commissioner WEINSTOCK. That is Plainfield, N. J.?

Mr. FREY. Yes.

Commissioner WEINSTOCK. Those are the only two places you can think of now?

Mr. FREY. Yes. We probably have small foundries where they have it, but I mean where it is really a factory deserving of mention.

Commissioner WEINSTOCK. Otherwise it is a nine-hour maximum?

Mr. FREY. Nine hours maximum.

Commissioner WEINSTOCK. I gather from what you say that you believe the molders' unions are greater respecters of all contracts than are the employers?

Mr. FREY. No; we are no greater respecters of contracts than the members of the Stove Founders' National Defense Association.

Commissioner WEINSTOCK. I refer to the other employers.

Mr. FREY. Oh, yes; we believe we consider our contracts much more sacred than they do.

Commissioner WEINSTOCK. Your point is, you have always respected your contracts, but the employers in your founders' association did not respect their contracts?

Mr. FREY. I would not want to say that generally. We think the majority of their members did—and some did not. In some cases they endeavored to discipline their members who did not. In other cases, where members are pretty well entrenched and were drilling something as they have done in Ulster, they did not try to apply discipline.

Commissioner WEINSTOCK. Were there any instances that you know of where the molders' unions violated their contracts?

Mr. FREY. There were cases where our members went out on strike while a contract was in force, but in every one of those instances we forced our members back to work. In fact, the first strike I ever became involved in as a molder occurred when this agreement had just been entered into. I did not know that it existed; and in that town we forced our members back to work in this one shop while in the other foundries they all remained out on strike.

Commissioner WEINSTOCK. Did not the workers in the other foundries also belong to the molders' union?

Mr. FREY. Yes; but the foundry men did not.

Commissioner WEINSTOCK. The foundry men did not?

Mr. FREY. All the foundry men were not members of the association.

Commissioner WEINSTOCK. They did remain out on strike where there was no agreement?

Mr. FREY. Yes.

Commissioner WEINSTOCK. And where an agreement prevailed you were obliged to go back?

Mr. FREY. When we found they were members of the association we forced our members back to work.

Commissioner WEINSTOCK. You said the molders' unions do not believe in arbitration in the sense that we now use the word "arbitration," being an umpire?

Mr. FREY. I want to qualify that and say we do not believe arbitration is as effective as the practice of conciliation and conference.

Commissioner WEINSTOCK. Have you ever been willing, and would you be willing to-day, to submit to arbitration, to an umpire, any disputed matter?

Mr. FREY. We would not be willing to submit any question to arbitration until we had satisfied ourselves it was impossible to reach any agreement through the methods with which we have become familiar.

Commissioner WEINSTOCK. Assuming all other methods had failed and it was a choice between arbitration with an umpire or strike, what would you do?

Mr. FREY. I would have to wait until I reached that bridge. I do not know. It would depend on circumstances.

Commissioner WEINSTOCK. Have not such instances arisen in the past?

Mr. FREY. No; not in the history of our organization.

Commissioner WEINSTOCK. There have been strikes?

Mr. FREY. Yes.

Commissioner WEINSTOCK. Was there an attempt made to arbitrate before the strike was declared?

Mr. FREY. No. We have always tried to adjust these matters first through the parties directly at interest—molders or foundry men—and if they failed, then through representatives of the molders and representatives of the foundry men.

Commissioner WEINSTOCK. In other words, you have gone the gamut of conciliation?

Mr. FREY. The gamut of conciliation and negotiation.

Commissioner WEINSTOCK. But when conciliation has failed, then you have struck?

Mr. FREY. Yes.

Commissioner WEINSTOCK. Without arbitrating?

Mr. FREY. Yes.

Commissioner WEINSTOCK. So you have practically refused to arbitrate?

Mr. FREY. Yes; we do not believe that arbitration would settle; but if we, as practical men familiar with all the details of the problems involved, can not reach a satisfactory basis, certainly no outsiders could do it for us. It might involve an arbitrary ruling, and that would settle nothing.

Commissioner WEINSTOCK. Then we have this proposition and conclusion, that you do believe in conciliation but you do not believe in arbitration?

Mr. FREY. I think that that statement is fairly accurate.

Commissioner WEINSTOCK. Granting that conciliation is preferable to arbitration, is not arbitration preferable to a strike?

Mr. FREY. Under certain circumstances I should say no. There are many times when a strike is better than arbitration, because the atmosphere needs cleaning and clearing up, and a strike will do it when nothing else will. For instance, taking the situation which I have just taken as an illustration of the ground to be covered, would an arbitration, directing members of the foundrymen's association to enter into agreements with us after the expressions of opinion I have just read result in bringing about a condition where we would work together? It would be impossible.

Commissioner WEINSTOCK. Then your statement, Mr. Frey, carries out the statement made by Mr. Briggs when he was on the witness stand, that they had endeavored during all the several years that they operated under the agreement to get arbitration and had utterly failed.

Mr. FREY. I can not recall a single instance where Mr. Briggs or any officer of the National Founders' Association offered to submit to arbitration, and I was very much surprised to hear him make the statement that he did. When the time came for them to build up their machinery they might then say, "Why do you not arbitrate these things?" But they never made a straight-out proposition for arbitration. In fact, while we had friendly relations with the association, Mr. Briggs was neither its president nor its agent. He came in at the time that the breach occurred.

Commissioner WEINSTOCK. You consider that the weak spot in arbitration, as you see it; that is, arbitration with an umpire, when the pressure comes from without rather than from within?

Mr. FREY. Yes.

Commissioner WEINSTOCK. And that, therefore, one side or the other would risk the decision of the arbitrator because it would apparently be against their interest?

Mr. FREY. Yes.

Commissioner WEINSTOCK. And that therefore they would not submit?

Mr. FREY. They would not adopt—

Commissioner WEINSTOCK. The decision of the arbitrator?

Mr. FREY. They would evade it as far as possible.

Commissioner WEINSTOCK. Could not that be overcome by adopting the practice that is followed in a great many industries here and abroad by both sides agreeing in advance that the decision shall be enforced, shall be binding and final?

Mr. FREY. The trouble with that—and I am speaking now from experience—is that where two parties agree that if they fail to reach an agreement upon a question it shall go to arbitration, one or both of those parties fails to make a sincere, earnest effort to settle and tries to get more through the award of an arbitrator than they would get otherwise, the haggling of the market.

Commissioner WEINSTOCK. From that point of view, then, the Newlands Act is not a wise act?

Mr. FREY. In my opinion it is not a wise act.

Commissioner WEINSTOCK. And you would not advise broadening that act or strengthening it?

Mr. FREY. I would not advise unloading any one's responsibility upon a third man.

Commissioner WEINSTOCK. Then, from your point of view, the protocol of the cloak makers in New York is an unwise agreement?

Mr. FREY. No.

Commissioner WEINSTOCK. Because that stipulates that in the last analysis there shall be arbitration, and that arbitration shall be binding on both sides.

Mr. FREY. I believe that provision of the New York protocol is advisable because the two groups would never become familiar with each other, or familiar with the methods of organization of each other. As a temporary measure it is an advisable thing.

Commissioner WEINSTOCK. If that is true, it must be, then, that the protocol will not be maintained?

Mr. FREY. I think it will be modified.

Commissioner WEINSTOCK. You think that the arbitration part of it will be cut out?

Mr. FREY. There will be less arbitration and more negotiation.

Commissioner WEINSTOCK. Then you do not think, for example, that it would be wise on the part of this commission, if, as the result of its investigations, it should decide to recommend a system of conciliation, with arbitration as the ultimate?

Mr. FREY. I think it would be a mistake.

Commissioner WEINSTOCK. You think it would be a mistake?

Mr. FREY. Yes.

Commissioner WEINSTOCK. What would you advise this commissioner to recommend, from your experience?

Mr. FREY. I would recommend that wherever workmen are organized, that employers, recognizing their natural right to organize, should take up with their representative body whatever questions may arise, and endeavor to settle them; if not immediately, continuing until finally adjustments are reached.

Commissioner WEINSTOCK. Then what would you recommend in the event of these evenly balanced bodies being utterly unable to agree? Would you advise a strike or a lockout?

Mr. FREY. I believe that if two large organizations, one of employers and one of workmen, reached a point where they could not agree, and that point was a vital one, no arbitration could settle it. It might temporarily prevent an outbreak, but the outbreak would come, and nothing could stop it. You might stop it temporarily through an award, but if the parties were very wide apart, the conflict will come some day or other.

Commissioner WEINSTOCK. That may be true, but because there may be a conflict, is that any good reason for hastening it? Is it not good policy to postpone it as long as possible?

Mr. FREY. Yes; I believe so.

Commissioner WEINSTOCK. If your theory had been adopted in San Francisco, we would have had war three years ago.

Mr. FREY. There was the very thing that I am recommending. You had no arbitration; you had negotiation and conciliation there.

Commissioner WEINSTOCK. It was not outside of the organization. Both organizations had conciliatory bodies?

Mr. FREY. Yes.

Commissioner WEINSTOCK. And they came together?

Mr. FREY. Yes.

Commissioner WEINSTOCK. And they discussed the matter pro and con for months?

Mr. FREY. Yes.

Commissioner WEINSTOCK. And they were practically unable to come to any agreement?

Mr. FREY. Yes.

Commissioner WEINSTOCK. And war was in sight, but it was finally suggested that they submit their differences to an outside body, which had absolutely no interest in their industry, either as employers or workers, and it was this outside body that finally made recommendations that were adopted by both parties?

Mr. FREY. But it was the method of negotiation and conciliation that was followed, rather than that of arbitration.

Commissioner WEINSTOCK. Yes.

Mr. FREY. It was not the third man deciding what should be done by voting one way or the other?

Commissioner WEINSTOCK. That is true.

Mr. FREY. And that is what I am referring to as arbitration now.

Commissioner WEINSTOCK. Yet the metal trades of San Francisco did have an agreement. Of course, they are not operating under an agreement to-day, but they did have an agreement that they must provide some means of settlement, if necessary, by arbitration, before a strike or lockout could take place, so that they differ, evidently, from your point of view.

Mr. FREY. They may, somewhat; yes.

Commissioner WEINSTOCK. Can you tell us what is the membership of the Founders' National Defense Association?

Mr. FREY. I have seen their directory. They have 70 or 80 members, I think. I will ask Mr. Hogan what it is. It is 70 or 80, is it not?

Commissioner O'Connell. It is 78.

Commissioner WEINSTOCK. What is the membership of the other association?

Mr. FREY. They claim to have 560 members. Mr. Briggs made that statement. I do not know how many they have.

Commissioner WEINSTOCK. You were speaking about these contracts that had been entered into on the part of Mr. Briggs's association with individual workers. You read one of them here.

Mr. FREY. Yes.

Commissioner WEINSTOCK. Were those contracts entered into only with non-union men?

Mr. FREY. Those contracts were entered into only with men who hired out to act as professional strike breakers.

Commissioner WEINSTOCK. Therefore, they, in all likelihood, would be non-union men?

Mr. FREY. Some of them were our members, who took up the occupation of strike breakers because they thought they could make more.

Commissioner WEINSTOCK. But they could not remain members of the union?

Mr. FREY. Oh, no.

Commissioner WEINSTOCK. Their relations were automatically severed with the union?

Mr. FREY. We released them from the union.

Commissioner HARRIMAN. I should like to know what specific steps, if any, the molders' union has taken, since 1907, to bring about a better understanding with the National Founders' Association.

Mr. FREY. Absolutely none. We prefer to deal with their members as we used to before that organization was created, and we are dealing with them quite successfully. We are dealing with them, but possibly not with a very large number of them.

Commissioner HARRIMAN. You have not tried in any way to bring about a better feeling, so that it would be possible for you to work together, from your side?

Mr. FREY. We have done everything we could to bring about a better feeling with the members individually.

Commissioner HARRIMAN. But not with the organization?

Mr. FREY. Oh, no; we have no desire to, unless they change their policy. Their policy is one of annihilation, and we do not want to make friends with people who are trying to destroy us.

Commissioner COMMONS. Are there founders, individual shops, that you prohibit your members from working in?

Mr. FREY. Are there such foundries?

Commissioner COMMONS. Yes.

Mr. FREY. Oh, yes.

Commissioner COMMONS. There are certain foundries that a man in good standing is not allowed to work in?

Mr. FREY. A man in good standing is not allowed to go to work in a shop that we call a closed shop—that is, closed to union men.

Commissioner WEINSTOCK. That would be equivalent to an unfair shop?

Mr. FREY. Yes. It is called a closed shop.

Commissioner COMMONS. Would that be published in a list?

Mr. FREY. We notify our members. We say, "The White shop is closed to union men," or, "The Brown shop is closed to union men." We advise our members which shops are closed to union members.

Commissioner COMMONS. Could you give us any idea as to the number of those shops?

Mr. FREY. I would not want to, offhand.

Commissioner COMMONS. Where can that information be obtained?

Mr. FREY. I will furnish you with copies of our Journal, and you will find it there.

Commissioner COMMONS. The object is simply to advise your members?

Mr. FREY. To advise our members.

Commissioner COMMONS. As to the shops?

Mr. FREY. That they should stay away from.

Commissioner COMMONS. As to the shops that they should stay away from?

Mr. FREY. Yes.

Commissioner COMMONS. On this question that Mr. Weinstock asked, with reference to the establishment of a permanent national body, you answered it under the impression that he meant that that body should be given power to arbitrate, I think. Now, supposing that body was given power only of mediation or using conciliation in a different sense, a conciliatory or mediating power, or endeavoring to get—

Mr. FREY. I would be heartily in favor of anything that would increase the application of mediation and conciliation, because in my opinion it is not the conciliation of the labor trouble, but it is the only thing that maintains the largest degree of peaceable relations.

Commissioner COMMONS. Does your organization have any contact with the State boards of arbitration and mediation and conciliation?

Mr. FREY. We have had the members of such boards talk to us, but wherever they have offered their good services and tried to do something we have never seen any practical results, or many practical results. We have not found them effective in our trade.

Commissioner COMMONS. Can you give any particular reasons why they have not been effective?

Mr. FREY. The foundry men generally decline to have anything to do with them.

Commissioner COMMONS. You think the foundry men would not listen to them?

Mr. FREY. We would gladly have taken advantage of anything they could do to assist to bring about a settlement of the question.

Commissioner COMMONS. That is, if they could have arranged a conference with the foundry men you would have accepted it?

Mr. FREY. Why, yes; because we find that when we can meet the foundry men and talk matters over we generally reach a settlement, and as I read from that circular the members of the National Founders' Association were advised not to meet with us in conference because of the danger of reaching a settlement of their strike. They were afraid to talk with us because it would lead to a settlement of the strike.

Commissioner COMMONS. In arranging such a conference, should there exist such an opportunity, naturally that board would be represented at the conference?

Mr. FREY. Yes.

Commissioner COMMONS. But only in a mediating capacity?

Mr. FREY. Only in a mediating capacity.

Commissioner COMMONS. Attempting to bring them together?

Mr. FREY. Not as a party with arbitrary right to cast a third vote and determine what should be done.

Commissioner COMMONS. Is there any other point you wish to speak of?

Mr. FREY. No.

Commissioner WEINSTOCK. It has been suggested that in order that there may be no room for misunderstanding as to the meaning of words that you be good enough to define what you mean by "conciliation" and what you mean by "arbitration." How do you differentiate between the two?

Mr. FREY. By "conciliation" I mean friendly negotiation between the parties who are directly at interest or conferences between those not directly interested, but representing the same sides. By "arbitration" I mean a condition where a question is submitted to outside parties not directly affected and where, through the odd vote, the question is determined one way or the other.

Commissioner WEINSTOCK. Can there not be arbitration without there being an odd vote?

Mr. FREY. Then it is not arbitration; it is negotiation and conciliation.

Commissioner WEINSTOCK. For example, supposing there were three men there representing the labor, and three men representing the employers, and four out of the six should reach the same conclusion, would not that be arbitration?

Mr. FREY. I can conceive of no such thing as arbitration where the representatives of each side are equal in number.

Commissioner WEINSTOCK. Yet that has been done?

Mr. FREY. It may be called arbitration, but that is not what I have in mind when I have voiced my position on arbitration. My position on arbitration has been voiced with regard to having a third man.

Commissioner WEINSTOCK. An odd man?

Mr. FREY. An odd man to determine an industrial dispute, particularly between workmen and employers, who know more or less about getting along as organizations.

Commissioner WEINSTOCK. Just one more question. Can you, for the information of the commission, give an approximate estimate of the collective pay rolls of the two employers' associations that we have been discussing?

Mr. FREY. No.

Commissioner WEINSTOCK. Or approximately the number of men, workers, represented by the different employers' associations?

Mr. FREY. No; because I have made no effort to find out who the members of the National Founders' Association were for a number of years; it has been an immaterial factor to us.

Commissioner WEINSTOCK. Can you give the number of men employed by the Stove Founders' Association?

Mr. FREY. Mr. Hogan can give that better, I think. I think it is in the neighborhood of nine or ten or eleven thousand, depending upon conditions of trade.

Commissioner WEINSTOCK. Approximately 10,000?

Mr. FREY. Of course when trade is busy, approximately, you can say, 15,000.

Commissioner WEINSTOCK. That would be the maximum?

Mr. FREY. That would be the maximum in the industry as a whole.

Commissioner WEINSTOCK. I would like to ask Mr. Briggs if he could give us some idea of the men employed by his association.

Mr. BRIGGS. Around 30,000.

Commissioner WEINSTOCK. At this time?

Mr. BRIGGS. Yes.

Commissioner WEINSTOCK. That is the maximum molders?

Mr. BRIGGS. I should say that is the maximum in fairly good times.

Commissioner COMMONS. Mr. Briggs, you requested an opportunity to respond to some statements made. Will you take the stand?

Mr. BRIGGS. Certainly.

Commissioner COMMONS. And would you be willing that Mr. Frey should question you?

Mr. BRIGGS. Quite willing.

TESTIMONY OF MR. O. P. BRIGGS—Recalled.

Mr. BRIGGS. I thank you most heartily for this opportunity to respond. As a matter of fact, this reminds me to some extent of the conferences we used to have by virtue of the New York agreement, which we have been discussing here.

I have jotted down a few subjects as I have listened to the gentleman who has just preceded me, and I will take them up in order, as I have so made memorandums of them.

Mr. Valentine referred to certain statements which I made yesterday in which he thought perhaps I was mistaken, and possibly I was. I wish to reverse this position, and I would like very much, indeed, to correct one or two statements which Mr. Valentine made, which I do not think he intended.

First, we will take up the outline of policy which was submitted to you gentlemen yesterday. Mr. Valentine in one of his statements, if I remember correctly, gave as his reason, or one of his reasons, for the failure of the agreement between the two associations to work out satisfactorily the fact that the founders' association had attempted to jam down the necks of the molders our outline of policy. Also, if I remember correctly, he referred to the numerous conferences which we had held by virtue of this New York agreement, and those statements referred to this conference.

Now, my point: The outline of policy which the founders' association adopted was not drawn up or originated until May, 1904. The conciliation agreement, or New York agreement, which we have referred to, was abrogated in November, 1904, but was established in January, 1899; so that, as a matter of fact, it would have been impossible to have that outline of policy before the conference and conciliation meetings during the time those conferences were held. This is just for the purpose of correcting that date.

Mr. FREY. What will be the practice, Mr. Chairman? May I ask Mr. Briggs a question, or shall I wait until Mr. Briggs has finished his statement?

Commissioner COMMONS. As Mr. Briggs wishes; whatever he says.

Mr. BRIGGS. Whatever you desire.

Commissioner COMMONS. Then, you may ask the questions.

Mr. FREY. In view of your statement that the outline of policy was not adopted until May, 1904, how do you account for the recommendations which were made to your members at the beginning of the year not to enter into any further agreements with members of our union unless they contained what your association had demanded?

Mr. BRIGGS. That is why I asked you to give the date. I think we are a little mixed on the date.

Mr. FREY. No; I am not mixed on the date.

Mr. BRIGGS. Please establish the date.

Mr. FREY. I turned it over to the reporter—if the reporter can get it.

Commissioner COMMONS. Yes; I think it was taken out by the reporter.

Mr. BRIGGS. I thought he stated that this document referred to occurred in 1905.

Mr. FREY. No; 1904; and you congratulated your members on having carried out your instructions not to enter into any further agreement with us.

Mr. BRIGGS. I think it is best to have that clear, and I would like to have the document referred to.

(Here the reporter left the room, and returned with the documents requested.)

Mr. FREY. In connection with that matter, I find by the documents in my hand that my statement was right. This is the copy of the Review, dated June, 1914, and relates to a period from the beginning of that year, where the members were instructed not to enter into any more agreements, and congratulates them on having carried out that policy.

Commissioner WEINSTOCK. May I ask what date was the treaty or agreement abrogated?

Mr. FREY. In November of that same year.

Commissioner WEINSTOCK. Several months after the publication of this article?

Mr. FREY. Yes.

Mr. BRIGGS. Mr. Chairman, please bear in mind that at this time I was not attempting to reply to Mr. Frey. I was replying to Mr. Valentine, and in view of the fact that we have sort of mixed these two subjects up, I want to suggest that, if you will, you allow me to go through with my little list of answers that I have here, and reply to them, and perhaps many of these things which the gentlemen have in mind will be brought out, and if they present these questions we will make better time.

Commissioner COMMONS. All right.

Mr. BRIGGS. My reply was directed to the statement made by Mr. Valentine this morning, when he suggested that this outline of policy was used to ram down the throats of the conference at the time we were considering these questions, while the New York agreement was in force.

The next subject is in regard to molding machines. Mr. Valentine made the statement that the labor of the molder in operating these molding machines was exceedingly arduous. I wish to make this statement, that quite the contrary is true, and I will take, for example, one of the last machines that has been brought out, known technically as the jolt machine, and I think I am correct in making the statement that perhaps no more arduous labor occurs in the life of a molder than that of ramming the sand for an extremely large casting. There are times when these foundry men make castings that go far beyond the 20 tons—which, by the way, is a mistake, I think I said 100 tons—because we have several foundries that make castings that run up to that.

The amount of labor required in ramming the sand for one of these castings is very hard work; it is enormous. Within the last few years there has been brought out a machine known as the jolt machine, which performs that arduous labor and removes the necessity of it, or displaces it, by means of compressed air.

The molders often consumed from 10 to 20 days, sometimes I think considerably more than that, in ramming the sand for one of these large castings. The machine treats it in this way: The pattern is put in the flask, and the flask is placed on a table, as if this is the table [indicating]. Underneath is an air cylinder, where, by a simple turn of a valve, air is admitted and the sand is shaken down, and all this arduous labor is performed in 5 or 10 minutes, and the casting is more perfect than a piece by a skilled mechanic, more perfect than a skilled mechanic can possibly produce, because of the fact that the sand in this jolt machine is jolted down, and uses the best skill that a molder can use. He can not ram that sand in as uniformly as the jolt machine. I think you would find, upon investigation, that that same result follows the introduction of molding machines and improved appliances all along the line; perhaps not in so great a degree, but in some degree.

Again, the molders, like all other crafts, have for a number of years been anxious to secure shorter hours. Perfectly commendable. One of the greatest means within their reach to produce shorter hours is by the use of these machines, which eliminate the time, and which render it possible for the output of the foundry to be produced in less time. Our position is that a molder should assist with these machines, that he should have taken right hold of them and put them into the plants and made the most out of them, and assisted the foundry men in being able to produce their products, and by reason of which they could have performed this work in less time.

The statement was made here in regard to the molding machine, also, that they had no objection to it; that they allowed it to be introduced. I want briefly to touch upon the manner in which they allowed it to be introduced, and I take up the pulley illustration which I took up yesterday, commencing practically where I left off. That particular case will illustrate the attitude of the iron molders' union wherever I have met it, and I have met it in a great many cases.

Before our shop was unionized I had two sets of pulley machines, which cost me in the neighborhood of \$5,000 with the equipment. I had no difficulty with the molders themselves producing pulleys on these machines prior to the shop being unionized. Subsequently the union came into our town, and they wanted to unionize these shops, and I feel that Mr. Valentine will agree with me that he found no opposition in my shop. At the time Mr. Kehough introduced me to Mr. Martin Fox in Cleveland, the first time that I had the pleasure of meeting him, he did me the great favor of saying that when he came to Minneapolis Mr. Briggs was a man that gave him no opposition to meet whatever, but gave him the glad hand. I appreciate it.

After the shop was so unionized, there was a time when I was not making many pulleys and the machines were set aside. Subsequently I had an order for about a thousand pulleys. I put the order into the foundry, and the first time it came back I noticed it was quite excessive—three pulleys. The next day, three pulleys. So I called in the foreman and I said, "What about that?" He says, "Well, these men are making these pulleys by hand, not using these machines, and really, Mr. Briggs, I doubt very much if you can get them to use these machines." I said, "Mr. Fyfe, I don't believe that, really; these men in this shop have worked for me and with me before I was an employer for many years. I know all about these machines, and I do not believe that these men will refuse to go onto these machines." I said, "You try it again." So he tried it the next day, and back came the same report. I really did not know what it all meant, but I was going to give that thing a fair trial, so I

said to Fyfe, "You select the six best men there are in that shop and you put them on these machines one after the other and see what they produce." He said, "They don't want to go onto the machines; they don't want to do anything with the machines." I said, "All right, try them on the floor and see what that will do." So he tried them on the floor, and they produced three pulleys, no more and no less.

Then Mr. Fyfe said to me, "You know these men pretty well; they have worked for you and with you for many years. You go and talk to them." So I went in and talked to them. I said, "Charlie, what is the matter out here, anyway? I don't understand this." "Well," he said, "Mr. Briggs, I will tell you what the matter is. Since you have had this shop unionized they have told us to produce no more on these machines than I can without them." I said, "You don't mean to tell me that the union told you that?" And he said, "I certainly do." I said, "You used to produce on these machines well," and he said, "Yes"; and I said, "Have you any objection to it?" And he said, "No."

So I went down the line with these men that worked on these machines, and I got the same reply all along. So I thought of that a little while, and then I referred to this New York agreement under which we were operating, and I said to one of these men, who I subsequently learned was the chairman of the shop committee, "Now, George, let us refer this to these two national organizations and see what they are good for. You write to Mr. Fox and I will write to Mr. Letchworth, and we will see what we can do about this."

"Well," George said, "Mr. Briggs, I kind of hate to write that letter; I wish you would write to Mr. Fox. You know Mr. Fox." I said, "Certainly, I know Mr. Fox, and I have the highest regard for Mr. Fox. I will write to Mr. Fox if you will give me authority to say to him that I am writing at your request;" and he said, "All right." So I wrote him, and Mr. Fox sent up Mr. Kehough to look the situation over. Mr. Kehough came into the office, and I was very glad to see him, and I said, "Mr. Kehough, just straighten this thing out. I have these machines at a price that I made when I was getting six or eight a day, and now to put it down to three I am behind. Really, I can not do this;" and I said, "I think this is an unfair proposition here."

So Kehough went into the shop and came back to the office and said, "Well, Mr. Briggs, I think you had better abandon that idea." He said, "Telling you the plain facts, you know our association is very much opposed to this machine, this molding machine; we don't like it, and our men don't like to work on it, and I think you had better drop it."

I said, "Well, Mr. Kehough, that is pretty hard. If I drop out and make these pulleys the way you want to make them, that will cost me in the neighborhood of \$700. I don't believe you want me to do that; I really don't believe you want that, you are too good a fellow to do that." And he said he would take it up with the union that night.

The next day he said he could not do it; the men were very obstinate and would not work on that machine, and if they did, they would only turn out three, and they urged me to give up the idea. I said, "I don't propose to do that. I made no objection to unionizing this shop, but I did not suppose for a moment that that meant that I could not receive the benefits of the improved appliances that I might put in my shop for the purpose of reducing cost and for protection, and I have no disposition whatever to take these machines away from these molders. I have known these boys all my life; they are good fellows; and if you will go in and say to these boys, 'Go ahead and make these castings on these machines as they ought to be and get a fair day's work on these machines,'" and he said, "We will try once more," and the result was that he was around four days, and then he came to me and said, "Mr. Briggs, I am going back and refer this to Mr. Fox."

In the meantime I think he said, "We had better hold this conference open a little bit," he says, "I don't think we had better make an arbitrary ruling." I thanked him for that and I said, "But in the meantime I have got to get these pulleys out. This thing can not be prolonged here a long time," and I told him that we ought to have an announcement the very next morning, which we had, but I had quite a little difficulty with these men to hold them in; but I did hold them in; in fact, I held them in—I guess, about half of them—when one day they all quit, and I said, "Now, look here, boys, you can not quit under this New York agreement," and I took the agreement and read it to them, and dealing with these men personally—in my own personal way—and by the time the conference was held the pulleys were made; in fact, I do not think I had any more pulleys after that, so that was disposed of in that way.

Mr. VALENTINE. May I ask a question?

Mr. BRIGGS. I would prefer that you wait until I get through and I will answer. I know what question you are going to ask.

This pulley business ran along for about a year and the foundry was sold out to another firm and the workmen all went over, and the same question came up in very short order. That shop was struck and they had a bitter time about it—the Minneapolis Steel & Machinery Co.—on molding machines.

I want to repeat what I said yesterday, that our experience all along the line is that the molders will not operate a machine and that the reason they will not operate them is that they are so instructed from the officers of the Iron Molders' Union of North America. Had the Iron Molders' Union of North America been out of the way, I would have had these pulleys made, and made with molders at \$3.50 a day.

Commissioner O'CONNELL. Are they operating the machines to-day?

Mr. BRIGGS. In that foundry?

Commissioner O'CONNELL. The molders.

Mr. BRIGGS. It depends upon what foundry you go into.

Commissioner O'CONNELL. You say they will not operate them. Are they operating them at all?

Mr. BRIGGS. I didn't say that. I say they oppose the machine. I will add to that that whenever they are strong enough to strike a shop where they are forced to go on with these machines they will strike it. That is my experience.

Commissioner O'CONNELL. I understood you to say that they would not operate them, and now you say that they are opposed to it.

Mr. BRIGGS. Then, I will make that a little stronger. I did not understand your question. I say they will not operate these machines if they think they are strong enough to force their hand. That has been my experience. Of course, I am speaking from my own experience about that. And, again, I want to say that in that same respect I do think that these gentlemen make an awful mistake; that they will not go ahead and show the benefits of molding machines to get shorter hours.

Now, about the number of conferences which we have held.

If I understood Mr. Valentine correctly, he rather discredited my statement that we had held 2,500 national conferences. Have you the minutes, Mr. Chairman, of the interview of yesterday? My memory is that I said there had not been 2,500 conferences held nationally and locally, but when locally they were under the jurisdiction of the national association. I intended to say that. If I did not, I wish to correct that statement to-day. I believe that 125 of those occurred right in St. Paul and Minneapolis. We used to have conferences you know. The boys would write a letter in, or get a letter from you, Mr. Valentine, or from Mr. Fox, "have a conference together and do so and so," strictly under your instructions. I calculate that as a national conference. It is really so constituted, and it is those conferences that are included in the 2,500.

Commissioner O'CONNELL. If the chairman of the committee called at your office and said, "Hello," about something that occurred in the morning, you would call that a conference?

Mr. BRIGGS. No, sir, I did not. I call it a conference when the chairman of the committee comes in and says, "We will not do what the foreman asks us to do. Let us have the two committees get together and lay off for a couple of days."

Mr. Valentine made the statement that the officers of the National Founders' Association were not practical. I wish to correct you on that, Mr. Valentine, and I believe you will accept the correction. If you will remember correctly, the first commissioner of this association and the man who was commissioner up to the time I succeeded him, was Mr. John A. Fenton, a man who served many years as a molder, and many years a distinguished member of the Iron Molders' Union of North America. This same molder, Mr. Fenton, was the man who did the greatest amount of work at the inception of this association in securing an organization of the National Founders' Association, and he was a practical molder. Added to that, I want to say that wherever it was possible for this practical molder, Mr. Fenton, to attend these conferences, he always attended them. I think I am correct about that, Mr. Valentine.

Again I want to call your attention to the fact that these national conferences, which has been in discussion here so much, were usually attended by such men as Mr. A. C. Persanno, who is a mechanic by trade and came up from the ranks; and also by Mr. Phaler—and Mr. Phaler, by the way, was one of the originators of this association, I think. Mr. Phaler had interests in shops

which were members of the National Founders' Association as well as the Stove Founders' Defense Association, and, if I remember correctly, he was quite a practical man.

We always aim to get to these conferences men who were practical and who did know something about the art and skill and trade of molding. I think, upon reflection, Mr. Valentine, you might perhaps wish to change that.

Another point Mr. Valentine made this morning was that the foundry men would always adjourn the meeting too promptly. I wish to call attention to the provisions of this New York agreement, which perhaps we have not before us, but which provides for an equal number on each side, and it is therefore impossible to adjourn this meeting, strictly impossible, until one or the other shall come over. We deadlocked time and time again and could not adjourn. One side would say, "I guess we had better adjourn," and the other side would say, "No; let us go on." It was three and three right alone, and those conferences were prolonged many times when one side had completely exhausted their efforts and the other side would insist on going on. I believe in all sincerity that so far as that question of giving these matters attention, the foundry men themselves, every one of them who went into these conferences—and I am going to submit the names of those gentlemen here pretty quickly, if the commission will permit me—entered into these conferences in a spirit of fairness and with a determination to reach an amicable end. I want to say in behalf of those men, every one of them that sat upon these conferences in the years that I attended them, that they did make a straightforward, honest, conscientious, and sincere effort to meet you gentlemen on the same basis of conciliation, which you, Mr. Valentine, and you, Mr. Frey, have so beautifully illustrated here.

I want now to come to a statement here in regard to wages and hours having constituted the differences upon which we broke and by reason of which, as I understand the gentleman who preceded me, they placed greatest stress.

Mr. Taylor, will you give me a couple copies of the Iron Molders' Journal?

(Mr. Taylor handed certain papers to Mr. Briggs.)

Mr. BRIGGS. I wish to call your attention to this journal, which is the official organ of the Iron Molders' Union of North America. I read that journal years ago with a great deal of interest. I used to have it every day and I think Mr. Valentine was the man who sent it to me. I do not know; I asked him to do so once, and he said he would.

Mr. VALENTINE. Do not you get it yet?

Mr. BRIGGS. I do once in a while; and as a matter of fact that I have so much else to attend to that I do not have time to read it.

Mr. VALENTINE. You cut me off your list.

Mr. BRIGGS. Do you want it—do you want the Review?

Mr. VALENTINE. You bet I do.

Mr. BRIGGS. Mr. Taylor, will you see that Mr. Valentine has the Review? I supposed he did have it. The Review is for the benefit of all people interested in labor.

Mr. VALENTINE. I want to be educated.

Mr. BRIGGS. You shall have all you want of them.

Getting back to this Journal, I call your attention, gentlemen, to the fact that this Journal is of May, 1906, about a year and a half or two years subsequent to the abrogation of the New York agreement. In 1906 there came a show-down in this struggle we have been talking about. It went all over the country. They struck a whole lot of shops. I will talk about them a little later, but this journal from which I am quoting is for the sole purpose of supporting a statement I made here yesterday that the contentions over which we were laboring and on which we could not agree were not wages and hours. I will read from this journal, at page 357, as follows:

"For the past two years the organization as a whole has been marking time, and the large and costly strikes supported had not been entered into for the purpose of securing higher wages or shorter hours, but with the object of resisting the foundry men's efforts to take away from the molders a portion of the conditions they had already secured."

I assume that is from your pen, Mr. Frey?

Mr. FREY. Read it all, and then we will take it up.

Mr. BRIGGS. Suppose we submit the whole Journal? I am willing to read the whole thing.

Mr. FREY. Make your point, and I will reply.

Mr. BRIGGS. I submit the Journal.

Mr. FREY. Let me have that, because that is very unfair.

Mr. BRIGGS. Again, I want to refer to the official organ of the iron molders' union for September, 1907, a year later, in which Mr. Valentine, in addressing his convention at Philadelphia, I believe, under the subject of "Relations with the National Founders' Association," stated as follows:

"Although there is no official relationship between the N. F. A. and the I. M. U. of N. A. at the present time, I believe that reference should be made to that period when it existed, and particularly so to the substance of the joint conferences held with the object of providing some general form of agreement that would regulate the relations to exist between the foundry men and molders. For several years efforts were made by both parties at interest to reach some common ground on which could be established a general form of agreement. The far-reaching value of such an instrument to both associations was generally recognized and conscientious efforts were made by the representatives of both bodies to assist in drafting an agreement which would conform to the mutual welfare and meet with the sanction of a majority of the membership of both associations and that would also provide for the regulation of many of those questions which previously had been the cause of misunderstanding and contention.

"Several national conferences were held with this object in view between October, 1902, and April, 1904, but instead of tending to develop a common ground on which the foundation for a general form of agreement could be laid they developed wider differences of opinion, until at the conference of April, 1904, it became evident after several days of discussion that, for the time at least, a general form of agreement between the two associations was impossible.

"The main questions that had been at issue, and which were finally presented in concrete form by the N. F. A., applied to the limitation of output, the ratio of apprentices, the employment of handy men, the operation of molding machines, and the minimum wage rate. It was the foundry men's desire that if a general or national form of agreement was consummated it should provide for the unrestricted employment of apprentices and handy men, and should leave the method of operating molding machines optional with the foundry men, and should further provide that a percentage of molders employed in each foundry should be allowed to work for a definite rate below the minimum. To these propositions we were unable to agree, though there were several questions in addition to those just mentioned upon which mutual understanding had been reached, and it was my belief that progress would have been made had these been adopted as the foundation for a general form of agreement. This view was not acceptable to the representatives of the N. F. A., who held that unless an agreement could be reached which would include in its provisions those conditions which had been expressed in their propositions as submitted; it would be of no avail to have any national form of agreement."

Gentlemen, I call your attention to the fact that in Mr. Valentine's report to his union the only reference that is made in there to wages and hours is a question of minimum wage rate, and I submit to you, gentlemen of the commission, that my statement of yesterday was correct.

I would like to take up violations of the New York agreement now. Mr. Taylor, have you the list of some of those?

(Mr. Taylor handed a paper to Mr. Briggs.)

Mr. BRIGGS. In this last conference, to which Mr. Valentine refers in that report, and to which I have referred and propose to refer to again, we were asked to submit some statements of why the iron molders' union had broken their agreements, both the New York agreement and the agreement locally, and we submitted a list of some 40 or 50, among which was a reference to an agreement attempted between the Iron Molders' Union of North America and our members in Chicago in 1901.

An agreement was made between the National Founders' Association and the iron molders' union for Chicago and vicinity at \$2.65 and \$2.85 for floor and bench. The local union refused to abide by this contract and went on strike July 15, 1901. The international union apparently made every effort to discipline the Chicago members, but it availed nothing and they continued on strike for over a year. In July, 1902, while the strike was in progress, the convention of the iron molders' union met in Toronto. The Chicago union presented a bill for \$5,000 for expenses incurred in conducting this illegal strike. A resolution was adopted allowing the \$5,000 and agreeing to sanction

their grievance if the Chicago conference board would declare the independent strike off.

That is a sample, gentlemen, of some of the agreements which these gentlemen can not live up to. I think they made an honest effort to have their men live up to this agreement, but they would not do it. The point to which I wish to call your attention is the fact they did not discipline them. They called a convention and were asked for \$5,000, and the iron molders' union gave it to them.

I want to read a letter in regard to that. I read it for two purposes—first, its bearing upon this particular case; and, second, because it was written by that friend of your's and mine and the whole crowd, Mr. Valentine, Mr. H. W. Hoyt, when he was president of this association, and who is now vice president of the Great Lakes Engineering Co., at Detroit, one of the ex-presidents of this association, a man who devoted an enormous amount of time in an effort to agree with these gentlemen. This letter was dated July 19, 1901, and reads as follows:

Mr. MARTIN FOX,
President I. M. U. of N. A., Cincinnati, Ohio.

MY DEAR SIR: A very serious question regarding the extent of the authority of the executive board of the Iron Molders' Union of North America has arisen in my office this afternoon.

I have had the honor and the pleasure of a call from two of your members in this city, to whom I have read your letter of July 12, accepting on behalf of your executive board, the wage scale in the city of Chicago of \$2.65 per day for bench molders and \$2.85 per day for floor molders.

It is represented to me that the understanding of the molders in the city of Chicago is that the decision of your executive board is not binding upon the organization in the city of Chicago, but is, as they understand it, simply a recommendation for acceptance.

I am also informed that Mr. Keough has not made your position clear to the molders in this city, and that he has not, as a matter of fact, insisted that the action of your board was final and binding upon the members in this city, instead of merely a recommendation.

I have discussed this matter with the gentlemen who have waited upon me, at some length, and have stated to them that I have never heard the authority of your executive board in such a case questioned.

In order that I may be thoroughly advised myself, I respectfully request that at your earliest convenience (which I trust will be by return mail) you will clearly define the extent of the authority of your executive board in such a case.

I will also ask permission to read your letter in reply to this to the gentlemen who have waited upon me this afternoon.

Under all the circumstances, I trust you will pardon me if I offer the suggestion that your own presence is needed in the city of Chicago to fully define the authority of your executive board. I believe that if the molders of the city of Chicago could have such an explanation as I have outlined matters would clear up immediately in this troubled district.

The gentlemen who waited upon me presented the following form of an agreement which they claim Mr. Keough recommended and advised should be presented to the George Pyott Foundry Co. I would like to have you read the same and give me your opinion of it. My own thought about it is that Mr. Keough has not clearly defined the situation, and by such a letter has greatly complicated existing difficulties. The letter which I have had copied verbatim is as follows:

“CHICAGO, July 19, 1901.

“*To committee representing the molders in Geo. Pyott's Foundry Co.*

“GENTLEMEN: This company agrees to pay the molders the sum of three dollars (\$3) per each day's work commencing July 15, and until a fixed rate of wages is determined which is now in dispute amongst the molders and the manufacturers. We then agree to pay the wages thereupon decided.

“Trusting I may have your early reply, I remain,

“Very truly, yours,

“ (Signed)

H. W. HOYT,
“*President, N. F. A.*”

As I have already stated, undoubtedly Mr. Fox did everything he could to cause these men to live up to that agreement; but they did not live up to it. If I remember correctly there were some dozen or fifteen shops involved, and, if you will remember, that strike was pretty bitter. That is the case which we claim was very vital in discouraging our people very much in attempting to deal with this union. They did not live up to those agreements.

I want to refer to the Utica case, which Mr. Valentine and Mr. Frey and myself have referred to. I would like to call attention to the fact that this difficulty over the Utica situation occurred in the spring of 1904. The difficulty began, I assume from what I found out later on, perhaps years before. At this particular date, when this was on in the spring of 1904, I had just taken the position of commissioner of the National Founders' Association. As commissioner of that association many of these difficulties that had arisen prior to that date did not come before me as an officer of that association, although I had served as committee man many, many times. I want to detail that a little bit.

When I went into this office and looked matters over no special attention was called to my mind about the Utica situation, until one day Mr. Keough called me up and told me that the Utica molders were all on a strike and I had better go over there. I said, "What is the matter?" He said, "Of course, there has been trouble brewing there for some time, and the molders are all out, and you had better go over." Understand, gentlemen, this was after we had conference after conference after conference over a period of practically seven years. I was just coming on. We had tried, as I have stated to you, honestly and conscientiously to pattern the methods of our association by the Stove Founders' Defense Association, and as I went up into this situation I could see clearly that relations were getting a little strained. In fact, they were infinitely more strained than I had had any idea they were when I accepted that position. Imbued with that idea, I felt I should handle that case with the greatest degree of caution. It was the first big one I had to handle by virtue of the office I held, and I wished to approach it with extreme care. I went over to Utica and spent a couple of days there in investigating the matter. Mr. Keough declined to go with me, which was quite a disappointment to me, just having come into that office; but it was all right. I thought I would go over and look that situation over.

At this point I want to call your attention to this New York agreement, which provides:

"That in the event of dispute arising between members of respective organizations, reasonable efforts shall be made by the parties directly at interest to effect a satisfactory settlement of the difficulty."

Interpreted, that means that employer and employee shall use their best efforts to settle that difficulty without its reference to either of these organizations. I think these gentlemen will agree with me that is a correct interpretation of that clause.

This New York agreement further provides:

"Pending adjudication by the committee of arbitration, there shall be no cessation of work at the instance of either party to the dispute."

The condition as I found it when I got over there was this: These people had settled their difficulties some time before that. The question that had been of considerable moment in that case was the question of improved appliances, usually covered under the head of "molding machines," by reason of which they thought they had been able to effect a reason for modification in the piece-work prices of that shop. Their character of work in that shop was similar to that in the Stove Founders' Defense, but they were not members of the Stove Founders' Defense.

They told me that they had adjusted the difficulty, and the men told me the same thing. I got to the men themselves. I did not take the proprietors' word for it. I always like to get out and get acquainted with those men. There is nothing I enjoy more than getting out and getting with my men and settling these questions. Half a dozen men said, "That is all settled if you will take the 'national' out of it." Then I go back to the proprietors, and I look over their pay roll, and they exhibit these wages for a month or six weeks, and I said, "Here is certainly a difference of opinion. Here is a chance to apply the New York agreement." One of the advantages of the New York agreement is that the men shall not go out. Before it was ever referred to me at all the men went out. I went back and talked this over with my board and talked it

over with Mr. Keough and Mr. Valentine, and said, "Here, put your men back and comply with the New York agreement, and we will have a conference." Believe me, gentlemen, we could not get a conference. They denied it absolutely.

Subsequently there came up the question as to whether I had the right interpretation of that New York agreement or not, and, it being one of my first cases, I thought that I would just refer that to an ex-president of that association, one of whom everybody had the greatest respect for; and it pleased me very much to know that Mr. Frey and Mr. Valentine had quoted them here today. You will recall the conference that Mr. Frey referred to, wherein an interpretation was put on the New York agreement; and Mr. O. P. Letchworth was one of those gentlemen—a man who spent an enormous amount of time and energy in endeavoring to have peace. When the question came up that I had not done the proper thing, I wanted an ex-president on this thing, and so I wrote Mr. Letchworth a letter and asked him if he would give me his opinion in regard to this. I wanted to know whether I was right or wrong. I have here the correspondence with Mr. Letchworth, and I should like to read it. It is as follows. This is dated Buffalo, N. Y., October 18, 1904. This was in October, about the time of that conference. I do not recall the date. This letter is as follows:

PRATT & LETCHWORTH CO.,
Buffalo, N. Y., October 18, 1904.

O. P. BRIGGS,

Commissioner National Founders' Association, Detroit, Mich.

MY DEAR MR. BRIGGS: Referring to the conversation recently had with you in Cincinnati relative to the situation in Utica, and after hearing the statements presented at that time, I beg to say that I do not see how there can be any criticisms made on the part of the molders' union that the officers of the National Founders' Association in any way violated the provisions of the New York agreement in that case.

The purpose of the New York agreement is to prevent strikes and lockouts, and a method is provided whereby either party who perchance may be dissatisfied and feel that they have cause for complaint, can ask for a conference to pass upon the point in question, which conference should be held within two weeks.

The New York agreement was not framed for the purpose of establishing any fixed policies, nor for the purpose of preventing the introduction of such changes as in the judgment of the employer might seem proper, but was created to afford opportunity for each side to be heard upon the subject in dispute and, if possible, reach an adjustment of the issue without resort to strikes or lockouts.

In Utica the men, it appeared, were not satisfied with the proposed reduction in their pay, but continued at work and accepted the reduction under protest until ordered out by their national officers.

This was clearly a dispute between employer and employee, which dispute, under the terms of the New York agreement, entitled the aggrieved party to ask for a conference, in the hope of reaching an amicable settlement before the men should strike or the employer should lock them out.

I am informed that the foundrymen were perfectly willing at that time to submit the entire matter to a conference and abide by the result.

The issue here was clearly defined, but the New York agreement was entirely ignored when the men were ordered on strike. It was a question of difference between the molders and their employers, and had the former carried out the provisions of the New York agreement their duty would have been clearly and specifically defined, i. e., that they should have asked the president of the National Founders' Association for a conference to consider the question, and it would have then been the duty of the president to appoint such a conference.

This the molders did not do, and the record does not show that such a request was ever made to our association; in fact, Mr. Keough admitted this to me at Cincinnati last week, and I then stated to him, as you will remember, that this was where he made his fatal mistake.

In my opinion, the trouble at Utica has been brought about entirely because of the failure of the officers and members of the molders' union to comply with the terms of the New York agreement and call for a conference to decide upon the conflicting claims before the men should be called out. Both sides

were agreed that a dispute existed, and the natural sequence was a conference as provided by the agreement.

The criticisms made by the union of the action of the National Founders' Association and its members in Utica, it seems to me, are not sustained by facts.

Very truly, yours,

O. P. LETCHWORTH.

I submit that, gentlemen.

(Informal conversation between members of the commission and the witness ensued at this point.)

Mr. BRIGGS. I understand, Mr. Chairman, that you want to stop now?

Commissioner COMMONS. We want to stop in half an hour.

Mr. BRIGGS. Do I understand that I am refused to complete my reply to statements of the representatives of the union? I do not think I can do it in half an hour. I am in your hands, gentlemen. There have been some very serious charges made here, and I feel, on behalf of the men that I represent, that I should reply to these statements. I have said several times that I represent 350,000 men, and that I think I ought to be heard.

Commissioner O'CONNELL. How many men did you say there, that last time?

Mr. BRIGGS. I say the members of this founders' association must comprise at least 450,000 men.

Mr. THOMPSON. It has been suggested here that perhaps it might be satisfactory to Mr. Briggs if he would submit what we call in the law a brief, a statement of facts, to this commission, either in typewriting or in print, and in that way he could cover the entire field, and could do it at his leisure, and we could still make our dates on our calendar. We have already taken two days for one day's allotment.

Mr. BRIGGS. The disposition of this association is to comply with your wishes, to the letter.

Mr. THOMPSON. Would that be satisfactory to you?

Mr. BRIGGS. It will be satisfactory if, after we submit that brief, we may have a little opportunity some time before you draw your conclusions, to have an hour of argument before you. I do not think I should be representing my people as I should represent them, if I did not file that request.

Mr. THOMPSON. We will have meetings in various cities. Where would you like to present that argument?

Mr. BRIGGS. Where it is most convenient to this commission.

Commissioner COMMONS. According to your suggestion, then, we might have briefs from both sides, and rebuttals, and when the briefs are put in the commission will get acquainted with them, and then make some special appointment, in the West, in Cincinnati or St. Paul, or somewhere else, where the matter could be thrashed out.

Mr. THOMPSON. Chicago might be a convenient meeting point.

Mr. BRIGGS. So far as I am concerned, very much so; but I will make that place at the convenience of this commission. I will go around the world, if you call us there.

Mr. THOMPSON. I should like to go around with you.

Mr. BRIGGS. Thank you.

Commissioner COMMONS. Are you willing to pursue that course?

Mr. VALENTINE. We have always been willing to follow the members of the N. F. A. wherever they went.

Mr. BRIGGS. Except in the open shop.

Commissioner COMMONS. Would you be willing, with that understanding, to close the hearing at this point?

Mr. VALENTINE. I just want to ask him three questions.

Mr. BRIGGS. May I ask him three more afterwards?

Mr. VALENTINE. Yes.

Mr. BRIGGS. That is our practice.

Commissioner COMMONS. I do not like to break up a friendly conversation between you two.

Mr. VALENTINE. We have not gotten together for five years. This is the first chance we have had.

Commissioner COMMONS. Well, we will sacrifice something to have you get together a little.

Mr. VALENTINE. Mr. Briggs made this statement about this molding machine. What kind of a molding machine is that?

Mr. BRIGGS. Which one?

Mr. VALENTINE. The one you referred to. The pulley machine.

Mr. BRIGGS. It is a Treadmore, I believe. No; it is a Delano pulley machine.

Mr. VALENTINE. Is it run by hand?

Mr. BRIGGS. Yes.

Mr. VALENTINE. The only thing about it is that it draws the pattern?

Mr. BRIGGS. It draws the pattern. It has a little device over it to assist in throwing off the flash.

Mr. VALENTINE. And you said that the men would not work on that machine?

Mr. BRIGGS. I did.

Mr. VALENTINE. I want to answer what you said, that, if all that you said are the facts in the case, I think you have had a very bad deal on that proposition.

Mr. BRIGGS. I thank you.

Mr. VALENTINE. If that is all true.

Mr. BRIGGS. I can prove it.

Mr. VALENTINE. I want to make a personal investigation of that. Will you permit me?

Mr. BRIGGS. Certainly. Start in with Mr. Keough, your vice president.

Mr. VALENTINE. And I want to report the results of that investigation to this commission.

Mr. BRIGGS. I will assist you all I can.

Mr. VALENTINE. That is satisfactory.

Mr. BRIGGS. Thoroughly.

Mr. VALENTINE. Who was this man you approached that you called Charlie a while ago?

Mr. BRIGGS. Charlie Peterson was one of the men, and I think Anderson was one of the other men's name.

Mr. VALENTINE. I just wanted to know who Charlie was.

Mr. BRIGGS. There were six of them. I do not know whether those old time books are intact or not. The Queen City Iron Works were sold. I can get you the names of everyone of those men, though.

Mr. VALENTINE. I will ask you a question. Are you still a member of the National Founders' Association?

Mr. BRIGGS. Yes.

Mr. VALENTINE. Do you mind telling me whether the policy that you carried out before, to investigate grievances before you sustain your members, is still the policy that is followed?

Mr. BRIGGS. It was so long as this agreement was in force. So long as this New York agreement was in force I think we lived strictly up to the law.

Mr. VALENTINE. Do you have any different policy now when a grievance arises?

Mr. BRIGGS. I do not quite understand that question.

Mr. VALENTINE. I mean, if a member has a dispute now, do you use the same policy that you used to of investigating to see who is right?

Mr. BRIGGS. We can not do the same as we did before, because our official relations with the founders' association and the International Molders' Union were interrupted in 1908.

Mr. VALENTINE. Before you pay these men any money do you try to find out whether they are justified in bringing about a strike in their shop or whether we brought it about?

Mr. BRIGGS. I do not quite understand that; but if I do understand it, it is this: In case of a difficulty in a foundry, and the foundry applies for the support of the National Founders' Association, does the National Founders' Association investigate that case?

Mr. VALENTINE. Yes.

Mr. BRIGGS. I answer that "yes"; they do to the greatest degree possible.

Mr. VALENTINE. Are you supporting the Flower City Ornamental Works?

Mr. BRIGGS. The Flower City Ornamental Works are not members of this association.

Mr. VALENTINE. They are not members?

Mr. BRIGGS. No, sir.

Mr. VALENTINE. They used to be very prominent members, but I do not know.

Mr. BRIGGS. Quite so, but they are not now.

Mr. VALENTINE. Mr. Tetroff told me last week that the foundry men of St. Louis and Minneapolis were behind him and he had locked out our men, and they were going to lock out all the molders in St. Paul.

Mr. BRIGGS. I can not answer for Mr. Tetroff. I have not had a word with him in any way, shape, or form. That company is not a member of the association, and there is no reason why he should come before us.

Mr. VALENTINE. No; I know he is talking through his hat. That is all.

Commissioner DELANO. When you had that trouble about making pulleys, were your men being paid daywork or piecework?

Mr. BRIGGS. Piecework.

Commissioner O'CONNELL. Using the word "arbitration" in what is spoken of as the New York agreement, you meant by that conciliation, and not the appointment of an umpire?

Mr. BRIGGS. Yes; that was the interpretation in the New York agreement. They would never consent to the odd man.

Commissioner O'CONNELL. You do not mean arbitration in the sense of having the odd man?

Mr. BRIGGS. No, sir.

Commissioner O'CONNELL. How many molding machines have been introduced in the foundries?

Mr. BRIGGS. Since that date?

Commissioner O'CONNELL. Yes.

Mr. BRIGGS. It is impossible to answer that question. There have been an enormous number.

Commissioner O'CONNELL. You believed that the introduction of the machines would be one of the things that would reduce the hours of labor?

Mr. BRIGGS. Yes.

Commissioner O'CONNELL. Has it had any effect in that direction?

Mr. BRIGGS. The hours of labor have been tending downward all through that entire period. I do not know what hours prevail now in these foundries, beyond what I stated yesterday. I stated I thought the average was about 9 hours, and of course many of these men do not work 9 hours. They quit when they pour off their heat, and perhaps they work only 7 or 8 hours. There is considerable latitude about a man getting through, and if the heat has to be taken off before he has worked quite as long as he ought to, he quits then.

Commissioner O'CONNELL. There has been nothing to the effect that the hours were going to be reduced one hour a day or a half an hour a day as the result of the introduction of the machine; no notice of that kind?

Mr. BRIGGS. No; we do not post that kind of a notice in our shops.

Mr. FREY. Before we adjourn, I want to have the floor for a minute.

Commissioner COMMONS. Is there something that you want to state?

Mr. FREY. No; I want to call attention to statements made before the commission.

Commissioner COMMONS. It has reference to this testimony?

Mr. FREY. Yes; to the testimony of Mr. Briggs.

Commissioner COMMONS. Very well.

Mr. FREY. The unfortunate part of it is that I fear the discussion has drifted away from the point I wanted to make, of the cause of the inability of the molders' union to maintain friendly relations with the National Founders' Association, and I want to read you some quotations. These quotations are taken from the journal. A few lines of this Mr. Briggs has just read:

"For the past two years the organization as a whole had been marking time, and the large and costly strikes supported had not been entered into for the purpose of securing higher wages or shorter hours"—

That is used for the purpose of creating the impression that these strikes were for the purpose of getting something else—of getting machines, and so on. I continue reading—

"had not been entered into for the purpose of securing higher wages or shorter hours, but with the object of assisting the foundry man's efforts to take away from the molders a portion of the conditions they had already secured."

This was written in 1906, two years after the strike.

I read further:

"Since the abrogation of the New York agreement and the adoption of a hostile policy by the N. F. A., many members of that association, counseled and encouraged by their officers, had endeavored to force reductions of wages, and the 'open shop' upon all members."

Had the whole thing been read, an entirely different impression would have been made.

Mr. BRIGGS. May I ask that that whole Journal be presented. There are two pages of that. I should like to answer that, Mr. Chairman, and I do want to emphasize the point that our relations with the iron molders' union while that New York agreement was in force were of the most cordial, and that we made the very best efforts possible for all those years; and that at the end of that time our patience was exhausted. The Stove Founders' National Defense Association, as Mr. Valentine said, has trifled with that proposition for 10 years, and has not got a decision yet. To paraphrase Mr. Valentine a little, if he had waited 10 years for the doctor we would have been dead.

Commissioner COMMONS. We are very much obliged to you, Mr. Briggs.

Mr. BRIGGS. Thank you, Mr. Chairman.

Mr. FREY. I want to make another correction while Mr. Briggs is here.

Commissioner COMMONS. A correction?

Mr. FREY. Yes; so that the record will be accurate. On the question of the molding machine, Mr. Briggs made the statement that he believed that our officers had advised the members not to operate molding machines. Briefly, let me state our position for ourselves. At our convention in 1899 we adopted a new law which provided that our members should endeavor to secure control of the molding machine, should work on the machine; shortly after this New York agreement was entered into, so that that was the official policy. Since that date we have continuously made efforts not only to have our members operate those molding machines, but to take up with the foundry men the question of what the prices should be. I want to say that emphatically, and positively, there is no opportunity for making any contradiction to this, that our invariable policy since 1899 has been to operate this molding machine.

In the second place, it is a minor matter, it is true, that there is one type of molding machine that decreases the degree of manual labor. The ordinary molding machine is not a jarring machine, and where the ordinary molder made 75 by hand, he now makes 150, but he shovels twice as much sand, and has twice as much work to shake out, so that the molding machine has increased the manual labor.

Mr. BRIGGS. In most cases the helpers do the molding and shovel the sand and the molder does not.

Commissioner DELANO. I want to correct an impression that we may be getting in the record, there, that your organization not only furthers, but encourages the use of the machine in preference to handmade molds.

Mr. FREY. No; no.

Commissioner DELANO. I should not think so.

Mr. FREY. We do not encourage the use of the machine; but we had a number of agreements entered into before Mr. Briggs became commissioner, in which we agreed that the molding machine should be introduced into the foundry without any objection on our part, and yet the commissioner comes now and says we objected to it, when we entered into those agreements with the association. We can submit a hundred of those original agreements in which we agreed that we would not make any objection to the introduction of molding machines.

Mr. BRIGGS. Then when the machines were put in, they would not do the work.

Commissioner COMMONS. The hearing of the rest of the witnesses on our calendar will be proceeded with at 10 o'clock to-morrow, and those who are down for Wednesday have been telegraphed, I believe, to come on Thursday, instead, so that we will devote to-morrow to the program of Tuesday.

(Whereupon, at 6.20 o'clock p. m., the commission adjourned until to-morrow, Wednesday, April 8, 1914, at 10 o'clock a. m.)

WASHINGTON, D. C., *Wednesday, April 8, 1914.*

The commission met at 10 o'clock a. m. in the assembly room of the Shoreham Hotel.

Present: Commissioners John R. Commons (acting chairman), Mrs. J. Borden Harriman, Frederic A. Delano, Harris Weinstock, S. Thruston Ballard, John B. Lennon, and James O'Connell.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. B. M. Manly, superintendent Division of Industrial Investigation; and Mr. F. H. Bird, superintendent Division of Public Agencies.

The ACTING CHAIRMAN. The commission will come to order. Mr. Thompson, will you call your first witness on the clothing question?

Mr. THOMPSON. I will first put on, Mr. Chairman, witnesses with reference to the Chicago proposition. In order to facilitate the taking of the evidence in regard to the firm of Hart, Schaffner & Marx, and their trade agreement, I have prepared a list of questions in regard to that matter, and those questions have been furnished to Mr. Schaffner, and he will answer those questions specifically in order to come right to the point.

Mr. Schaffner, will you please take the stand?

TESTIMONY OF MR. JOSEPH SCHAFFNER.

Mr. THOMPSON. For the purposes of the record, will you please state your name, residence, and business?

Mr. SCHAFFNER. My name is Joseph Schaffner; residence, Chicago. I am secretary and treasurer of Hart, Schaffner & Marx, a corporation in the clothing business.

Mr. THOMPSON. What is the nature of the business of Hart, Schaffner & Marx?

Mr. SCHAFFNER. We employ about 6,000 people in our manufacturing department, most of them of foreign birth, and 65 per cent female. A great many of them are recently arrived immigrants of all nationalities. The most numerous are Jews, next Poles and Bohemians, the next Italians.

All the work is done in our own shops; no contracting for a number of years. The work is minutely subdivided into sections, there being about 150 sections of work on a suit of clothes. Accordingly, the task of each workman is very small. Each person's work on a garment ranges from 1 to 45 minutes.

Mr. THOMPSON. What were the conditions prevailing in your shops prior to 1911?

Mr. SCHAFFNER. There was very little organization among the employees, except the cutters. We had had an unfortunate experience with the cutters' union, due to what we thought was their arbitrary and unreasonable restrictions several years before.

The description of the situation in the copper industries prior to the strike, by Mr. Luke Grant, an agent of this commission, an advance draft of which happens to have come to my attention, fits our condition at that time so well that I suspect it is rather a common situation. I will quote from that statement:

"Careful study of the situation has led me to the belief that the fundamental cause of the strike is that the workers had no satisfactory channel through which minor grievances, exactions, and petty tyrannies of underbosses, etc., could be taken up and amicably adjusted. Taken separately, these grievances appear to have been of a minor character. They were, however, allowed to accumulate—to go on from month to month and from year to year—without any intelligent and sympathetic action on the part of the mine owners and superintendents to see that these little wrongs were righted. The result was that there steadily grew up in the minds of many a feeling of distrust and enmity toward their immediate superiors in position, because they felt that justice was being denied them. If they had had the temerity to complain against a shift boss, they incurred his displeasure, and his word was taken in preference to theirs. In some instances they lost their jobs, and where this was not the case they seldom received any satisfaction."

Shortly before the strike I was so badly informed of the conditions that I called the attention of a friend to the satisfactory state of the employees. It was only a few days before the great strike of the garment workers broke out. When I found out later of the conditions that had prevailed, I concluded that the strike should have occurred much sooner.

Mr. THOMPSON. What effect had the strike upon the labor policy of Hart, Schaffner & Marx?

Mr. SCHAFFNER. During the first two weeks of January, before the first agreement to arbitrate was signed, we had approved a plan for future handling of labor matters which anticipated a great deal of what has actually developed. I have a copy of a report dated December 24, 1910, from which I will quote as follows:

"This idea (to guarantee to employees a hearing for all grievances and justice for their complaints) suggests something in the form of a court, consisting of the representatives of the workmen and of the firm. They should

sit at regular times to hear all complaints and redress grievances. In case they should not be able to agree, an outside third man or a board of arbitration should act as a sort of court of appeals, whose decision should be binding on all parties. To reassure any who might fear to jeopardize his position by appearing as complainant, a complaint or suggestion box might be provided.

"Unless there were some vital objections, it might be wise to make no opposition to any voluntary efforts of employees to organize or join unions, and then by every possible means to render such organization unnecessary.

"It (the plan suggested above) might make shop discipline easier and lead to improved and more economical methods, because of the increased good will of the employees."

These ideas were put into practical effect within a month of the close of the strike and before the arbitrators had met. We created a grievance department, with instructions to work out a detailed plan along these general lines.

Mr. THOMPSON. What were the developments of the past three years in adjusting the relations between the company and its employees?

Mr. SCHAFFNER. I have placed in the hands of the members of the commission a booklet describing in full the development of our relations with our employees from the close of the strike up to the present time.

Prof. Howard, who is here, is thoroughly acquainted with all the details of this development, having been our representative for three years in dealing with our employees.

Mr. THOMPSON. What are the most important factors in producing the results?

Mr. SCHAFFNER. A summary of the essentials of the system which has produced such gratifying results in our institution would include a labor department responsible for industrial peace and good will of the employees, thereby of necessity fully informed as to their sentiments, their organizations, and really representing their interests in the councils of the company; a means for the prompt and final settlement of all disputes; a conviction in the minds of the employees that the employer is fair and that all their interests are safeguarded; consequent instruction of the leaders and people in the principles of business equity, thus gradually evolving a code accepted by all parties in interest, serviceable as a basis for adjustment of all difficulties; the development of efficient representation of the employees; honest, painstaking, dignified, reasonable, eager to cooperate in maintaining peace, influential with their people, and truly representative of their real interests; a friendly policy toward the union so long as it is conducted in harmony with the ethical principles employed in the business and an uncompromising opposition to all attempts to coerce or impose upon the rights of any group or to gain an unfair advantage; and a management that guarantees every man full compensation for his efficiency and prevents any one receiving anything he has not earned.

Briefly expressed, it is simply the natural and healthy relation which usually exists between the small employer and his half dozen workmen artificially restored as far as possible in a large-scale business where the real employer is a considerable group of executives, managing thousands of workers according to certain established principles and policies.

I am personally much concerned that it become very clear to everybody that the successful result of these developments has depended much less upon the formal and external features than upon the spirit with which it has been worked out. I am not able to say how far the success is dependent upon the men who have been instrumental in developing it.

I wish to speak in the very highest terms of the arbitrators and the chairman of our trade board, and also of Mr. Hillman, who developed wonderful influence over all people who came in contact with him on account of his high ideals, his patience under trying circumstances, and his indomitable faith in the ultimate success of right methods.

Mr. THOMPSON. Mr. Schaffner, has the preferential shop been satisfactory?

Mr. SCHAFFNER. So long as the unions are working toward the ideal we aim at; that is to say, justice toward every interest connected with the institution and the highest economic efficiency, which is the same as saying performing duty toward everybody, inside and outside of the institution, employees, stockholders, customers, and the general public, we wish to see them strong. We are willing that our board of arbitration should decide just what justice is and are willing to accept their interpretation.

Because there is no guaranty that those who control the unions (which are often not representative of the members) will hold to this ideal we do not

care to be committed to the "closed shop." If such a change should come, we would be required to restrict the power of the unions as far as we could.

The preferential shop, as we understood the agreement when we signed it, would not compel us to do injustice to any nonunion employee, nor to impair the efficiency of the shops. We believe that Mr. Williams has shown rare wisdom and has usually accomplished justice in administering this agreement. The tailor shops were 80 per cent organized. The weakest point is the trouser shops, where the people were for a long time misrepresented, and hence largely hostile to the union. The shops are nearly 40 per cent nonunion.

Inasmuch as the unions have thus far shown their acceptance of the idea of fair and reasonable dealing, as laid down by the board, we regard the agreement as having been highly successful.

Mr. THOMPSON. What is your opinion of collective bargaining?

Mr. SCHAFFNER. I believe that the officers of a corporation are trustees of the interests of all connected with the institution. Decisions affecting the interests of any group should not be made until such interests have the opportunity to present their case. Where there is any doubt as to the fairness of any decision or policy, there should be a disinterested tribunal to review the decision.

In my opinion the chief cause of hostility and bad feeling between the employer and employee is the usual lack of any means for determining what is right or what is wrong—that is, the lack of a common code or disinterested authority whose judgment is respected by both sides. Disputes once settled, even if one side loses, are seldom the cause of trouble. It is the unsettled disputes that are dangerous.

Mr. THOMPSON. I should like to ask you a further question. In the trade board which exists under the contract between yourself and the unions, and also the board of arbitration, which exists under the contract, is there an independent umpire or third man, so called?

Mr. SCHAFFNER. Yes; there is.

Mr. THOMPSON. How has that worked out in practice?

Mr. SCHAFFNER. It has worked out very well indeed. I was just saying a little while ago that the third man of the arbitrators has worked it into a conciliation policy more than it is an arbitration policy, and that has been the form of it, so much so, that since last August I do not think the arbitrators have had any meeting at all. You ought to know, Mr. Thompson.

Mr. THOMPSON. Yes; I know. If the commission please, that is all.

Commissioner COMMONS. Any other questions? If the commissioners have any further questions, Mr. Schaffner, they will be submitted to you in writing.

Mr. SCHAFFNER. Thank you.

Commissioner COMMONS. So that we will proceed with the next witness.

TESTIMONY OF MR. SIDNEY HILLMAN.

Mr. THOMPSON. Will you give your name, your present occupation, and your business relationship with the firm of Hart, Schaffner & Marx and the employees of Hart, Schaffner & Marx?

Mr. HILLMAN. Chief president of the Cloak and Skirt Makers Union in the city of New York. I have been connected with Hart, Schaffner & Marx and the employees of Hart, Schaffner & Marx, representing them, since 1910.

Mr. THOMPSON. In what position do you represent the employees of Hart, Schaffner & Marx?

Mr. HILLMAN. Practically in every position there was; first as business agent, and then as chief deputy.

Mr. THOMPSON. In other words you are the main or chief representative of the employees there?

Mr. HILLMAN. That is what they call me.

Mr. THOMPSON. At Chicago did you work in the clothing shops of Hart, Schaffner & Marx prior to the strike of 1910-11?

Mr. HILLMAN. I believe I worked about two years in Hart, Schaffner & Marx prior to 1910.

Mr. THOMPSON. Then you are acquainted with the conditions that existed in the shops prior to that strike?

Mr. HILLMAN. Yes.

Mr. THOMPSON. When did that strike occur, what was the cause of that strike, and how was it settled? Briefly, if you please.

Mr. HILLMAN. Well, if I may, I would like to give a little of my experience as well, working not for Hart, Schaffner & Marx, in what we call the closed shop and the nonunion shop. I believe the conditions are about the same. I worked for Hart, Schaffner & Marx before the strike and before the settlement of the strike. I also worked for Sears-Roebuck prior to that. I remember working at Sears-Roebuck's shop. We had been working about 8,000 people without a strike, and there were printers working, and it always came to us, comparing conditions, where we were working for the same firm in the same block, and the printers, I believe, worked seven or eight hours a day—I guess eight hours a day, I don't remember—all of them big, healthy, strong men. In our place we were working about 7,000 girls, one place, our place, 10 hours a day, and before the 10-hour law was passed they used to work three nights a week, getting for remuneration a supper that was paid for by the company in their own restaurant. I believe the girls used to work much harder than the men there.

I especially recall the feeling of fear besides the wages. I believe I started in with \$7 a week, and during three years I worked up to \$11 or \$12, but what I consider more important is this, that is the constant fear of the employee of being discharged without cause at all. There really was no cause at all, sometimes. The floor boss, as we called him, did not like a particular girl or a man, and out they went. I remember especially the panic of 1907, when the employees were in constant fear of "Who will be thrown out?"

I remember we tried, all of us, to get into the good graces of the floor boss. When I worked for Hart, Schaffner & Marx I worked, first, two months, and it was understood that I had savings enough to live if I did not get any other remuneration. I believe for about a couple of months I worked for \$6 or \$7 a week. The conditions prevailing were about practically the same, the man directly in charge was the boss and everything else. I remember when I made the first complaint I packed up my tools and I went out.

So these are really the reasons, the main reasons, that led to the strike, the absolute power not only of the foreman—as a matter of fact, in most instances, the working people do not know who is the head of the firm, only the people who are directly just above them—and the lowering of wages. I really don't believe there is any limit at all to the falling down of the wages in a nonunion shop. The strike occurred—

Commissioner WEINSTOCK. You are speaking now of Hart, Schaffner & Marx?

Mr. HILLMAN. Yes; Hart, Schaffner & Marx. The strike occurred—I believe it started some time in October, when five girls walked out—I remember we made fun of it—five girls working against Hart, Schaffner & Marx—but somehow the girls managed to take out the men after a while. There really were no definite demands; the demands were that conditions must be changed; nobody knew really exactly what they wanted; they wanted something better, of course, or different; and the strike kept on about 18 weeks, and it involved the whole city of Chicago, practically over 50,000 men and women; and after numerous conferences, I want to say, from the start, our people thought that the closed shop is the remedy for everything; and I daresay 99 people out of 100 never knew what a closed shop meant.

This was practically the first demand; they did not ask for increased wages or anything, but they asked for the closed shop. After 18 weeks of strike we settled an agreement submitting everything to arbitration, not any particular demands; and the board of arbitration settled all the grievances that there were at that time and also established some method for settling grievances in the future. This was the first agreement agreed to by the firm of Hart, Schaffner & Marx.

Mr. THOMPSON. Mr. Hillman, will you state to the commission how that agreement expanded and grew?

Mr. HILLMAN. I have here the first agreement. Practically all the first agreement states is this:

"All of the former employees of Hart, Schaffner & Marx who are now on strike shall be taken back and shall return to work within 10 days from the date hereof."

The other is with reference to the arbitration committee and reads as follows: "An arbitration committee consisting of three members shall be appointed. Within three days from the date hereof the employees of Hart, Schaffner & Marx who are not on strike shall select one member thereof; Hart, Schaffner & Marx shall select one member thereof within three days thereafter; the two

members thus selected shall immediately proceed to select the third member of such committee."

Practically in the first agreement the organization was not recognized. Hart, Schaffner & Marx signed the agreement with their employees, not through the organization. The employees signed by Rickert, Harris, Robins, Fitzpatrick, and then the firm of Hart, Schaffner & Marx signed. At that time a board of arbitration was appointed. We appointed Mr. Darrow to represent us, and the firm appointed Mr. Carl Meyer to represent them. I believe there was discussion about getting a third man, that discussion lasting about 10 weeks or so; but neither side could suggest nor agree to a man.

After discussion, we agreed that the two men should try to adjust all these matters.

On March 13 the decisions of the board of arbitration on questions between Hart, Schaffner & Marx and their employees were issued. There were some rules issued, which we call the original agreement, by which we are governed. Those rules have given a 10 per cent increase to the tailors and a 5 per cent increase to the cutters.

The most essential part in the agreement, in my judgment, is the last paragraph, reading as follows:

"As to any future grievances the firm of Hart, Schaffner & Marx shall establish some method of handling such grievances through some person or persons in its employ, and any employee, either by himself or by an individual fellow worker, shall have the right to present any grievance at any reasonable time, and such grievance shall be promptly considered by the person or persons appointed by said firm, and in case such grievance shall not be adjusted, the person feeling himself so aggrieved shall have the right to apply to some member of said firm for the adjustment of such grievance, and in case the same shall not then be adjusted, such grievance may be presented to Clarence Darrow and Carl Meyer, who shall be constituted as a permanent board of arbitration to settle any questions that may arise between any of the employees of said firm and said firm for the term of two years from April 1, 1911, during which time these findings shall be in full force."

I consider this the most important part of the agreement, because it provided a method for adjustment, not only of any particular grievances, but of all grievances that may arise hereafter.

In the development of the situation, we found soon enough there were as many grievances in the shop as there were employees. We found grievances had been constantly arising, and especially as this agreement was an open-shop agreement and most of the foremen had started a discrimination, what is usually known as a discrimination in open shops. I remember one shop had about 30 discharges in one week.

According to this agreement, all the people feeling themselves aggrieved or discriminated against had the right to bring up their grievances. When we tried to bring up our grievances there were so many of them that Mr. W. O. Thompson, who was after a while the arbitrator for the employees, and Mr. Meyer, stopped practicing law and went to adjusting our complaints. I remember the board of arbitration used to meet practically every day for a while. What it did lead to is to think of some method whereby the complaints should be adjusted. It is certainly impractical that the arbitrators should go into each small detail.

After a year and a half I believe a trade board, as we called it, was created. The trade board was composed of five men representing employees directly working in the shops, and five foremen. The impartial chairman, or the umpire, as he is called, was Mr. Howard. Then we also created the deputies, who have been deputized by the trade board nominally. As a matter of fact, they are representatives of the employees and the firm, and any grievances that come up are first investigated by the deputies, who try to adjust them, and if they can not adjust them, they bring them up to the trade board.

Commissioner WEINSTOCK. You say the particular trade board consisted of five foremen and five workers?

Mr. HILLMAN. Yes.

Commissioner WEINSTOCK. The foremen represented the house?

Mr. HILLMAN. The foremen represented the house and the workers represented the employees.

This trade board was created so that it was really a new method of adjusting complaints—that is, the new method suggested to us by that plan—and that is an adjustment by the workers themselves. It introduces really what I call

the new principle in our organization, that if the workers are to be disciplined for any violation, they themselves partly should be the judges, agreeing themselves to a certain agreement.

We also found in our place—as Mr. Schaffner explained, there are probably 150 or 160 divisions of labor, and there was constant trouble, it all being piecework.

There was complaint and constant misunderstanding as to the amount of work to be done for the agreed price. In some instances it was 10 cents a hundred garments, so that any additional work affected in a great degree the earnings of the people. We have also agreed that no changes in the work can be made unless agreed to by a price committee, one representing the organization or the employees, and one representing the firm, and any specification, as we call it, for work must be signed by the two representatives before it can go into the factory.

Commissioner WEINSTOCK. If they disagree, then what?

Mr. HILLMAN. If they disagree, it goes to the trade board; but I wish to say they have never disagreed, practically. This is in a matter where I have taken up the work for only about six months, and there were 350 new prices made, all those prices affecting in the earnings paid out as the result of those prices, perhaps millions of dollars. I do not know. To our people it means practically settling their scale of wages. It also was shown that if the firm wanted to put in some work, and the people felt aggrieved, they would complain.

Commissioner WEINSTOCK. Is the work all done by piecework?

Mr. HILLMAN. I would say in the tailor shops I suppose about 98 per cent is done by piecework; maybe 95; I do not know exactly. The new method is that no new work can be put in except in this way. It is not a rule where the people, if they feel aggrieved, can not complain, but nothing can be put into the shop until the workers agree, or until their representatives agree.

I would like to say on this point that there is a certain notion or feeling that may be justified by the experience of most people, that wherever there is arbitration there is no conciliation. I want to say that my experience is just the contrary. As long as we had only two men on the board, as long as we had only one man representing each side, while nominally they were arbitrators, I want to say that as far as fairness is concerned I do not believe any arbitration board was ever created that had more fair men. Mr. Carl Meyer, representing the company, is about one of the fairest men I ever met. Still, that feeling in the minds of the people, and I suppose also in the minds of the company, that whatever was decided was a concession to the other side, simply not to get into trouble, or that we might have gained the case if there would have been an impartial man, made a feeling that directly we had more cases for the arbitration board since we have the impartial chairman. We find it, in the way it works out, that conciliation, in my judgment, is mostly applicable where there is a power of arbitration somewhere. I know that two sides come together, and they know if they do not agree someone will have the power to enforce a ruling. In my judgment and in my experience, there is more opportunity for them to agree.

Commissioner WEINSTOCK. You mean the arbitration acts as sort of a big stick?

Mr. HILLMAN. Just exactly. I know before I left Chicago I do not believe we had a trade board meeting for over six months and not an arbitration board meeting. The trade board and arbitration board is really a possibility for machinery where they can take up, not only the grievances of the workers, that as a rule are presented in the time of strike, but where they can take up everyday complaints in the shop, which, in my judgment, where people work in such shops, are apt to arise to a certain extent. The only way to abolish those complaints is not to go to the board and complain. In a way, if 6,000 or 8,000 people are working together, there is a certain community of interest, but certain conflicts will arise, and what I call the trade corps, consisting of good people, not only hear the merits of the matter, but as the cases arise they lay down some precedent and establish some precedent, which creates an atmosphere where the people feel they are not merely workers in the shop.

Going further, they found that even the trade board was not sufficient to meet all the demands. While it is not in the agreement, we have put what we call the commission form of government in effect. Instead of having a body of ten sitting and arguing cases, we have given that right to deputies from both sides, together with the chairman of the board of arbitration, who go out on cases and investigate them for themselves and then render certain decisions. It is more efficient. It does not take much time.

Commissioner WEINSTOCK. Do you mean that the trade board acts as a sort of appeal court?

Mr. HILLMAN. No. The trade board is supposed to be a court of first instance, and then an appeal may lie to the board of arbitration; but we have established in practice—it is not a part of the agreement yet—that if there are a certain number of cases, instead of having the cases come up and the people come there and argue their cases, the chief deputies, together with the chairman of the arbitration board, will go right to the place in the shop, look over the grievance and render a decision.

Commissioner WEINSTOCK. You mean Mahomet goes to the mountain instead of waiting for the mountain the come to Mahomet?

Mr. HILLMAN. Yes. We believe that a court of arbitration, which necessarily results in delay, is absolutely objectionable, to workers at least. You can not wait for a certain decision to be handed down in three months, when the complaint has perhaps adjusted itself; and if the arbitration is to be effective it must be a speedy arbitration, and we find this to work more satisfactorily even than the one before. That is as far as the agreement has worked out right there.

The CHAIRMAN. Mr. Thompson, have you any further questions?

Mr. THOMPSON. What effect have these trade agreements, in your opinion, had on the position of the employees, briefly stated, with reference to earnings, working conditions, and treatment in the shop?

Mr. HILLMAN. With reference to earnings I have not got all the figures before me, but I know in certain branches, especially in the cutting department, where I was employed before the strike, I believe there was an increase of 50 per cent all through, taking the whole department. I believe it will be nearly that. As far as the workers are concerned, the tailor shop being piecework, it is different in certain things, because, as a matter of fact, the prices are being readjusted practically every other week. In some instances they get more and in some instances less.

Commissioner WEINSTOCK. I want to get one point a little more clearly in my mind. Let me make sure if I understand you. This subcommittee, consisting of two members of the arbitration board and two from each side, do they go in advance, before the matter comes up before the trade board, or after?

Mr. HILLMAN. Before. As far as the conditions are concerned, I believe there is such a change that really it can not be explained. The people really feel themselves a little more like men and women. Before that there was not a feeling like that in any shop, and there is not in any nonunion shop, contrary to any statements that may be made by people who defend the open shop. I do not believe it is possible to have the full feeling of manhood.

Commissioner WEINSTOCK. We were led to believe from what Mr. Schaffner said that you had not a closed shop, that you had a preferential shop.

Mr. HILLMAN. Well, I do not know what you call a closed shop. We have no closed shop. It is a preferential shop. I mean a place where the people have their rights protected in any forum. The forum does not make so much difference. We have a preferential union shop. It is working out satisfactorily.

Mr. THOMPSON. What do you believe has been the effect of the introduction of the committee on immediate action in New York, if you are able to state at this time?

Mr. HILLMAN. It is perhaps a little too early to make any statement, but I do believe—

Mr. THOMPSON. Do you believe it has been the correct thing to do or not?

Mr. HILLMAN. If this is not correct we are sure that the experience of the past was assuredly not correct. I do not know if this will be the remedy. My conviction is that it will, but there is no question, in my opinion, that the protocol could not last without the introduction of an umpire. I do not believe it could last.

Mr. THOMPSON. Tell me how many new prices are made in Hart, Schaffner & Marx factories every week or month, and how many men are needed on the price board?

Mr. HILLMAN. Prof. Howard can perhaps give you figures, but I believe during the season about 500 prices are made, at least, I mean if there are many changes. As a rule the adjusting of prices was done by one man from each side, and these men do not give all of their time to that particular work.

Mr. THOMPSON. You know the arrangement committee which was drawn up. When they do not agree, has not Mr. Williams been called on to bring them together?

Mr. HILLMAN. It was supposed to go to the trade board. It may be there were perhaps four or five cases where there was a deadlock on it, but the minute we came to the trade board we agreed right there without getting their decision.

Mr. THOMPSON. Do you know about how many piece prices are settled in New York, or do you not know?

Mr. HILLMAN. Any agreement made is practically nearly a settlement. The price committees are called every week, once a week, to settle prices.

Mr. THOMPSON. You are not familiar with the number that are settled in New York?

Mr. HILLMAN. I do not believe anybody could state correctly.

Mr. THOMPSON. That is all.

The CHAIRMAN. Any other questions that the commission has will be forwarded to you.

TESTIMONY OF MR. EARL DEAN HOWARD.

Mr. THOMPSON. Prof. Howard, will you state your profession, residence, and connection with the firm of Hart, Schaffner & Marx?

Mr. HOWARD. By trade I am a teacher in the Northwestern University, but for the last three years I have given part of my time to the firm of Hart, Schaffner & Marx as manager of their labor department. I live in Evanston, Ill.

Mr. THOMPSON. Prof. Howard, I understand you have prepared certain information in regard to the working out of the trade agreement at Hart, Schaffner & Marx's. I will ask you if you have that in shape to present to the commission in written form, in order that we may save the time of going into it. I will direct your attention to the question of collective bargaining, conciliation, and arbitration as it works out there, and your opinion in regard thereto. First I will ask you, from your experience do you believe that collective bargaining is the proper way of dealing between a firm and its employees, and why?

Mr. HOWARD. I undoubtedly believe it is. I believe it is the only possible foundation for an experiment such as we have had. That does not necessarily mean, however, that the employees must be represented by a national union or any kind of a union. We have been particularly fortunate in having our own employees in a rather autonomous organization, very little influenced by outside organizations. I think that has been quite a factor in progressing in the experiment, because they were rather free to adopt policies and to harmonize their policies with those of the board of arbitration. But it is necessary in any experiment of this kind where the employees must be represented, or at least their opinions must be known and given expression to, that they have their representatives and they be able to choose in some way, so that they will be properly representative. That implies, I think, some organization, and, of course, the dealing with employees directly in any form whatsoever implies collective bargaining, especially with reference to wages.

Mr. THOMPSON. You believe that either associated with the international union, or just simply as a shop itself, that dealing with the company and people in a collective way leads to peace and to less friction than dealing individually?

Mr. HOWARD. That has been our experience, undoubtedly. Just for instance, when I first came after the strike was over—the big strike of three years ago—there were little strikes, shop strikes, and section strikes, involving from a dozen to 200 men; they were almost a daily occurrence. That was one of our problems. I am led to the belief—information has come to me that it is almost a universal condition of the trade. No one ever dreamed that you could manufacture clothing or any garments without having that condition; and that was extremely wasteful and was detrimental to any kind of efficiency, detrimental to the people themselves; and that was one of the first things we did, to eliminate that if we possibly could, and it took nearly two years to do it. I do not think there has been a shop strike or a section strike of any kind for a year in our shops, except possibly that there have been little misunderstandings of half an hour, but not to exceed that, and just as soon as they understood it they immediately returned to work.

Mr. THOMPSON. In your opinion, Prof. Howard, have these shop strikes been eliminated by the fact of the trade agreement?

Mr. HOWARD. Absolutely. I think it would have been quite impossible, if we did not have the rest of the machinery described in this experiment.

Mr. THOMPSON. What, in your opinion, is the benefit and has been the benefit to the employees coming from this trade agreement? Has it helped them in adjusting their wages and bettering their condition and maintaining their manhood, you might say, in the shops?

Mr. HOWARD. Of course, Mr. Hillman is very much more competent to speak on that subject than myself, although I have come in contact with these employees. I have charge of the so-called welfare department—welfare work—which has to do with rendering assistance to employees who have misfortunes, and my assistants go to their homes very frequently in case of sickness, and they observe them and make a report; and my observation is that the people feel very much more contented and that any grievances they may have will be taken up and any difficulties of any kind will be heard by some one, and they will be given good advice and perhaps material assistance, and they feel that they are members of the body itself and entitled to justice and that they will get justice, and I presume that the feeling which Mr. Hillman describes, that they are really better citizens and that they are better men and women and have a fuller life and means of expression is becoming general, and that they will have an opportunity to express themselves and their opinions and have themselves heard and considered by people whom they respect and have confidence in; I consider that to be a very great factor.

Mr. THOMPSON. Do you feel that the employees can deal as satisfactorily with the firm, individually, with reference to wages and working hours and working conditions as they can collectively?

Mr. HOWARD. I have never had any experience with the individual bargaining. I came simultaneously with, or at the close of the strike, when we began the system of collective bargaining, and, of course, my department immediately established a form of collective bargaining.

Mr. THOMPSON. The cessation of work that occurred, Prof. Howard, in the first year or so of the agreement was, as a matter of fact, a technical violation of the agreement, was it not?

Mr. HOWARD. What cessation do you refer to?

Mr. THOMPSON. In these shop strikes that you referred to, that occurred?

Mr. HOWARD. You mean the fact of stoppage?

Mr. THOMPSON. Yes.

Mr. HOWARD. Certainly, it was a violation of the agreement, technical violation. Of course, I used to go about in the shops whenever there was a strike and make a speech to them and describe the agreement. They were, of course, very ignorant of the meaning. Mr. Hillman used to do so, too, and we really had to instruct all the people that this meant a new way of adjusting grievances. The old way was the only way they knew. For instance, if it was a busy season and the foreman had to get out the stuff, he would give way; but if it wasn't so busy, he would not, and he knew that he could get them back, and he knew that they would take advantage of it if he had to get out the stuff.

Well, we introduced the new system, and it was a process of education; it took a couple of years, but they finally came to understand that it was a violation of the agreement, and they began to respect the agreement, and, of course, a better state of things immediately began, and a better set of conditions, and soon the better element prevailed, and now we think they all understand it and know perfectly well that it is a violation.

Mr. THOMPSON. How many different nationalities have you under your observation?

Mr. HOWARD. I don't know, really. As Mr. Schaffner said, the largest single nationality is the Russian Jew, then the Poles and Bohemians, and the next are Italians. Then we have a few Scandinavians and Slavish people, and even a Greek, and a Persian came in the other day looking for occupation. We have no Chinamen, or anything of that kind.

Mr. THOMPSON. There has been something said while you have been here attending the sessions regarding the question of conciliation and arbitration. From your experience with the firm of Hart, Schaffner & Marx, what have you to say on that subject?

Mr. HOWARD. This is the way I have always looked at this matter, and perhaps it will throw light on this question: In any kind of society, government must be established. A large concern and its employees is really a little so-

ciety, and the interests of both are so bound up in that industry, that business, such a large percentage of all their interests, that it is really a small society, and it must have a government.

Now, every government, as we have found, must have a constitution, and it not only must have a constitution, but it must have legislation, to deal with new conditions, and it must have courts to interpret the constitution and the statutes.

Furthermore, as we are all familiar with the growth of our common law, legislation is very clumsy and inadequate, and there must be some method by which there can be an organic growth of law, such as our common law. This grows up through precedent established by various bodies and by people who have an opportunity to lay down policies. These precedents become law. At first, when you have a condition of no government, or despotism, and you are trying to change over to a republican form of government, which this is, you must have all these things worked out, you must have the constitution worked out, and you must have the fundamental law laid down, and you must have interpretations of it and legislation. This little booklet shows that development very clearly. We regard this agreement as our constitution. And then we have to have decisions. At first everything came up with us, all sorts of questions. Mr. Hillman and I would try to settle them ourselves. Of course, we could not, in a good many cases, and we by mutual agreement would say, "Let us have this thing settled; let us have this precedent established; let us have laws and legislation," and we would refer it to a board of arbitration, and the board of arbitration gradually guided us, and has gradually enacted what expresses to a large number the ideas of the principles of justice in this industry, and since we have had this we have been able to settle practically all grievances.

Mr. Hillman realizes this as well as I do. And we take a great deal of satisfaction in the fact that we worked it out together and seeing how much efficiency we had established, and, although there were differences, we would follow them, no matter where they led, and seeing that our decisions were carried out, so that it gradually came about that we accumulated a great deal of law; and that is the explanation now why we do not have to go to the board of arbitration except rarely, and we have been to the trade board very rarely. It never sits now, I think, on any question where there is a principle at stake that has been once decided, and I foresee the time when the sittings of these boards will be a very rare occurrence, indeed.

Mr. THOMPSON. What do you think of the utility of the umpire as part of the machinery?

Mr. HOWARD. In our government of this country there must be some authority to settle questions at issue. Of course, one of our great questions had to be settled by a civil war. I do not think we would like to settle all of our questions in this country by a civil war, but in the courts, although there is a great deal of criticism of their decisions, they have an analogy to the laws in our industry.

Mr. THOMPSON. Then, you think a third man is necessary?

Mr. HOWARD. At first; and he ought gradually to work himself out of a job, as you have done, Mr. Thompson.

Mr. COHEN. And into another.

Mr. BARNETT. You stated at the beginning of your testimony that the organization of the employees in Hart, Schaffner & Marx was autonomous—these employees organized in local unions of the United Garment Workers.

Mr. HOWARD. Yes.

Mr. BARNETT. Are these local unions practically composed exclusively of employees of Hart, Schaffner & Marx, or are there other employees of other firms included in their membership?

Mr. HOWARD. Not exclusively. Simply because there is not enough people employed by other firms to organize a local they take them in, but they have very little, because there is a little problem now developing on that account; but the principle to decide, after all, is so small that it does not make much difference, and I think that it will gradually work out that the unions will consist only of Hart, Schaffner & Marx employees. I hope to see it that way. Of course, I can not determine their policy.

Mr. BARNETT. How many kinds of garment workers?

Mr. HOWARD. We deal with these local unions, but they are really working down to a smaller number. You see there are three divisions of the work—the trousers, vest, and coat makers have a local and the pants makers have a

local; they are gradually merging into the cloak makers; they have a very close identity with their interests and are somewhat in cooperation with the vest makers' local.

Mr. BARNETT. What we want to get at is about other pants makers in the city of Chicago. Are they organized in a local—local unions—or are the employees of Hart, Schaffner & Marx the only union garment workers in Chicago?

Mr. HOWARD. I think that is almost true; but Mr. Hillman could tell you much better than I could about that.

Mr. BARNETT. Is there only one union of pants makers in Chicago, composed of about four-fifths of them?

Mr. HOWARD. I would not say that. Mr. Hillman—you had better ask him that question.

Mr. HILLMAN. They have one local union outside of Hart, Schaffner & Marx pants makers.

Commissioner COMMONS. Prof. Howard, if you have any statistical information that you think would assist us, we would be very glad to have it.

Commissioner LENNON. Did we not understand that he had a brief already prepared that was to be submitted to the commission?

Mr. THOMPSON. No; I understand he collected data and information about the working out of this proposition. I thought we would go into that, but on account of the need for speed I thought we would eliminate those questions.

Mr. Schaffner, would you mind taking the stand again? I would like to ask you a few questions.

TESTIMONY OF MR. JOSEPH SCHAFFNER—Recalled.

Mr. THOMPSON. To what extent was the willingness of the firm of Hart, Schaffner & Marx employees to accept this membership agreement, due to the fact that any concession by an employer was an improvement over the previous condition?

Mr. SCHAFFNER. I do not know as I exactly understand that.

Mr. THOMPSON. Well, was the getting of the original agreement from the firm, which, of course, was made solely with the employees of the firm, and providing for no closed shop—was that an improvement over the condition prior to the strike?

Mr. SCHAFFNER. Anything was an improvement over that.

Mr. THOMPSON. Has the firm of Hart, Schaffner & Marx had uniformly satisfactory experience with the labor unions?

Mr. SCHAFFNER. Well, I said in my statement that we had had very unfortunate experiences with the cutters' union, to the extent that they tried to restrict the output and hamper us in almost every other way.

Mr. THOMPSON. Have those restrictions been removed? Is the firm working now with the cutters?

Mr. SCHAFFNER. There seems to be perfect harmony, so far as I can see. I do not come into immediate contact with them, but we are working along with them all right.

Mr. THOMPSON. Does the cutters' question come into this?

Mr. SCHAFFNER. It is all the same thing.

Mr. THOMPSON. Anything first has to be passed by the trade board, or the board of arbitration?

Mr. SCHAFFNER. I think these demands are very few now, and we do not have very much arbitration, and very little conciliation.

Mr. THOMPSON. What protection can an employer reasonably ask against unreasonable demands of a labor union?

Mr. SCHAFFNER. I really do not know. That is a puzzle; I do not know what he can ask. If he has an arbitration arrangement, he can ask from them, as he can from any of his other employees, because they are all bound by the same conditions, I should say—the same laws.

Mr. THOMPSON. But in the absence of the board of arbitration, or of any agreement, it is simply a test of strength?

Mr. SCHAFFNER. Of course, it is a test of strength; it generally leads to strife and strikes, and hostility of all kinds.

Mr. THOMPSON. Granting, or assuming for the sake of argument, that some employers are unreasonable, and exhibit greed, and so forth, is the same true in respect to some of the unions?

Mr. SCHAFFNER. Well, I might say that I am not so well posted about unions that I can answer that. I really do not know much about them. I can not

criticize them, because our relations with them, or dealings with them, have been confined to just these instances that I have criticized. I should say that generally they make an effort to be reconciled to their employees, whether they belong to a union or do not belong to a union.

Mr. THOMPSON. If you had the opportunity, Mr. Schaffner, would you go back to the old way of dealing with employees?

Mr. SCHAFFNER. No; not in a thousand years. If we did not have an agreement with an organization such as we now have, I would certainly insist upon having our employees represented so that they would have an organization among themselves that would dispense the same kind of justice as we have now dispensed by the arbitration board and the trade board. I think the conditions such as we had before, while we got along for many years, and got along very well—in fact, just a few days before the strike one of my friends came in and congratulated me on the fine business that we had and the achievement we had made, and I told him I was very proud of it, but I was prouder still of the happy and contented condition of our employees. That was just two days before the strike. I thought they were just as happy as they are now. I did not know any different.

Mr. THOMPSON. You now know that they have an outlet?

Mr. SCHAFFNER. I know now they have a chance to maintain their self-respect. Commissioner WEINSTOCK. The present system is sort of a safety valve?

Mr. SCHAFFNER. Yes.

Mr. THOMPSON. Is it reasonable or desirable that there should be some responsibility or publicity of methods on the part of the union similar in some respects to the duties, obligations, and responsibilities of employers?

Mr. SCHAFFNER. I think the union should make the same effort to meet the emergencies that the employer makes. I do not know whether I am answering you as you desire.

Mr. THOMPSON. What is wanted, Mr. Schaffner, is this: Do you believe there should be some responsibility fixed upon the union by the general publicity methods such as now are fixed on corporations with reference to their actions, in order to control their actions and not have them go to extremes?

Mr. SCHAFFNER. I have not really thought that out. I could not answer that.

Mr. THOMPSON. That is all, Mr. Schaffner; thank you very much.

Mr. Chairman, I desire to say this to the commission, in regard to the New York situation, which I am about to take up, that there has been prepared by the Bureau of Labor a bulletin of the cloak protocol; also I understand there is on the press of the Bureau of Labor now a further bulletin with reference to the clothing situation in New York. The tabulated forms of matter that has been prepared by the Bureau of Labor I have here, one relating to men's clothing industry and the other to ladies' garments. In addition to that, this commission has taken about 500 pages of testimony in New York City relating to the garment industries, and it is our intention at the present time to give a further hearing to that industry in New York City. Therefore, in calling further witnesses now, I will try to confine their questions now to the matter of collective bargaining, conciliation, and arbitration.

The ACTING CHAIRMAN. Mr. Thompson, I should like to suggest that, following the program you have laid out with all these witnesses, the commission would like to have them remain and ask any questions that may occur up to the time of the recess at 1 o'clock.

Mr. THOMPSON. Very well, Mr. Chairman.

Will you please take the stand, Mr. Cohen?

TESTIMONY OF MR. JULIUS HENRY COHEN.

Mr. THOMPSON. Will you please state your name, profession, and your connection with the cloak-makers' protocol and the shirt-waist protocol in New York City, and any other protocol with which you may have had connection.

Mr. COHEN. My name is Julius Henry Cohen; profession, lawyer; counsel for the Cloak, Suit, and Skirt Manufacturers Protective Association; the Dress and Waist Manufacturers' Protective Association; in 1911, the Merchant Society of Ladies' Tailors and Dress Makers; in 1910, clothing contractors and clothing manufacturers.

My relations with the protocol or method of collective bargaining in New York City has been with the so-called cloak protocol, the dress and waist protocol, and the agreement which could hardly be called a protocol, between

Local No. 38, International Ladies' Garment Workers' Union, and the Merchants' Society of Ladies' Tailors and Dressmakers.

Mr. THOMPSON. Mr. Cohen, from your experience as counsel in these matters, have you formed any opinion as to the value of trade agreements in the relation between employers and employees?

Mr. COHEN. I have.

Mr. THOMPSON. Do you believe such agreements are of advantage to both the parties or to either of the parties?

Mr. COHEN. It depends upon the form of agreements, and the people who are going to execute them.

Mr. THOMPSON. Take the protocols which are in existence in New York City to-day; take the cloak protocol, for instance, of which this commission have a copy. In your opinion has that been a useful and beneficial document?

Mr. COHEN. On the whole it has been.

Mr. THOMPSON. What are the reasons that lead you to that opinion with reference to its benefits, first to the employers, and next to the employees?

Mr. COHEN. If I may state my opinion on the general subject of collective bargaining, I can refer in detail to our experience in the cloak, and the dress and waist, and the ladies' tailoring situations.

Mr. THOMPSON. Yes; you may.

Mr. COHEN. Prof. Howard took out of my mouth the words that I was going to use. If you are going to substitute for force a method of reasoning for determining controversies between working people and employers, you have to create a legal method. I mean by "legal," a method that is law for the people who are concerned. Your collective agreement, if it is to be a permanent feature of industry, is in the nature of a constitution of the industry, and just like any constitution of a political form of government which can not exist unless there are means for legislation and means for making decisions and means for creating new institutions as the occasion arises; and, just like the constitution of a political form of government, it works or does not work, according to the people who live under it. An American constitution in Mexico does not work. The highest kind of collective agreement, in my judgment, would be good for nothing in an industry where the employers were either selfish or unscrupulous or trying to take advantage of collective agreement on the whole, or where the working people were in their nature anarchistic in their tendencies and not law-abiding. It seems to me it is a case of efficiency in working machinery, and in the character and temperament of the men who operate the machinery; and so far as the principle of it is concerned, there can be no more question about the validity of the principle of collective bargaining in industry than there can be about the principle of constitutional government in a democracy. The fact is, the working people have just as much right to have their grievances heard, and heard collectively, as the great mass of people have the right to vote at the polls upon the matters that affect them, and we are coming to recognize that fact in industry, just as we long ago recognized it in politics.

All the protocol does is to create the machinery for working out in the industry, involving over 100,000 people, the problems very analagous to the problems we have in political life; and just as we succeed or fail according to the men we put in office, so it has been my experience that we succeed or fail in the industries according to the men we put in office, because, as Mr. Schaffner said in his testimony, it is not so much the letter of the agreement as it is the spirit, and the spirit is expressed by the human individuals in charge.

I found a complete failure of the collective agreement in the ladies' tailoring industry, and the explanation for it is very simple. The people in Local No. 38, as was demonstrated before the board of arbitration, did not care for a collective agreement. They preferred to have the warfare continued; shops strike whenever they felt like it; and the reason for it was because there were so few good ladies' tailors that they had the balance of power in their hands, and the making of a collective agreement balanced the power equally between the employer and the employed.

And let me say, by way of passing, that any kind of institution that gives one of the two parties a balance of power can not last. The power must be balanced equally between the two, and if it is not balanced equally between the two by the institution, it is bound to break down; the agreement is bound to break down.

We have had failure and we have had success in the dress and waist industry and in the cloak industry. We have had success wherever the spirit that Mr. Schaffner referred to prevails, where we have had the men on both sides

who were willing to sit down and apply the test of reason to the facts. When that was done the institution would work, and when it was not done it would not work. The great value of the protocol, in my judgment, is that even where you have men in the situation who do not carry out the spirit you still have a safety valve, and in that connection, in passing, may I say that I do not at all agree with the testimony or conclusions of Mr. Frey yesterday, because in the very situation in New York recently, where there was perhaps as serious a crisis as has existed in four years, the existence of the board of arbitration and of this commission made possible the adjustment of that difficulty, because Mr. Frey overlooks the fact that the opportunity to present a situation in the open, where it can be discussed upon the merits, makes for the final ascertainment of the truth, and the truth is the thing which must prevail in the long run whether it is a process of conciliation or arbitration. And what every situation needs is a place where a record can be made by both parties, where in the open they can meet each others' contention, and that clears the atmosphere and makes for the possibility of peaceful solution, just as in government, under a political constitution, the legislature and the courts are the safety valves for the people, and when they break down then your whole situation breaks down.

Now, I want also, if I may, Mr. Thompson, to supplement what Prof. Howard said. The moment you get your constitution and substitute a method of peace for methods of war you have got to have two forms of a government under that constitution. You have got to have an institution for legislation and you have got to have an institution for interpretation, the making of what is called common law, the making of precedents, because it is the precedents and the code thus established that makes the government of the industry. In order to have those methods of legislation the so-called conciliation method or conferential method is undoubtedly the best. In the cloak industry and in the dress and waist industry the grievance board, as you know, is the permanent legislative tribunal, and if the board deadlocks it goes to the board of arbitration. As you know, recently the protocol was amended by increasing the rate of pay for cutters by the board of arbitration to such an extent that it increased the payment to pressers by about \$300,000 a year in the industry, and that was done peaceably, without any strike, after careful investigation statistically by the department of statistics, of which your Mr. Manly was one of the heads, under the supervision of the board of arbitration, one of whom was Dr. Walter Weyl, a trained economist.

In addition to the legislative process you must have the process of deciding cases. You can not entirely take the system of deciding cases that you have developed in our Anglo-Saxon jurisprudence, because the method of examining witnesses and arguing in court is too complex for the daily activities of industrial life.

That results in the creation of the system of clerks and deputy clerks that you have for a large industry that has been described of record here, and as it was described in New York, where the people go to the factory and adjust their disputes.

You will have presently from the Department of Labor statistics of intensive study of the operations of the protocol in both industries made by Mr. Winslow of that department. It is now in the printer's hands. If my memory is correct, of the 7,556 grievances in the cloak industry since March, 1911, all but 123 were disposed of by the clerks or deputy clerks, and of those 123 all were disposed of by the board of grievances except 8, and those 8 involved questions of interpretation of the protocol, questions, as we call them now, of protocol law that could only be disposed of by a tribunal having the power of ultimate decision. And that tribunal in the cloak industry and in the dress and waist industry is the board of arbitration.

The board of arbitration is made up of people who are not in the industry—Mr. Brandeis; Hamilton Holt, the editor of the Independent; and Walter Weyl, a lawyer and editor and an economist.

The process of determining questions, both legislative and law, in a general sense is exactly the same. The process is that process which the lawyers of the world have been trying to carry out into procedure for centuries, namely, to get at principles and to get at facts and apply the principles to the facts. So that the whole thing is a method of getting at the facts and finding out what principles should govern, and the principles can only be ascertained by discussion. And my criticism of Mr. Frey's argument yesterday is that the

confidential method will not always get at the facts or get at the right principles. In the first place, although the man on the job knows more about the technique of the job, he does not always know as much about the general principles as a lawyer or an economist or a doctor who is called in from the outside. As a matter of fact, the protocol itself was made possible by an outsider. The invention of the preferential union shop by a lawyer in that situation resulted in the protocol. The very institutions that now make for peace in the industry are the inventions of lawyers—the board of sanitary control, the board of grievances, the clerks, the method of making precedents. This last thing, the committee on immediate action, is the joint invention of two lawyers.

All of these institutions have been created by lawyers from the outside or economists from the outside, brought into the situation. And it is because the lawyer is trained to find facts and to find principles that he has a valuable contribution to make to this problem, and because the method employed for centuries of getting at facts is the right method, that the analogies have worked out under the protocol, because, after all, the board of arbitration is a tribunal for getting at facts, listening to argument upon the facts, and making decisions upon the facts.

Mr. THOMPSON. In your opinion, is the introduction of the umpire on the board of arbitration, as you have it, a good thing?

Mr. COHEN. I do not call him an umpire, for a very important reason. The committee on immediate action is made up of three people, and those three people make the decision. Hence one of the difficulties of the problem, as I see it, is this, that under the machinery developed through the machinery of the protocol the man who represents the union and the man who represents the employers' association is not only an advocate, but he is a judge as well, and he has to be of that unique type, like the Howards and the Hillmans; and that is why we have to go to Chicago for our men for New York. He has to be of the unique type that can be both advocate and judge at the same time.

The committee on immediate action is a judicial body, and the clerks do not sit on that judicial body, each fighting for something in favor of his side, but with the aid of the third man, who is impartial, they come to a unanimous decision, and have come to unanimous decisions in every case. Under the old system the two clerks did constitute a committee on immediate action, and in all but very few cases where it involves questions of interpretation or legislation they did come together.

I do not agree with Mr. Hillman that the committee on immediate action was necessary to save the protocol. I do agree that it was a desirable improvement, because it takes off the shoulders of the people who sit on that grievance board the tremendous strain that was put upon them; and as a committee that decides questions of fact but not of protocol law it is a very distinct improvement upon the machinery. I would have the same feeling with regard to the umpire that Mr. Hillman has with regard to the umpire. If you are going to put upon the shoulders of a single man the decision of great questions that affect an entire industry it breaks down, because, in the long run, the very great mass of working people or very great number of employers would not be satisfied to leave the destiny of their interests to the decision of a single man. In our board of arbitration we have no umpire. We have three arbitrators, and, although one is named by each side and the third man is named by both, the three regard themselves as representatives of the public, with no interest to serve, except the interest of finding a sound decision in the particular case. And one of the curious things is that every decision by the board of arbitration has been a unanimous decision. The battle in the councils of the board has always been a battle not of fighting each side for what it contends from the third umpire but a battle to find out what the truth is and what is the best decision to make under the circumstances. I do not believe at all in any system of umpires; I think it can not last; but I do believe in the creation of tribunals of more than one man who make a steady study of the industry. That is the value of our present board of arbitration under the protocol; that for four years these men have sat with us and know the peculiar problems of the industry, and when we come to take up a particular situation they take it up in the light of their knowledge of the general psychology and economics of the industry. Bringing in people strange to the industry to decide matters would be a danger, just as Mr. Frey pointed out that it would be in the foundry.

Mr. THOMPSON. Mr. Cohen, I will ask you whether, in your opinion, the board of arbitration which you have under the cloak protocol and the committee on immediate action which exists under an amendment to the protocol for taking up grievances arising in the industry and settling them right away would be better if they had even numbers instead of odd numbers of men?

Mr. COHEN. I do not think so.

Mr. THOMPSON. You think an odd number preferable?

Mr. COHEN. Yes; because, as Mr. Hillman said, the fact that the gentleman knows that ultimately one man may determine is an incentive for them to get together, and they get together.

Mr. THOMPSON. Then, if the umpire is simply that man who would have that power which the parties know he has in this case, you have no objection to the umpire?

Mr. COHEN. No.

Mr. THOMPSON. That is all. I thank you.

Mr. COHEN. There are one or two things I should like to add, if I may, that I made some notes of.

In the first place, I want to state that the condition that Mr. Howard referred to as existing in the clothing industry by the trade agreement is analagous to the condition that existed in the New York women's wear industry is prior to 1910, strikes in the shops on every provocation; and at the height of the season strikes successful because the foreman or the boss had to give in, and then retaliation in the slack season.

I also want to refer to the fact that there are very serious problems in the industry; the problem arising out of seasonal employment; the problems arising out of the fact that prices for labor are not fixed by any standards at the present time; piece price methods of adjusting the price of labor on each garment. Over 80 per cent of the wages are not fixed in accordance to any standard. In other words, there is no collective bargaining upon those things.

But I do not believe that problem could be solved by a general strike. I believe the only possibility of solving that problem is through the protocol, by study and conference, and ultimately by legislation in methods that are provided. I think that as Mr. Schaffner has just said, I am personally much concerned, it becomes very clear to everybody that the successful result of this development has depended much less upon the formal or external features than the spirit with which it has been worked out. My conviction is identical with that of Mr. Schaffner, that they are readily moldable if you have the right spirit on both sides, and if you have not that spirit on both sides the thing breaks down. If there is an antiunion spirit, an antiorganization spirit, the thing breaks down. And when the protocol has worked successfully it has been when that mutual spirit is dominant, and where it has not worked successfully it has been when that mutual spirit is not dominant. It has been where one side or the other has not shown that spirit. In that Local No. 38 situation, the Merchant Society of Ladies' Tailors, everything went completely to smash because there was not that spirit of mutual respect and confidence and mutual respect for the obligations that both parties had assumed. It does not mean that where you have mutual confidence the thing works perfectly; we have some strikes in the cloak industry to-day, and we have officials of the union who violate the law, subordinate officials; we have employers who violate the law, just as in political societies you have lawbreakers, but you have the machinery for bringing those people to book and correct any mistakes that they make, and that is the value in the system of collective bargaining. It substitutes a constitution for chaos, it substitutes law for disorder, and it substitutes reason for force; it makes both sides learn to respect each other, learn to understand the protocol, and it makes them feel a mutual respect for the solution of problems, and sometimes ultimately for their solution.

TESTIMONY OF MR. A. BISNO.

Mr. THOMPSON. Mr. Bisno, will you state your name and your connection with the New York protocol in the cloak industry?

Mr. BISNO. 2926 West Twelfth Street, Chicago, Ill.

Mr. THOMPSON. I will direct your attention—

Commissioner COMMONS. Mr. Thompson, he has not yet stated his connection with the protocol.

Mr. BISNO. I am chairman of the educational committee of the Cloak Makers' Union of New York.

Commissioner COMMONS. You are now?

Mr. BISNO. Yes.

Mr. THOMPSON. What position have you had with the union other than that in the past?

Mr. BISNO. I have been its general manager.

Mr. THOMPSON. Under the protocol?

Mr. BISNO. Under the protocol.

Commissioner COMMONS. Who is the person at present occupying that position?

Mr. BISNO. Mr. Hillman.

Commissioner COMMONS. That is the place Mr. Hillman now has?

Mr. BISNO. Yes.

Mr. THOMPSON. And Mr. Horwitz lately occupied?

Mr. BISNO. I preceded Horwitz.

Mr. THOMPSON. And Mr. Hillman succeeded Horwitz?

Mr. BISNO. Mr. Hillman succeeded Mr. Horwitz.

Mr. THOMPSON. From your experience with the protocol will you state what effect it had in regard to the relations of the employers and employees in the cloak industry.

Mr. BISNO. What effect it had?

Mr. THOMPSON. Yes. Has it benefited the employees in their working hours, in their wages, and in their conditions of work?

Mr. BISNO. I believe it has had a good effect. In the first place in the history of the industry it has attained for the first time, partially at least, the benefit of a strike. Previous to this agreement, the protocol of 1910, we used to have a great many strikes, both shop strikes and general strikes, including the entire industry, and whatever we have succeeded in winning during these strikes has petered out subsequently. It is a seasonal trade. During slack seasons the people do not attend to the unions and the unions become weaker. There are a great many employers in the industry, and there was a good deal of competition between shop and shop, and a so-called victory has petered out after the victory.

So that it did not take very long after a victory to lose all we had gained during each strike, and this protocol was an instance for the first time in the history of the industry that I know of. I know it is a little over 30 years where the benefit was retained for a period of over three years, very nearly four; so that I believe very much in the sense of this protocol agreement.

Mr. THOMPSON. If you know definitely, or as definitely as you do know, will you state what effect it has had on the adjustment of wages and maintaining wages, and on the maintaining of the dignity of the worker in the shop, and as to improving his condition in the shop, not only with reference to individual standing, but with reference to sanitary conditions.

Mr. BISNO. The main improvement of the conditions was gotten by a strike, and this agreement retains those improvements. There has been a reduction of hours to 50 hours per week. They used to work 60, and more, before the strike. There was practically no limit in the smaller shops on the hours of labor; they worked all the time, and when they were busy they worked more than unlimited time. This agreement has established a regular working day of 50 hours a week, with provisions during the busy season for some hours overtime. So in this there was great benefit. Then there was an institution established to provide for maintaining sanitary conditions in the shops, which helps materially and improves the sanitary aspect of the industry, better shops. There were some rules as to where a man may keep a shop and where he may not, and where the standard is not perfect, it is a fair standard, much better than no standard at all, as we had before.

On the subject of wages, about 20 per cent of the people employed are week workers, and the standard has been established for cutters and pressers and skirt finishers and some others, I think, and that standard has been maintained. In fact, in the case of the pressers the arbitration board raised that standard last year, \$2.50 for a presser, \$1.50 for an under presser, and \$1 for a helper.

The pieceworkers have not been able to keep up the standard that they have achieved during a strike. If I might be permitted, I will explain the reason why. So that I think that we are deteriorating, going down in the price of labor amongst pieceworkers under the agreement, because there is no equitable method established or maintained as to price for piecework.

Mr. THOMPSON. Is that not due to the fact that you have not got more protocol rather than less protocol?

Mr. BISNO. If you want to word it that way.

Mr. THOMPSON. I will ask you if you know what was the method of dealing with labor in the cloak industry in New York prior to the strike and the creating of the protocol. Do you know what the method was?

Mr. BISNO. Yes.

Mr. THOMPSON. Do they have such things as contractors, inside shops, and subcontractors, and if so, what has been the effect of the protocol on those institutions?

Mr. BISNO. I can not help but always think of the strike instead of the protocol. The change has been brought about not by any protocol, but by a strike; the protocol has been the system by which you would keep what you got.

Mr. THOMPSON. Has it been a good cup or bucket?

Mr. BISNO. The strike has abolished the outside finisher, which was quite a bad feature in the industry. Women used to take work home and do the work at home, and that was insanitary and contained within itself the probabilities or chances of the distributing of contagious diseases among the families of the poor people. The strike has abolished that—made it impossible—at least, the agreement abolished the outside finisher, the home shop.

Mr. THOMPSON. I would like you to make it clear. I think there are two impressions abroad among the commission and the audience as to your attitude on the strike and the protocol. As I understand you, you say in the beginning, in the past when the people got any benefits as a result of a strike, they were lost, gradually frittered away, and passed away, but, as the result of this protocol that now exists, the benefits derived from the strike of 1910 have been kept and maintained.

Mr. BISNO. Very largely.

Mr. THOMPSON. Now you may go ahead.

Mr. BISNO. When you speak of the benefits of the protocol, which I believe in as much as you, the implication is that the protocol is the strength of the thing—the heart and soul of the thing. To us it is the strike, and the protocol is simply a record of the arrangements and agreements which we have made or what is what. The strike has abolished—or the protocol, if you prefer—the home shop, abolished the inside contractor. Manufacturers used to give a man several machines and tell him, "Now, you have in the shop several machines. We will give you so much per piece, and you can hire your own labor and make that." The same was true in regard to finishers and pressers. One man would get an entire job of pressing, and then he used to contract in the shop and employ people, some by contract, some by piece, as he saw fit, and make the benefit of the difference between what the manufacturer paid and what he could get people to do the work for. That the strike has abolished, or the agreement, so that there is no inside shop contracting. It established a regular working day and raised the wages considerably for the contract worker, and also for the pieceworker, and it has maintained them since for contract workers, and has partially lost them for pieceworkers.

Mr. THOMPSON. Does the protocol, as it now exists in New York, and as it existed in the past, help in the question of seasonal work, the regularity of employment?

Mr. BISNO. No.

Mr. THOMPSON. So far as you know, has the protocol been lived up to by the parties?

Mr. BISNO. Yes; largely so, where they could not evade it successfully.

Mr. THOMPSON. What has been the effect of the machinery in the adjustment of difficulties under the protocol?

Mr. BISNO. As has been said before, the protocol has created a board of arbitration and passed upon differences between the unions and the manufacturers. It has created a board of business agents composed of men of the manufacturers' association and the union. These business agents take up the grievances that come up and pass on them. They are called clerks, and if they disagreed, then it came before the grievance committee to pass upon that disagreement, and if that grievance committee disagreed, then it was supposed to go to the arbitration board. As a matter of fact, for the last three years previous to the introduction of this impartial party in the immediate action committee this thing did not work. The union and the manufacturers had disagreed on almost every vital point, and the disagreement always meant that the union lost, because it has been the union that has been making demands for the enforcement of the provisions of the agreement, and if the boss says that he would not continue to have it enforced in the way the union thought it ought to be enforced,

and there was nobody to answer, it simply meant that the union had lost in this disagreement; the union did not get it.

Mr. THOMPSON. In your opinion, then, this immediate action committee has helped to carry out the protocol?

Mr. BISNO. Yes; I agree with Mr. Hillman that that has helped in maintaining the protocol; that it could not have lived unless this thing was introduced.

Mr. THOMPSON. What do you know of the comparative condition of the protocol shops, the nonunion shops and the union shops in New York, the union shops outside the protocol?

Mr. BISNO. There are not any nonunion shops, or so very few that they are insignificant; there are some of them, a little outside of New York, in New Jersey, where they are taking work from New York and making it over there.

There are two associations in New York; one is called the protocol, and then there was an agreement or understanding with another manufacturers' association—smaller manufacturers—with a large number of members in it, about the same number as the larger association; the union has an agreement with employers, not members of either of these associations. The conditions really depend on more things than on the protocol. For instance, the size of the factories, the respectability or decency of the employer himself, and the kind of people he is working. On the whole it is about the same thing. If the condition in the protocol shops becomes worse then the conditions in outside shops become worse, and if the conditions in the outside shops become worse then the conditions in the protocol shops become worse. It all depends on the strength of the union to enforce the whole business.

Mr. THOMPSON. Then there are other union shops; there are other contracts that the union has with the cloak manufacturers in New York outside of the protocol?

Mr. BISNO. Yes; we have agreements with every independent employer besides members of the manufacturers' association.

Mr. THOMPSON. So that there are many agreements in the cloak industry in New York City?

Mr. BISNO. Yes; there is one with the Manufacturers' Protective Society, and with the Manufacturers' United Society, and there are other agreements—there are over a thousand agreements with individual employers.

Mr. THOMPSON. In your opinion do these agreements, so far as you know of conditions in New York, work for the benefit of the men in the shops?

Mr. BISNO. Yes; very much so.

Mr. THOMPSON. Does the existence of the protocol and these agreements tend to reduce the strikes in the industry?

Mr. BISNO. Yes.

Mr. THOMPSON. If you know, is the so-called protocol in New York looked upon favorably by all the workers?

Mr. BISNO. Yes.

Mr. THOMPSON. It is?

Mr. BISNO. Yes; in fact I do not know of a single dissenting voice on that proposition. I have been mostly with the most rebellious crowd in the movement, and even the most inflamed minds are in favor of the improvement of the protocol, giving better expression to their needs; and I have not heard at any meeting or any private conversation amongst the men an assault on the idea of the agreement; it was always an assault on the failure by the officers of the association to fully uphold the agreement, and also suggestions to improve the terms of the agreement, but not on the nature of this agreement.

Mr. THOMPSON. Something has been said with reference to the method, the theory of conciliation and arbitration. Some have favored the idea of equal representation of both the employers and the men on boards of conciliation and arbitration. Others have spoken in favor of the idea of a third party, sometimes called an umpire on such boards. From your experience as an officer and member of the union what form do you favor, and why?

Mr. BISNO. I believe in the umpire. My experience is that where there is no umpire the boss gets the benefit; the boss has had the advantage, because it practically means where there is no umpire that the boss has had his way. When they say conciliation, mediation, and so forth, he has got plenty of time to talk, and so that is all you get. If you have no power to enforce what you want, and have agreed not to strike to enforce it, you get talk. There is plenty of time, so you have got to have somebody to delegate that power and to enforce that, and this umpire in my experience has been the only party who can enforce that.

Mr. THOMPSON. In regard to matters arising with the individual working in the shops, the grievance is generally his; he has either lost his work, or some other manner of discipline is applied to him which he complains of, and in case they are unable to reach an agreement by the conciliation board then he suffers and the employer does not?

Mr. BISNO. That is the idea.

Mr. THOMPSON. What do you know of the condition in New York with reference to such questions—that is, in regard to introducing this immediate-action committee with a third party on it?

Mr. BISNO. When I took office a little while ago I found there was quite a complaint on the part of the men that the active members of the union were discriminated against in the shops, that if a man tried to enforce or helped to enforce the provisions of the agreement the employer either discriminated against him by way of giving him less work, or poorer work, or he discharged him, and that when his case came up before these clerks there was usually a disagreement; the clerk of the manufacturers' society held that this man was not discriminated against, or that the discrimination was warranted because of his conduct, or that he was discharged because he deserved to be discharged. The clerk of the union always held that it was discrimination because of union activity, or protocol activity, or activity to enforce the provisions of the agreement, and there was a good deal of unrest and dissatisfaction among the men. I have had large numbers of men that had no work because of their conscientiousness and sense of loyalty to the union. When I took the position of clerk I knew that there was this dissatisfaction and I tried—I submitted to the manufacturers' association the idea that we introduce an impartial party to adjudicate this, and they have not agreed with me on that, and so during my régime, too, there were numbers of men that were discharged evidently because of their activity in union matters in the enforcement of the provisions of the agreement, and they had no redress. When I brought these cases to the grievance committee we have usually disagreed, so that for the entire period I was there on the vital questions we disagreed on them always.

I have been told by men on the grievance committee previous to my coming there that on these vital questions they had disagreed for months and months, they used to get together and sit there and talk and talk and talk, and the men remained outside; so that it was quite an issue, amongst our people, of dissatisfaction, and this introduction of an impartial party in the immediate-action committee, in my opinion, relieved the situation materially. It was very bad before, and I understand it is much better now.

Mr. THOMPSON. That is all, thank you.

Mr. BISNO. I would like to make an additional statement.

Mr. THOMPSON. Mr. Rosenberg does not appear to be here, and I have allowed time to examine him. I will now turn it over to the commission. I am through with this witness.

Mr. COHEN. I want to correct some things that Mr. Bisno has said. I would like a few minutes.

Commissioner COMMONS. Mr. Bisno wishes to make a statement on his own account, and after he has done that the commissioners will ask him questions.

Mr. BISNO. There are two items on which I wish to say something, which appear to me to be a serious risk to the existence of this agreement.

Commissioner WEINSTOCK. When you say "agreement" you mean the protocol?

Mr. BISNO. Yes; the protocol, and to its continuance and life; and I should like to speak of those two items. As has been said before, there are about 80 per cent of the people working by piece, and there is no standard for piece-workers, and the protocol has not as yet worked out a proper machinery for the settlement of these prices for labor. The protocol provides that the price for labor be settled by a committee of the shop and the employers. Usually the committee of that shop is not the competent party to settle the price for labor.

In the first place, they do not know what other people pay in other shops for the same kind of labor. In the second place, they are afraid that if they do not satisfy the boss in their opinion on the price of labor the boss may discipline them by discrimination. Then the boss has an immediate advantage in the settlement of the price for labor in this, that he can control some of them. He does not have to say it in so many words, but in substance he can say to a member of that committee, at least, "We will see that you do not get the class of work that the price is bad on, so that you give me the advan-

tage in the settlement of the price for work and I will give you a chance to make some money."

Commissioner WEINSTOCK. An indirect bribe?

Mr. BISNO. Yes, an indirect bribe. We did have cases where the bribe was direct; but the same thing runs all through the 2,000 shops, so that the price for pieceworkers is not maintained in the same way as we had that two years ago; so that I would suggest that the union and the manufacturers' society establish a body of experts whose business it should be to settle the price for labor.

Commissioner WEINSTOCK. A sort of a clearing house for all the manufacturers?

Mr. BISNO. Yes, for all the manufacturers; and that these experts be paid by both the union and the manufacturers' association together, and that they be officers not only of the one side or the other side but of both sides, and that they settle the price for labor on a given basis. I think that the union would even agree to assume that the price for labor as it is now is all right; take that as a basis, and maintain that in all of its shops. I believe that the manufacturers' association, as it is constituted to-day, and the union can not maintain the product efficiently enough until the manufacturers' association themselves will increase their membership by taking in almost everybody in the industry, because, as is stated to-day, it is the nonmembers of the manufacturers' association competing against the manufacturer's association that forces the members of the association themselves to work, if necessary, against the union, because, possibly, their business forces them. So that I believe that the members of the manufacturers' association ought to unite the two manufacturers' associations now existing, and then take in the others. I understand that they do not take in members as willingly as the union takes in members; that there is a sort of privilege over that. Unless they do that, this agreement will not have enough strength to live.

There is also the danger, which is now coming in vogue, of having both the manufacturers' association and the union competed out of business by those outside, scab shops, so to say, and scab unions and scab men, who manufacture goods cheaper than the union and the members of the manufacturers' association can, and therefore defeat the whole arrangement, and I feel that there ought to be made an effort on the part of the manufacturers' association and the union to get the States a party to this arrangement, to have the law give preference to this agreement, to establish insurance, out of work benefits, and sick benefits, and have the State be a party to these agreements and provisions. As it is now, there is danger of it being competed out of business, and we now have strikes in New York with men who are not members of the manufacturers' association applying to the manufacturers' association, cheaper than the members of the manufacturers' association, working with nonunion men; and you can get members of the union to become nonunion if a man is starving and you offer him a job; so that there is a serious position established by that situation to the whole arrangement, to the protocol agreement, the manufacturers' association, and the union, and everything else. I feel that the union and the association of manufacturers have got to work hand in hand, and that the State ought to help them on that. As it is, the only answer on this is violence, so far as I can see. The union does not want to see these other men take their jobs, and there is no way by which they can stop it, except violence, and they fight, and the condition of violence and the condition of peace in the industry do not seem to work hand in hand; so that I am in favor of the State becoming a party to these industrial agreements. The State does indorse labor unions.

Commissioner WEINSTOCK. Officially?

Mr. BISNO. Well, in a certain sense they are recognized. It is not officially; no. It ought to be.

Commissioner COMMONS. Mr. Bisno, I will ask Mr. Delano to ask you any questions that he wants to ask you.

Commissioner DELANO. I think you have pretty nearly answered it, but what I wanted to ask you was, whether in your judgment it was necessary in order to make trade agreements effective that the manufacturers should be organized so that they would act in cooperation?

Mr. BISNO. Yes; I really believe that the manufacturer ought to feel as strongly against the scab manufacturer as the union men feel against scab workers, because this unlimited competition destroys the manufacturers.

Commissioner DELANO. Do you think that organization ought to go to the extent, even, of allowing the manufacturers' organization to fix prices subject to State supervision?

Mr. BISNO. Oh, yes; I believe that within reason the thing ought to be controlled, so that the meanest of us do not get the advantage.

Commissioner WEINSTOCK. How would you get any of the manufacturers into the association? What method of procedure would you follow to bring that end about?

Mr. BISNO. I think that the union ought to be made to see that it is for the benefit of the union to have the manufacturers' association increase in strength, and the union can help with that materially.

Commissioner WEINSTOCK. Do you mean by the union men refusing to work for an employer who is not a member of the association?

Mr. BISNO. The union can bring the same sort of purpose into this. You see, you could not enforce it offhand, but the union can help a manufacturer to get out of business if he is not a member of the manufacturers' association.

Mr. WEINSTOCK. Let me understand that. What percentage of the workers are organized in New York?

Mr. BISNO. Almost all of them; about 95 per cent of them.

Mr. WEINSTOCK. About 95 per cent. Then, the matter, from the standpoint you now make, is really in the hands of the workers? They could control?

Mr. BISNO. The manufacturers themselves have a little clique among themselves, and they do not want the other fellows to get in and get the benefit.

Mr. WEINSTOCK. But by simply saying to the employers that they will not work for any man who is not a member of the association, just as they say to the employers, "You must not employ men who are not members of our union"—that is, they must join at a certain time—would not that force the manufacturers into the association?

Mr. BISNO. It would help matters.

Commissioner WEINSTOCK. Then, it is up to the union, rather than up to the manufacturers?

Mr. BISNO. It is up to a mutual understanding.

Commissioner WEINSTOCK. Were you here yesterday when Mr. Frey testified?

Mr. BISNO. Yes.

Commissioner WEINSTOCK. Do you recall what he said about arbitration—that he did not think that arbitration, in the sense of having an umpire, was wise or desirable?

Mr. BISNO. Yes.

Commissioner WEINSTOCK. Do you agree with that?

Mr. BISNO. No; I do not agree with that. I do not agree with his view.

Commissioner WEINSTOCK. You do not?

Mr. BISNO. No; I think he is wrong.

Commissioner WEINSTOCK. You think he is in error?

Mr. BISNO. Yes.

Commissioner WEINSTOCK. And that it is essential to have arbitration with an umpire to maintain industrial peace?

Mr. BISNO. Yes. I think at least that power ought to be there. I feel like Mr. Brandeis does, that that power ought not to be used easily or indiscriminately, because it is difficult to make industrial legislation. It is a new field of human endeavor, and we are very much inexperienced in that. It is much more complicated than social legislation or civil legislation. But each side knows that there is somebody who, when they pass a certain line in equity, a certain line in thought, has the power to act, and they guide their own conduct in the light of what they can see this fellow is doing and is saying and they can agree. But if they feel that if the other fellow has a momentary advantage, he will make use of it—

Commissioner WEINSTOCK. These two arguments have been offered, pro and con, for and against the use of an umpire. On the one hand it is contended that having a board of arbitrators or conciliators will shift the responsibility to the board of arbitrators, and will therefore delay action; that rather than yield a point which might make them unpopular with either side, they would prefer to let that be done by the board of arbitrators, so that they will be held blameless by their organization or the bodies that they represent. On the other hand, it has been maintained that the very fact of there being a board of arbitration would tend to lead the conciliators to agree, believing that they could get better results among themselves, and that they might not fare so well

at the hands of a board of arbitration as if they had adjusted the difficulties among themselves.

Mr. BISNO. The first argument that you say is against it, in my opinion is for it. Here is the situation. I represent the workmen, we will say, and you represent the employers.

Commissioner WEINSTOCK. Yes.

Mr. BISNO. The workmen say, "We want to have 8 hours." The employers say, "We want to have 10 hours." If I should say to you, "Let us split it in half and make it 9 hours," I lose my job. If you say to me, "Let us split it in half and make it 9 hours," you lose your job. The result of it is that I say to you, "I will stick to 8 hours," and you say to me, "I will stick to 10 hours," and then we go out and fight. Then we put in the third man to pass on it, and you get somebody to unload your troubles on and I get somebody to unload my troubles on.

Commissioner WEINSTOCK. The responsibility is shifted.

Mr. BISNO. Yes.

Commissioner WEINSTOCK. And the third man becomes the goat, as the saying is?

Mr. BISNO. Yes; and the shifting of the responsibility becomes, in the very nature of things, an aid instead of a hindrance, to stop us from fighting. So that when they say they find fault with the arbitrator, because we unload our troubles, I find that very argument in favor of having an arbitrator.

Commissioner WEINSTOCK. In favor of having an umpire?

Mr. BISNO. Yes; as the most substantial argument in favor of it.

Commissioner WEINSTOCK. It becomes a perfect safety valve for both sides?

Mr. BISNO. Yes.

Commissioner LENNON. I prefer to submit written questions to all these witnesses. There are a great many things upon which I desire information, and I do not care to go into them now.

Commissioner COMMONS. We want to hear Mr. Cohen, but there are one or two questions that I would like to ask you with reference to whether the union itself does not scab on other unionists by going to work for these nonassociation shops at lower prices than it works for the association shops?

Mr. BISNO. Yes; as to the standard for pieceworkers, and in some shops in the association we work for more and in some shops out of the association we work for less, and vice versa.

Commissioner COMMONS. Apparently your recommendation goes no further than to put it up to the employers. You say to the employers, "All of you get together and then expel a man who does not live up to the association standards." On the other hand, that man would just as soon be expelled on account of refusing to live up to that standard, because the union itself has no standards.

Mr. BISNO. I have suggested that the manufacturers' association and the union establish a system of experts and establish those standards, and that they be enforced by everybody, members of the association and nonmembers of the association.

Commissioner COMMONS. According to that, then, the union could go ahead and enforce it on nonassociation members, even though the association was not strong enough to bring in those members?

Mr. BISNO. That is it. Yes; that is exactly how we did. The truth is that there has worked out a condition of those matters where the members of the manufacturers' association themselves helped the nonmembers of the manufacturers' association, and defeated the purposes of the union, by way of sub-manufacturers, and so forth.

Commissioner COMMONS. How large a committee would this price-fixing committee have to be?

Mr. BISNO. We have figured it at about 50 men.

Commissioner COMMONS. How many prices do you have to fix in the New York protocol each year?

Mr. BISNO. Hundreds of thousands. We figure that about 50 men could do the work.

Commissioner COMMONS. Twenty-five on each side, you mean?

Mr. BISNO. No; about 50 on each side.

Commissioner COMMONS. One hundred men would have to be on the price-fixing committee, then?

Mr. BISNO. I think, in the course of time it would work out so that one man on each side could do it, by arranging a certain standard. The expert

should be a man who would be able to say how long it would take to make a given garment, so that the price of that garment could be determined in accordance with the rule laid down on the earning capacity.

Commissioner COMMONS. Suppose that one man has 200,000 new garments to consider.

Mr. BISNO. We will say, then, that 50 men can do that work, or 100 men. I figured that about 50 men would be able to do that work.

Commissioner COMMONS. According to that, they would have to increase their dues and expenses high enough to pay for 50 men on each side?

Mr. BISNO. Yes.

Commissioner WEINSTOCK. They would be doing productive work, however.

Mr. BISNO. The union has enough money, and it would be so much saving. To-day we have in every shop five men and there is so much haggling and bargaining now because it is not done on expert knowledge, and it costs our men probably \$5, where it should cost us 5 cents, in making the price.

Commissioner COMMONS. Does the union pay its shop committee for the time lost in this price fixing at present?

Mr. BISNO. No. Sometimes it does and sometimes it does not. It depends upon the nature of the shop.

Commissioner COMMONS. Well, it is a loss, anyway?

Mr. BISNO. Yes; it is a loss, whether the union pays the committee or not. The men lose the time.

Commissioner HARRIMAN. There is one question I wanted to ask, although perhaps you have answered it already: What is being done about the members of the manufacturers' association who go and buy from nonassociation shops?

Mr. BISNO. So far we have no answer to that. We have been trying to solve that question. If a real price committee is established, to settle all these prices, we will try to amend the agreement with the manufacturers to consider every place they buy as a contractor, and hold him responsible for the same conditions that prevail in his shop. To-day, really, every manufacturer has it within his power to, and does, violate the provisions of the agreement by having a contractor make the work for him where it runs less than what the agreement provides for, and he calls that buying, submanufacturing, and so on; but it is violating the provisions of the agreement, and it is being done very extensively in this form of buying.

TESTIMONY OF MR. JULIUS HENRY COHEN—Recalled.

Mr. COHEN. I am very sorry that the commission has gone into matters that are clearly debatable and involve careful inquiry as to the facts; first of all, as to this matter of buying merchandise. Mr. Bisno has made a contention, and other people have made contentions, and those contentions are now being considered by the board of arbitration in the industry, and I regard it as utterly unfair to give any impressions of unfair conduct on the part of the manufacturers with regard to it, when the only way of determining the facts is by careful investigation into them.

For example, Mr. Bisno's statements with regard to the number of deadlocks was a chart made before the board of arbitration over a year ago, as a result of which Mr. Winslow, of the Department of Labor, was directed to make a complete study and investigation, and his report is now in the hands of the printer, and I assume will be considered by you. I have seen the reports and the facts show that there has not been any such number of deadlocks, nor any such difficulty as the representatives of the union have argued before the board of arbitration.

By way of illustration, in the dress and waist protocol, which I know all about, they have no committee on immediate action there. Miss Israels is in charge of the labor department of the association, and Mr. Pollocks and Mr. Zimmerman for the union; and they get along without any deadlocks and without any committee on immediate action and without any umpire, at the present time. Only one case has gone to the board of arbitration.

I want, upon the record, to deny that there has been any bribing of price committees or attempts at bribing that the association has known about. There was a case of a shop chairman, where the employer tried to bribe the chairman, and upon a disclosure of the facts he was expelled from the association.

Any suggestion that there is any chance of bribing the price committees in the association shops is a slander that you ought not to permit to get upon your records—certainly without my denial being made, in my presence.

In the next place, I think that any suggestion made to this commission that the only alternative to a peace agreement, a collective agreement, is the use of violence, is a suggestion that should, least of all, be made by a representative of a labor organization.

Mr. Bisno has stated here that he did not see any remedy for the situation unless the association took in everybody except for the union to use violence.

Certainly I can not listen to that without expressing my protest. The process is a process of education of the working people. There is a great problem in the dress and waist industry to get the girls to join the union. The girls join the union reluctantly. It is to be done by a process that the trade-unions in this country have followed for years, of educating the people to the value of trade-unions.

As to the proposition that the association has some kind of a clique or monopoly; that is absurd. There has never been a single manufacturer who has applied for membership in the association who has been rejected, so far as I know.

The association has made the condition that he must have a sanitary certificate from the board of sanitary control to show that he maintains the sanitary standards required; but, as has already been observed by the members of this commission, membership in this association involves an expense. It costs money to keep up the method of sanitary control, to keep up the board of arbitration. The wage-scale inquiry in the dress and waist industry alone cost \$40,000, of which the association contributed one-half and the union one-half. Every one of these statistical investigations costs money. No man can join the association unless he is ready and prepared to pay his dues, to pay his share of the dues. In the dress and waist association there is an endeavor made to equalize the obligations according to the amount of business or the number of machines a man has. I have never yet, until it was suggested here to-day, heard that there was any effort on the part of any of the employers' associations in New York to monopolize the employers or to keep them in the group. The whole effort seems to be on the part of gentlemen who think, as the previous witness does, to impose upon the employers' association the whole duty of establishing conditions throughout the industry. In other words, they find the collective agreement works so well in its operation upon members of an employers' association that they want every employer to join the employers' association.

The reason for that is that if a man is caught not observing the protocol he is disciplined by his own association. It is a great deal easier to discipline a member of the association through the association than to conduct a strike against one who is not a member of the organization. The great labor which has been entailed upon the officers of the two employers' associations has been such as nearly to break down the health of some of the officers, because of the immense amount of time they have had to put in on committees of discipline and the like. The effort is now to see to it that the machinery provided under the protocol takes the place of that.

I should regret very much to see any impression created here that there are great violations of the protocol in the buying of merchandise. Do not forget that the nonmember of the association can buy his merchandise as he pleases, and the jobber can buy his merchandise as he pleases; and any restriction upon the members of our association in buying merchandise will simply mean that they will resign from the association and become jobbers of merchandise. If it is so important to the union to keep up our association by increasing its membership, it is important for us to keep our present members in the association. You can not limit a manufacturer to buying lines which he does not make himself in order to fill the orders of his customers. However, that is a matter that is controversial, and is now pending before the board of arbitration; and, in my judgment, nothing should have been introduced into the records of this commission of that kind, because I understand that we are here not to try the issues that may have arisen under the protocol, but to consider the question of the value of collective bargaining, mediation, conciliation, and arbitration.

I regret very much that it becomes necessary for me to take up these controversial matters and record my protest and my exception to some of the statements of fact that have been made here.

Commissioner O'CONNELL. I want to ask you a question—

Mr. COHEN. Just one more thing first, please.

I also want to protest against the proposition advanced by the previous witness, that the union should be authorized by law, or approved by law, to tell a manufacturer to get out of business if he does not join the employers' association. I think that is not only illegal, as involving a conspiracy, but that it is un-American. It is just as un-American as compelling a worker to get out of the industry because he does not belong to his association.

Commissioner O'CONNELL. For the benefit of the record, what is meant in the protocol, or in the arrangement you have in New York, with a preferential shop?

Mr. COHEN. Exactly what is stated in the protocol. The words were carefully devised to meet a situation. I can not quote the exact words, but—

Commissioner O'CONNELL. Give us your interpretation of them, then.

Mr. COHEN. I do not want to give you my interpretation of them; I want to give the exact words. As nearly as I can recall them, they are that in hiring help the employer gives the preference to union men, but without any order among union men—not obliged to follow any list—and the clause expressly recognizes that there are differences of degree of skill. It respected existing obligations to nonunion men at the time of the signing of the protocol, and it also provides that the employer agrees to maintain a union shop, meaning thereby, as the language expressly states, a shop in which union conditions of hours and labor prevail; and the employer also is to state that he recognizes the moral obligation on the part of his workers to carry the burdens for the institutions that are for the benefit of his associates.

In actual practice that means, Mr. O'Connell, that the employer assists the union in unionizing the shop, because it is made clear to the union employee that the employer belongs to an association that is working in cooperation with the union, and that the employer prefers to have union people in his employ; but it means that the shop is open to anybody and the union is open to anybody who wants to come into the industry and is competent to do the work; and the implication of it is that the union must maintain reasonable dues and reasonable initiation fees, so that they can not keep anybody out. There has never been any question about that at all, because this union has always been an open union in that sense.

Commissioner O'CONNELL. In case of a reduction of force the union man would be given preference as to retainment?

Mr. COHEN. That is the basis in a great many shops, but I do not understand that that is the necessary interpretation of the protocol.

Commissioner O'CONNELL. And, in the reinstatement of men, with the picking up of business, union men get the preference?

Mr. COHEN. That is the basis, but it is not a necessary interpretation of the protocol.

Commissioner O'CONNELL. In your interpretation of what is commonly known as the open shop, would you consider that an open shop?

Mr. COHEN. No, sir; that is not an open shop. An open shop is where the employer takes in anybody that comes along, regardless of his affiliations with the union. May I say this, in further amplification—

Commissioner O'CONNELL. I just wanted to get that, for the benefit of the record, because some statements have been made here in regard to open shops.

Mr. COHEN. I want to say, in amplification of the record, that where the protocol works, where the collective agreement works, the manufacturer finds an advantage in having practically all of his shop unionized, because then he has the discipline of the union to enforce against its members. But where the union is arbitrary, where it makes unreasonable demands through its committees upon the employers, you have the manufacturers not keen about getting their men to join the union. Where the union operates as Mr. Schaffner describes it did operate in Chicago, with a man who understood the spirit of collective agreement, the result is that the shops become practically thoroughly unionized, with a very candid and frank cooperation of the employer himself—not by collecting dues or bringing any pressure to bear, but by simply letting it be known that he actually prefers to have union men in his shop.

Commissioner O'CONNELL. But in the case of Hart, Schaffner & Marx, they have absolutely union men; nobody can work in the department but a union man.

Mr. COHEN. I did not understand that.

Commissioner O'CONNELL. Yes.

Commissioner COMMONS. Perhaps Mr. Schaffner will answer that question, or Prof. Howard.

Prof. HOWARD. That will be brought out later, Mr. Chairman.

Commissioner COMMONS. Yes. I want to ask a question about that, later.

Mr. COHEN. There is one other thing that I omitted, Mr. Chairman, and that is with regard to the piece-price experts.

Mr. Bisno has overlooked the fact that six months ago there was created a piece-price division of the board of grievances, with experts to settle these questions, controversies in the shop. That is in operation; and in the dress and waist industry we have a wage scale board now in operation that is settling these prices. The real problem is not in getting people to go to the shops and settle piece prices, but to have a standard by which anybody settling prices can be governed. That is the economic problem; that has not been solved, and can not be by the creation of any legal institution. What has been done is what Dr. Stone is doing now in the dress and waist industry, to see whether it is possible to standardize the prices for making women's garments, in the way in which prices have been standardized by Hart, Schaffner & Marx in the making of men's garments.

The difficulties in the way of standardizing prices for women's garments are that the styles vary, and vary with such rapidity that that constitutes an inherent difficulty in this industry. The real problem is not the problem of finding the experts, because that is under way now. The real problem is to find the things by which the experts shall be guided. That is the problem. That is not to be ascribed to the protocol, and is not caused by the protocol any more than slavery was caused by the Federal Constitution. It exists in the industry.

Commissioner WEINSTOCK. Is that a problem? Your unit is a question of time; is it not easy to take time as the yardstick and determine the value?

Mr. COHEN. That means the time basis is the solution?

Commissioner WEINSTOCK. Yes.

Mr. COHEN. Neither the union nor the manufacturers are willing to put the time basis in operation. Pieceworkers making \$60 to \$75 in the height of the season do not want to go on a time basis of \$30 a week.

Commissioner COMMONS. You are using the words "time basis" in a different sense; not in the sense of payment by the week, or by the day, but—

Commissioner WEINSTOCK. The length of time it takes to do the piece of work.

Commissioner COMMONS. By the time clock or by the watch?

Commissioner WEINSTOCK. Yes.

Commissioner COMMONS. Do you measure the time by each operation? Do you do that in any way?

Mr. COHEN. You can not do that because of this reason: The moment you work on a time operation—to pay so much per hour for the work, which is what we call a time rate—they want to introduce the time rate. Take, for example, in the dress and waist industry; you have to-day a testing system, which is based upon the theory of the estimated number of hours it will take to make the garment at 30 cents per hour. In other words, a new waist comes into the shop. You are the boss and I am on the price committee. We try to figure out how much it would take to get an ordinary operator to make the garment and we multiply the number of hours by 30 cents, and that is the price. It does not work, and the reason it does not work is because neither you nor I can estimate with sufficient accuracy the number of hours to be used. It is impossible to make a guess that will be satisfactory. It is an illustration of what was remarked by Mr. Bisno in describing conciliation versus arbitration; you lose your job if you are too high for the boss and I lose my job if I am too low for the workers. No; the time solution is not the solution. The solution is, in my judgment—I am not an expert on it at all—along the lines established by Hart, Schaffner & Marx in connection with their manufacture of men's clothing. I think they have gotten down to the point where there are 500 operations in the making of some of their garments.

Mr. HOWARD. I think it was 150 or 160.

Mr. COHEN. That is enough; 150 or 160 operations. It is like the system in England in the men's tailoring industry, which is on the same general principle. I am not giving accurate figures, but it is estimated that a good operator will take an hour to set in a sleeve. All right; it is paid on the basis of a standard rate, and if the man does it in half the time he makes a profit on it, and if it takes twice the time to do it he makes less. But the difficulty is, taking women's garments, with the changes of styles, to do it in such a way as to make a proper rate—and that is a job for the economist and the efficiency

engineer—and the man does not live who can solve that problem; and because of that we have the constant fight to find the basis on which that shall be done.

Commissioner COMMONS. Just a question on the definition. According to the definition, preferential shops may be either union shops or open shops?

Mr. COHEN. Well, you will have to define "union" and you will have to define "open."

Commissioner COMMONS. A union shop would be one in which, as a matter of fact, all of the employees are members of the union.

Mr. COHEN. That is not our understanding of a union shop. The definition of a union shop, according to the protocol, is one where union conditions and hours and conditions of labor prevail and where the employer gives the preference to union men. That is the definition in the protocol of a union shop.

Commissioner COMMONS. Yes; but the ordinary meaning of "union shop" in the contest between employers and employees, as it has been defined to us by the unions here, is that they stand for a union shop, namely, that a man may be admitted to the shop as a nonunionist, but in the course of time he must recognize his obligation to pay dues and support the organization.

Now that, according to your practice there, would come out much the same as the preferential shop; that the employer would let it be known that he preferred to have union men, and as a matter of fact, they would all come into the union?

Mr. COHEN. The effect may be the same, but the difference is a vital difference. It is a difference of method. In one case the union man says, "I will not work by the side of a nonunion man"; and when that is carried out as a general policy in an industry, as it was sought to be in the cloak strike of 1910, it is illegal, and it should be illegal.

Commissioner COMMONS. Would not that be properly called a closed shop, where the union says they will not work with a man who is not a member of the union? The employer then must make his choice between all union men or all nonunion men. Would not that be a closed shop?

Mr. COHEN. I think what you described before is a closed shop, because if it is only a question of an hour or a week before the man shall become a union man, the result is exactly the same. The union man says, "After a certain interval of time, I will not work in this shop with a nonunion man." In the preferential shop the nonunion man is not under any pressure at all. The union man does not say, "I will not work in the shop with a nonunion man." As a matter of fact, to-day we have old men in the cloak industry who have not joined the union since the strike of 1910, and they are not coerced into joining the union, and nobody forces them to join the union, and the union leaders do not try to force them to join the union. They say, "We do not want to join the union," and nobody forces them to.

Commissioner COMMONS. I understand from Mr. Schaffner that in some cases about 40 per cent of the employees were not members of the union and, yet, that is a preferential shop. Would you call such a situation as that an open shop?

Mr. COHEN. No; not an open shop. It is an open shop in this sense, that anybody can come in; but it is not an open shop in the sense in which the trade unionists use the term. In this dress-waist industry, where there has been some difficulty experienced in retaining their girls in the union and in getting them to join the union, there are a substantial number of shops where the number of union members is in a minority instead of a majority. There is all the difference in the world between the method of coercion and the method of education. The theory of the protocol is that a man joins the union because he is made to believe that it is his moral duty to belong to the union and help to support the institution. In the other case he is made to believe that he can not live in the industry unless he joins the union. There is all the difference in the world there; and there is the difference in the strike of 1910; and if this bridge had not been found, there never would have been this agreement between the workers and the manufacturers.

Commissioner WEINSTOCK. If a nonunion man has a grievance in a shop, can he get that adjusted just as fairly and as promptly as a union man can?

Mr. COHEN. He can not get it adjusted through the machinery of the union; and he has not the right to have it adjusted in that way. He has got to go and take it up directly with his employer.

Commissioner WEINSTOCK. I see. Then, he is at a disadvantage?

Mr. COHEN. He is; and should be.

Commissioner O'CONNELL. The tendency of the protocol, then, is to lead the men into the union?

Mr. COHEN. It is.

Commissioner O'CONNELL. The whole machinery tends to bring them into the union—employer and employee?

Mr. COHEN. Yes.

Commissioner O'CONNELL. In forming that protocol, did you have any special assistance from the international union?

Mr. COHEN. In forming the protocol the international officers negotiated it. In the dress-waist industry the international officers united in forming the protocol.

While I am upon this point, may I say that there is always, of course, the difficulty of harmonizing the interests of the local with the interests of the international; but it is my judgment, right or wrong, that it is more desirable to have a collective agreement with an international organization, with leaders of national responsibility, than it is to have one with a local, and, so far as my acting as counsel is concerned, I would never advise an employers' association to sign an agreement with a local.

Commissioner BALLARD. Is the action of the union decisive in the handling of that situation, and is there a sympathetic strike if there is trouble elsewhere?

Mr. COHEN. No, sir; nothing of that sort, and that never has been thought of by anybody.

Commissioner COMMONS. We are much obliged to you, Mr. Cohen. We want to hear Mr. Howard for five minutes, now.

Commissioner WEINSTOCK. Just one more question. You stated this a little while ago and there was a conflicting statement there, and I could not get this clear in my mind. On the one hand, you seemed to think that it was a mistake to have partisans on the arbitration board, and, on the other hand, you pointed out that an outsider would not be familiar with the conditions involved, and could not pass judgment intelligently.

Mr. COHEN. I said that in my judgment the bringing in of outsiders for a specific controversy that involved conditions of the trade would not result in success, because those people would deal with the situation superficially; but bringing in outsiders and constituting them a permanent tribunal, as we do under the protocol, with Mr. Brandeis and Mr. Holder(?), they became educated and know the importance of the interests involved.

TESTIMONY OF MR. EARL DEAN HOWARD—Recalled.

Commissioner COMMONS. Mr. Howard, will you kindly answer one or two other questions?

Commissioner O'CONNELL. Professor, for the purpose of correcting an impression I got this morning, you there gave it as your opinion that the shop of Hart, Schaffner & Marx was an open shop.

Mr. HOWARD. I believe that I said it was a preferential shop. I understood that it was a preferential shop.

Commissioner O'CONNELL. Will you put in the record what you understand a preferential shop to mean?

Mr. HOWARD. Our first agreement came to an end a year ago last spring, after two years, and there was great controversy on that point. In fact, that was the only controversy that was really difficult in getting a new agreement for three years. The preferential shop is defined in the agreement we finally reached. The firm agreed to this principle of preference, which is on page 16 of the little book.

Commissioner O'CONNELL. Yes; I have it here. Let me ask you some questions.

Mr. HOWARD. Very well.

Commissioner O'CONNELL. In the employment of people for the firm, are union men given the preference?

Mr. HOWARD. If there are union men available, they have the preference of employment.

Commissioner O'CONNELL. You apply to their representative or agent to furnish the men if he can?

Mr. HOWARD. Our custom is to make requisitions.

Commissioner O'CONNELL. In the reduction of your force, are union men given the preference? Nonunion men are laid off first?

Mr. HOWARD. Wherever it is necessary to make a permanent reduction of the forces we divide the reduction equally during the slack time, and where it is necessary to make a permanent reduction of the force that is a matter that must be decided by the deputies. The great beauty of our whole arrangement is its flexibility. This matter of these divisions, lettered A, B, C, D, and so on, which you find in the agreement, was a device which we worked out to assist the chairman of the trade board in deciding whether sections were overcrowded, and how to handle them if they were. You will find that these are, however, only temporary, because if it should occur that the people in class A, who are supposed to consist of union people, should determine that they prefer to be nonunion, it would authentically become a nonunion section. It is not a permanent thing, so that you can not say that those sections are closed.

It provides here, in another section below, that if another class becomes organized it then assumes the same position in the arrangement as does class A, and it becomes union at once, and only union men can be employed in that section; that is, providing that any new men augment the section.

Commissioner O'CONNELL. Is this preference, in terms of employment and so on, in any way in conflict with the well-known definition of an open shop?

Mr. HOWARD. We have always been an open shop. Under the present agreement about 80 per cent of the coat shops are nonunion and 20 per cent union. The trousers shops are about 60 per cent union and 40 per cent nonunion.

The beauty of the whole thing is its flexibility. A great many people who have been educated to the point where they would become good unionists do not care to. Especially among Catholics there is opposition to the union and there is opposition to it by the parents of the younger girls, because they do not care to have them go to meetings at night.

Commissioner O'CONNELL. Have you had an experience of that kind?

Mr. HOWARD. Yes; frequently. Those matters are taken into account with the deputies and the deputies have been very fair about it. We have usually considered these things on the rule of justice, the rule of reason, and we have departed frequently from the letter of the law, by mutual consent, because, as I have said, Mr. Hillman has developed a very high sense of justice, and if we can find that in a particular controversy there is a rule of justice and reason that is apparent to both of us we follow that, notwithstanding the letter of the law; and Mr. Hillman's influence is so high with his own people that he can explain it to them, and his explanation is accepted.

Commissioner O'CONNELL. The reason that induces men to go into the union is because of the preference they get in their positions, and the preference in treatment they get, in the laying off of men, and so on. Is not that true?

Mr. HOWARD. In a great many sections it is not necessary to lay them off in the summer time.

Commissioner O'CONNELL. Well, not that. If I can obtain a job by joining the union, I will naturally do so. There must be a purpose in a man joining a union.

Mr. HOWARD. I think the majority of the sections containing men who are fairly permanent and who are fairly skilled in their trade will become union, and as soon as they are educated so as they understand the agreement, and will then have a sense of justice to abide by the rules.

Commissioner O'CONNELL. The purpose in having a protocol, an agreement, or whatever you may call it, is that there must be some inducement for it. What they had in mind must have been to lead men in in order that they may deal with them generally, on some plan of incorporation, rather than individually.

Mr. HOWARD. You see, this whole thing has been a matter of education.

Commissioner O'CONNELL. Yes; that is all.

Commissioner WEINSTOCK. Do you deal only with the representatives of your own workers, or do you deal with the representatives of the federation?

Mr. HOWARD. It happens that the representatives of our own workers are the only representatives with whom we have to deal.

Commissioner WEINSTOCK. You do not deal with the representatives of the national association?

Mr. HOWARD. Not at all. The national association is very much in disfavor. Indeed, there is a great deal of antagonism between the local organizations and the national in our city.

Commissioner WEINSTOCK. You differ in that with Mr. Cohen, who said that he would not advise an employer to negotiate with a local. You negotiate only with the local?

Mr. HOWARD. Yes.

Commissioner WEINSTOCK. How do you get the highest efficiency from non-pieceworkers?

Mr. HOWARD. The piecework system itself takes care of that.

Commissioner WEINSTOCK. Is it all piecework in your business?

Mr. HOWARD. Wherever it is possible. Practically 95 per cent of it in all the sections.

Commissioner WEINSTOCK. You do not have that other problem to deal with?

Mr. HOWARD. No.

Commissioner DELANO. Is the local with which you deal affiliated with the American Federation of Labor?

Mr. HOWARD. Mr. Hillman can answer that.

Commissioner O'CONNELL. It is, in the international department.

Mr. HOWARD. Yes; they sign themselves "International Garment Workers of America."

Commissioner DELANO. Do your trade committees settle troubles in which these nonunion men may be involved?

Mr. HOWARD. No. The representatives of the employees, the real representatives who represent the unions, have nothing to do with nonunion people. They are taken care of by the Labor Department. The Labor Department hears all grievances first and makes an effort to correct all of them, wherever they exist. They correct any union complaints and nonunion complaints, and they are disposed of in the same way, of course, and there is no appeal for the nonunion man, whereas there is for the union man.

Commissioner DELANO. You spoke of Mr. Hillman accomplishing a great deal by his sense of justice. I got the impression that he helps out in the case of nonunion as well as union men. Is that correct?

Mr. HOWARD. Of course, Mr. Hillman is a very liberal-minded man. We have discussed problems concerning nonunion men together.

Commissioner O'CONNELL. But the benefits secured by the union men are secured also by the nonunion men, are they not?

Mr. HOWARD. No; only to this extent: A complaint comes to a deputy on either side, then it is brought to me, and I have the first judicial settlement of it, but that is as far as the nonunion man can go. If he union man objects to my decision he can go to the trade board, and if he objects to the decision there he can go to arbitration.

Commissioner O'CONNELL. Suppose you make an increase in wages of 10 per cent. Do you give that to the nonunion men?

Mr. HOWARD. We have never had a case of that kind; we do not increase wages in that way. Generally, when the first increase was made, we had a 10 per cent increase given, and that 10 per cent applies to everybody, of course.

Commissioner COMMONS. We are much obliged to you, Prof. Howard.

At the afternoon session the commission will divide into two sections. In this room those concerned with the printing trades will appear, and in the offices of the commission, on the ninth floor of the Southern Building, across Fifteenth Street, those concerned with the building trades will appear at 2 o'clock.

(At 1 o'clock p. m. the commission took a recess until 2 o'clock p. m.)

AFTER RECESS—2 O'CLOCK P. M.

PRINTING TRADES.

Pursuant to the arrangement announced before the noon recess, that portion of the commission to consider the printing trades met in the assembly room of the Shoreham Hotel at 2 o'clock p. m.

Present: Commissioners Commons (presiding), Weinstock, and O'Connell.

Present also for the commission: Mr. George E. Barnett, special investigator, and Mr. F. H. Bird, superintendent Division of Public Agencies.

TESTIMONY OF MR. JAMES M. LYNCH.

Mr. BARNETT. Mr. Lynch, will you give the reporter your name and present address and official position?

Mr. LYNCH. James M. Lynch, commissioner of labor of the State of New York; Syracuse, N. Y.

Mr. BARNETT. Will you also state, Mr. Lynch, what official connection you have had with the International Typographical Union?

Mr. LYNCH. I was its president for more than 13 years.

Mr. BARNETT. What dates?

Mr. LYNCH. From the latter part of 1900 until January, 1914.

Mr. BARNETT. Will you describe the original form of the arbitration agreement between the International Typographical Union and the American Newspaper Publishers' Association?

Mr. LYNCH. The agreement, in its original form, made in the latter part of 1900, and effective for one year, provided for the arbitration of the disputes arising under a written or verbal contract, and the arbitration was to be a board consisting of three men, the president of the International Typographical Union, the commissioner of the American Newspaper Publishers' Association, and a local man chosen by them, who acted as chairman of the board. Shall I go on?

Mr. BARNETT. I would like to have you state at this point what the substantial parts of the arbitration were. What did they secure to the publishers who had such arbitration agreements?

Mr. LYNCH. Under that first agreement, under a written or verbal contract, it secured the continuation of work and the appearance of his paper regularly.

Mr. BARNETT. There was to be no cessation of work under that contract?

Mr. LYNCH. No cessation of work under that contract; no.

Mr. BARNETT. What was the first change made in the form of the agreement?

Mr. LYNCH. The second agreement provided for arbitration of disputes arising in the making of new labor contracts, and also for the arbitration of disputes arising under those contracts.

Mr. BARNETT. At what time did that take effect?

Mr. LYNCH. That was in 1901, I think. By the way, I have those agreements, or I expect them here. I had hoped they would be here this morning, but they have not yet arrived.

Mr. BARNETT. We will be glad if you will file copies of them with the commission.

Mr. LYNCH. That agreement was for five years, and retained the arbitration board made up as I have described it, and with the addition of arbitration of disputes arising under the making of new contracts, which meant arbitration of wage scales.

Mr. BARNETT. That agreement was to extend from 1902 to 1907?

Mr. LYNCH. Yes.

Mr. BARNETT. Was that agreement satisfactory? Did it work out satisfactorily?

Mr. LYNCH. No; it did not work out satisfactorily so far as the arbitration board was concerned. It was not satisfactory so far as the selection of the third man was concerned.

Mr. BARNETT. What was the difficulty?

Mr. LYNCH. It seemed to be in what we called the hit-and-miss character of the third man's decisions, the impossibility of teaching him the newspaper business in the course of the arbitration of the dispute.

Mr. BARNETT. You heard Mr. Cohen testify this morning as to the very great advantages which have accrued under the New York protocol from having clergymen and university professors and lawyers decide the cases—although I do not believe clergymen have decided the protocol, but professors and lawyers. Was your experience similar to that of Mr. Cohen?

Mr. LYNCH. That is, under the second agreement?

Mr. BARNETT. No; the first agreement, as to the arbitrator?

Mr. LYNCH. It is the second five-year agreement. Our experience with the clergymen and others was not satisfactory, not satisfactory at all. In very few cases, I think, was the third man able to grasp the issues involved, and able to understand the conditions in composing rooms, and able to get a grasp of the newspaper business generally.

Mr. BARNETT. Was any change made in the agreement between 1902 and 1907?

Mr. LYNCH. There was no change made that I remember in that agreement, but in the next agreement the local board of arbitration was changed to four men, two representing the publishers, two representing the union, with an appeal to the international board, made up of the three members of the executive council of the International Typographical Union and the three members of the special standing committee of the Newspaper Publishers' Association. That agreement worked out very satisfactorily so far as the settlement of disputes was concerned, except that there were very few occasions when the local board was called into existence. The publishers and the union would

attempt to make selections and fail, and then the cases would be referred, under the provisions of the agreement, to the international board, which met at Indianapolis; and as a result all of those cases were coming to the international arbitration board. While they settled them, yet it was not satisfactory to the members of that board. But they did settle all with the exception of one case.

Mr. BARNETT. Was it the idea that those four men in the local board should be members of the union and publishers, or was it the idea that they should select independent men?

Mr. LYNCH. They could be members of the union. They were selected by the union with perfect freedom and the publishers with perfect freedom. They could be outsiders, but the practice was they were members of the union.

Mr. BARNETT. Those boards were very rarely formed?

Mr. LYNCH. Very rarely formed.

Mr. BARNETT. In 1912 you formed a new agreement with the American Newspaper Publishers' Association?

Mr. LYNCH. Yes.

Mr. BARNETT. And that is to run until 1917?

Mr. LYNCH. Yes.

Mr. BARNETT. What change was made in that agreement with reference to these local arbitration boards?

Mr. LYNCH. The first was composed of five members, one member the direct representative of the publisher, one member the direct representative of the union, one member to be chosen by the publishers who was not associated with the publishing industry, one member to be chosen by the union who was not associated with the trade unions, and they to select the fifth member, who acts as chairman of the board. The full board hears the cases presented, and then the four original members retire in executive session and attempt to come to an agreement on all questions in dispute, and if they are unable to agree on all of the questions, or any of them, they then call in the chairman, and he has a vote on the disputed question. They have tried to limit the activities of the local chairman as much as possible.

The ACTING CHAIRMAN. I did not understand how that second employer representative is selected?

Mr. LYNCH. He is to be an employer who is not associated with the newspaper industry.

The ACTING CHAIRMAN. Any employer outside of the newspaper industry?

Mr. LYNCH. Yes; any employer outside of the newspaper industry.

Mr. BARNETT. Anybody but the particular employer whose contract is being arbitrated?

Mr. LYNCH. An employer or association of employers.

Mr. BARNETT. Has that reduced the number of cases coming up to the international board?

Mr. LYNCH. I think it did. It was in operation comparatively a short time when I ceased active connection with the organization as an officer and it has not had an opportunity to work out yet. I think it has reduced the number of cases.

Mr. BARNETT. What kind of questions do the local board and the national board have power to settle? Have they power to settle any questions and all questions relating to the relations of employers and employees, or are there reservations?

Mr. LYNCH. They can pass on disputed questions as to wages, hours, and working conditions; they can not pass on the international law; they can not arbitrate as to whether the office shall be a union office or not; nor can they pass on any local law that does not affect wages, hours, and working conditions. Even though the international law may deal with them, they can not arbitrate them, nor can the employer, because he accepts them when he signs.

Mr. BARNETT. Then the union office is part of the international law—the union?

Mr. LYNCH. Yes.

Mr. BARNETT. So that the international agreement is only made with union publishers?

Mr. LYNCH. The agreement is made in the first place with the I. T. U. and the A. N. P. A., and it is optional with the publishers' association and the local union as to whether they will make this agreement effective or not. The two parties provide a commissioner for arbitration, and it is then conditional for the union and the publishers whether they will accept it or not, but in this new

agreement in the majority of instances the newspapers and unions had arbitration agreements under the old agreement from 1907 to 1912, and they accepted the new agreement. There may be some exceptions.

Mr. BARNETT. What are the shop rules embodying the international law of the typographical union; what are the chief rules which would concern the publisher, in which he is concerned, which are laid down in the international law?

Mr. LYNCH. Well, the six-day law would concern him; the general policy of the union office would concern him; the laws relative to apprentices would concern him; the law relative to reproduction of previously used matter also would concern him.

Mr. BARNETT. And the priority law?

Mr. LYNCH. The priority law also would concern him, and there are several others.

Mr. BARNETT. How are those laws enacted?

Mr. LYNCH. The general laws and amendments to the by-laws are enacted by conventions, except where they concern the dues of the membership. What constitutional changes and amendments are passed upon by the referendum are enacted in the first place by the convention and then referred to the referendum; or they may be initiated by a certain number of unions and then referred to the referendum; but as a matter of fact there are very few amendments initiated by the local unions; they mainly come from the convention.

Mr. BARNETT. Have the publishers objected to having such laws enacted without some participation on their part in the consideration of those rules?

Mr. LYNCH. The publishers' association under the International Typographical Union law is entitled to be heard by its representative in connection with any law that affects the law of the A. N. P. A. As to whether they object to the laws—I think they do object to them. I think they object to several of the laws, but they take out these arbitration contracts and accept them.

Mr. BARNETT. I do not know whether you happened to be here yesterday and heard the testimony of Mr. Hogan and Mr. Valentine as to the agreement in the Stove Founders' National Defense Association.

Mr. LYNCH. I was not here.

Mr. BARNETT. If I might recapitulate briefly what was said, it was said with reference to that agreement that no rule of the molders' union is binding or considered as binding on the stove foundries unless that rule has been adopted by the national conference, composed of three molders and three founders. Would you regard a system of that kind as preferable to the system now in vogue between the typographical union and the publishers, or would you regard the present system by which working rules can be set by the union alone as a preferable system?

Mr. LYNCH. The working rules are not set by the international union.

Mr. BARNETT. I mean the working rules—these priority laws, and so on?

Mr. LYNCH. The international union agrees to initiate general principles which they feel should apply to the trade, and, as far as my experience goes, before they adopt these general principles they are considered from every viewpoint. Whenever the convention within its powers adopts a general principle it refers it to the referendum and they pass or reject. And I prefer that system, because it gives the workingmen, expressed through this international association, the right, which I think they should have, to initiate these broad general principles which should apply to employment.

Mr. BARNETT. Suppose you explain to the commission the rule of the typographical union with reference to priority.

Mr. LYNCH. We have a system of substitutes, substitutes in a union office who work for other men who hold regular positions when they are off for a day or two, or whatever length of time. They also work for the office when there is extra work to do. Our priority law requires that the oldest substitute on the floor shall be given the first regular situation that he is competent to handle, and that reductions in the force shall be made in the same way; the last man on shall be the first man off, the requirements of the office being taken into consideration.

Mr. BARNETT. Does that rule apply to the local unions pretty thoroughly throughout the United States?

Mr. LYNCH. Yes.

Mr. BARNETT. Is it enforced in such a way as to raise objections on the part of the publishers to-day in places?

Mr. LYNCH. There may be individual objections; but, taking the field as a mass—the North American Continent—the objections have been very few.

Mr. BARNETT. It is regarded by the publishers as a whole as a fair rule, you think?

Mr. LYNCH. I think it is.

Mr. BARNETT. You spoke of the rules with reference to the exchange of matrices; what is that rule at the present time?

Mr. LYNCH. The rule prohibits the use of previous matter; that is, the exchange of local matter or news matter or local advertisements between local newspapers without their being reset within a certain time specified by the local union. Well, not by the local union, but in the local contract agreed to by the publishers as to the time these previously used mats shall be reproduced.

Mr. BARNETT. Is that rule satisfactory to the publishers?

Mr. LYNCH. Some of the publishers object to that rule, but I think they do it more as a matter of having something to object to than they do as a matter of principle. I think a great many publishers are as heartily in favor of that rule as is the union.

Mr. BARNETT. To a layman it may seem rather incomprehensible why they should favor it. Will you explain to the commission why you think so?

Mr. LYNCH. I think it is a matter of self-preservation to a large number of newspapers. Where publishers who control a chain of newspapers would be able to publish those newspapers at greatly decreased cost, and competing at the same time with some local newspaper that would have to pay the full cost, I think perhaps one local newspaper would have gone out of business in a great many instances.

Mr. BARNETT. It is an old rule, is it not?

Mr. LYNCH. It is older than I am.

Mr. BARNETT. As far as you understand the reasons for not abandoning that rule, are they partly a desire on the part of the publishers to keep in existence these papers that otherwise would be driven out of existence? Is that it?

Mr. LYNCH. No; I think that when a condition will arise when it will be possible for the International Typographical Union to make an agreement with the A. N. P. A. under which this rule can be abolished with justice to both there will be very little objection to abolishing it. I think the sentiment is working that way, and our people think they have an interest in the publishing industry, and they want the rule conserved.

Mr. BARNETT. In what way?

Mr. LYNCH. In the same spirit in which the machine was accepted—that it should tend to a reduction in the number of hours of labor in the composing room.

Mr. BARNETT. In other words, in the exchange for the abandonment for this old rule, in existence for many years, the union should receive even in the form of hours or wages or some other amelioration of working conditions some advantage.

Mr. LYNCH. I think they prefer it in the form of hours.

Mr. BARNETT. Do the printers object to the use of nonunion products in any way—type, for example?

Mr. LYNCH. Well, the use of mats and plates of foreign advertisements is permitted, and the use in many instances of mats of news features, syndicate features, is permitted, and the source of the news features is so well known that there is nothing to object to; they are all union mats. I never have heard any objection.

Mr. BARNETT. How about photo-engraved plates, not only in newspapers but elsewhere? Is there any attempt on the part of the Allied Trades Council to require the use of union plates of any kind, or materials of that sort, and refuse to use the products of nonunion photo-engravers?

Mr. LYNCH. The tendency of the Allied Trades Council is toward the use of the union products. There may be instances where they object to the use of photo-engraved plates that are nonunion, and this must be taken into consideration on the sanitary question, that the international unions operating in the printing industry are so thoroughly organized that there is very little of that to object to.

Mr. BARNETT. There is very little nonunion photo-engraved product?

Mr. LYNCH. I think very few.

Mr. BARNETT. Would you regard it as a feasible thing in the printing trade to have a national rate of wages set annually by the Newspaper Publishers' Association and the conferees of the two associations, this rate not necessarily to be a single rate for the entire country, but to be differentiated and agreed on according to the sections of the country?

Mr. LYNCH. You mean on the zone system?

Mr. BARNETT. Something of that sort.

Mr. LYNCH. I don't think it would be practicable.

Mr. BARNETT. Why not?

Mr. LYNCH. Conditions differ very much in different localities. You will find in one city, a small city, for instance, like Muncie, where the wage scale is very high; we will find another city of 30,000 people, like Muncie, where it is not so much, where it is very much lower, and the conditions in that locality must be taken into consideration; and a wage scale that could be borne by a Muncie newspaper with apparent comfort and ease, and who could well afford to pay it and was willing to pay it, could not be borne by another city of 30,000 in the same zone; and that is so of the book and job industry, too.

Mr. BARNETT. So that you do not regard it as likely to come about in the printing trade that there shall be a single national rate set, as in the stove founders' association or the glass trade or the pottery trade, where the rate is set for the United States, or as it practically is in the coal-mining industry? In other words, I want to bring this out: Your system is the only system of collective bargaining that we have heard of in which there is not a national wage rate—the only successful one.

Mr. LYNCH. I do not think it would be practicable to make it national.

Mr. BARNETT. All the other systems of collective bargaining which we have heard about which did not have a national rate, as, for instance, the national founders, have gone to pieces. Yours is the only one of its kind that has endured. Do you regard it as essential or necessary that it should go on in its present form by having these wages settled by the local board?

Mr. LYNCH. I can not understand a condition by which a national wage scale would be possible, except a monopolistic tendency in the control of newspapers and commercial work. If we ever come to a point where a monopoly could control that work, either in Chicago, Pittsburgh, Boston, New York, or San Francisco, or where newspapers issued at a certain point would make it unprofitable to issue local papers—

Mr. BARNETT. I did not mean by a national wage scale the same rate all over the United States. It might be differentiated according to the sections of the country, having a Pacific coast section, or according to the size of the city. You do not think that? You think that in the Middle West, like Indiana, for example, in a State like Indiana you might have two towns of 25,000 people in which the rate of remuneration for apprentices is so different that it would be practically impossible for those rates to be brought up to an equality without deranging the trade?

Mr. LYNCH. It would be practically impossible in making a wage scale in the way you outline it. The tendency would be toward equalization, even in the making of a wage scale locally, as conditions justified that. The wage scale in the second city would gradually approach the wage scale in the first city; and I would not regard it possible to make the wage scale by zones in the way that you indicate.

We made an examination of that and investigated it as well as we could, and reported to the convention against a proposition of that kind.

Mr. BARNETT. Was that printed?

Mr. LYNCH. In the proceedings.

Mr. BARNETT. When was that?

Mr. LYNCH. I think two years ago.

Mr. BARNETT. I will not bother about that. I will get that myself.

Mr. LYNCH. I think you will find it in the Cleveland proceedings.

Mr. BARNETT. Now, about these local rules; that is, the rules of the local union. You say that when the publisher has a contract—takes one of these national contracts—that any rule the local union may adopt which is not simply an interpretation of national rules can be arbitrated under the contract?

Mr. LYNCH. Only the laws that it adopts that affect wages—hours and working conditions. Those are subject to arbitration.

Mr. BARNETT. I did not mean the internal rules of the local unions.

In other words, if the local union adopted an apprenticeship ratio—there is no national apprenticeship ratio in the typographical union, if I remember correctly?

Mr. LYNCH. You are correct.

Mr. BARNETT. If the Baltimore local union, for instance, should adopt an apprenticeship ratio, that apprenticeship ratio would be subject to arbitration?

Mr. LYNCH. Yes, sir.

Mr. BARNETT. And it would not go into force, as I understand it, and could not go into effect until the expiration of any agreement which was already in force; that is, the Baltimore union could not enact an apprenticeship law until 1917 different from what it is now?

Mr. LYNCH. It could enact a new apprenticeship regulation if the local labor contract was about to expire. Then that new apprenticeship ratio would be subject to arbitration if the employers objected to it.

Mr. BARNETT. How long do these local contracts ordinarily stand?

Mr. LYNCH. The popular period is three years. They are made for one, two, three, and five years, but the popular period is three years.

Mr. BARNETT. Has there been any difficulty in enforcing the awards of arbitration boards on publishers? Has there been any difficulty where an award was given by the national board in getting a publisher to carry that out in good faith; has there been any complaint on that score?

Mr. LYNCH. Not any great difficulty. There have been minor difficulties, but the publishers, through their representatives or through their special standing committee, very quickly straightened that out.

Mr. BARNETT. You take that up with Mr. Kellogg?

Mr. LYNCH. We take that up with Mr. Kellogg, and he takes it up with the publisher. If the publisher still refuses to abide by the award, as interpreted by Mr. Kellogg, it is taken up with the special standing committee, of which Mr. Kellogg is a member, and they tell the publisher he has to abide by that award, and he abides by it.

Mr. BARNETT. Has there been any complaint on the part of the publishers that the local union or the typographical union has not acted in accordance with agreements which they have with the publishers?

Mr. LYNCH. Not in 10 years. One of the chief factors of the entire arbitration history of the International Typographical Union has been the opportunity afforded the president of the International Typographical Union and the representative of the publishers to settle these minor disputes as they come up—disputes that formerly caused strikes, starting with some minor thing and growing into a matter of principle, and strikes resulting. There are numberless questions of that kind that are adjusted in Indianapolis by the president of the International Typographical Union and representative of the American Newspaper Publishers' Association. Any question of the union abiding by its local contract or arbitration award, or the publisher abiding by his local contract or arbitration award, will be taken up in that way in the first instance and adjusted—adjusted in ninety-nine cases out of a hundred.

Mr. BARNETT. Does the contract permit unions to go on sympathetic strikes?

Mr. LYNCH. It does not.

Mr. BARNETT. That is absolutely binding?

Mr. LYNCH. The local labor contracts contain clauses providing for sympathetic action if the employer has refused arbitration, the employer who has difficulty with some other union or sister union and has refused arbitration. If arbitration has been refused through the fault of the employer, then the local union is free under its local contracts.

Mr. BARNETT. That is, it inserts that into the national contract?

Mr. LYNCH. Into the labor contract or local contract.

Mr. BARNETT. Has there been any difficulty at times in restraining unions which were anxious to go on sympathetic strikes, but which were forbidden to do so by the agreements which they had with the publishers?

Mr. LYNCH. It all depends upon the definition of the word "difficulty." The fact remains that they have not gone on strike.

Mr. BARNETT. Can you give the commission some idea of the kind of difficulties which may arise, by a typical case?

Mr. LYNCH. The difficulty, if it would be termed such, is in explaining to the local union the nature of the local contentions and its obligations under the contract, and we have never had any difficulty with one of our local unions abiding by its local contracts and its international law when the situation was fully explained. We have that opportunity before the strike occurs.

Mr. BARNETT. Is there any power, or what power of discipline is there in the national union?

Mr. LYNCH. The executive council can deprive the local union of its charter for violation of contract or violation of international law.

Mr. BARNETT. Have you ever taken a charter away from a local union because of violation of contract?

Mr. LYNCH. We have never had occasion to do so. We have had violations of contracts in rare instances, but the local union very quickly reinstated the contract when its attention was called to conditions.

Mr. BARNETT. The national officers have threatened, then, on occasion, to discipline local unions by depriving them of their charter?

Mr. LYNCH. Yes.

Mr. BARNETT. What would be entailed upon a local union in the International Typographical Union by deprivation of its charter? What effect would that have on the men?

Mr. LYNCH. They would lose their continuous membership in the international organization. The process would be that we would immediately organize from within the membership of the defunct union a new union that would abide by the contract.

Mr. BARNETT. I mean with reference to the men.

Mr. LYNCH. The people who were formerly members of the old union would lose their continuous membership in the International Typographical Union and would lose their membership.

Mr. BARNETT. What would that involve?

Mr. LYNCH. Loss of continuous membership would involve mortuary benefits and pension benefits. From the international standpoint it would involve the right of admission to the Union Printers' Home, and, in many instances, from the local standpoint would involve the sick benefits, which would be totally demolished if the local union was destroyed.

Mr. BARNETT. Do you think the discipline of the typographical union has been improved by the institution of these benefits? Do you think that they have been a valuable addition to the functions of the typographical union?

Mr. LYNCH. I think they have been of value in the way of discipline; but I think that the age of the organization, the crises through which it has passed, and the difficulties and obstacles that it has overcome have so educated the membership that there is that feeling of loyalty to the organization that brings compliance with its laws, as has been demonstrated on the occasions when it was necessary to make a stand.

Mr. BARNETT. Do you regard, Mr. Lynch, the method of conciliation—that is, the method of having three or four people on each side settle questions—as a more practical method of settling particular matters than by arbitration, by the bringing in of the odd man?

Mr. LYNCH. If a form of agreement should be evolved that would be workable, I think it would be much preferable. As I explained to you, the present agreement allows a fifth man locally to participate only under certain conditions defined in the contract, and, internationally, the international arbitration board calls in the seventh man only on rare occasions, and then only by unanimous vote of the board.

Mr. BARNETT. Have there been occasions when the international board has called the seventh man?

Mr. LYNCH. There have been two occasions.

Mr. BARNETT. So you would agree in general, then, with the molders that the ideal method of settling a trade dispute is by equal members on each side, if it can be attained, rather than by arbitration?

Mr. LYNCH. I think it is a preferable method. I say that with the reservation that we have not had sufficient experience under this new agreement to know how it will work out, but I think from my knowledge of arbitration, extending over more than a dozen years, it is a preferable method.

Mr. BARNETT. Has the typographical union at the present time any contract with the typothetæ?

Mr. LYNCH. We have no general contract with the typothetæ.

Mr. BARNETT. Did you ever have one?

Mr. LYNCH. We never had a contract during my time with the typothetæ. We did have an agreement with the typothetæ at one time, under which the nine-hour day became effective. That is the only general contract we had, and was with the United Typothetæ of America; that is the only general contract with them that I have any knowledge of.

Mr. BARNETT. That was simply an agreement for a particular purpose?

Mr. LYNCH. For a particular purpose.

Mr. BARNETT. For the purpose of putting into effect a 9-hour day?

Mr. LYNCH. Yes.

Mr. BARNETT. The typothetæ is an organization of book and job publishers?

Mr. LYNCH. An organization; yes.

Mr. BARNETT. What is the other organization?

Mr. LYNCH. The Printers' League of America is one of the organizations, and there was until recently the Ben Franklin Clubs, but I understand the Ben Franklin Clubs are now a part of the United Typothetæ.

Mr. BARNETT. How did your organization deal with the typothetæ and Printers' League, and formerly with the Ben Franklin Clubs?

Mr. LYNCH. We deal with them as between the local unions and the local organizations of master printers.

Mr. BARNETT. In your relations with them, a local union has the power to make an agreement as to what matters?

Mr. LYNCH. As to wages, hours, and working conditions.

Mr. BARNETT. Can the local union in its contract waive rules of the international union?

Mr. LYNCH. Not the international law.

Mr. BARNETT. So the same rule applies in book and job offices as in the publishing departments; that is, that the laws of the International Typographical Union are in force in every union shop? That is, no local union can waive those laws?

Mr. LYNCH. No local union can waive the laws; but the enforcement of the priority law, for instance, is not as general in the book and job offices as it is in the newspaper offices, because conditions are different. The occasion for its enforcement does not arise so frequently.

Mr. BARNETT. Do you remember whether this question of the enforcement of the international law in book and job offices ever came up between your organization and theirs? Has there ever been any provision about that?

Mr. LYNCH. The United Typothetæ some years ago as an organization refused to make an agreement with the International Typographical Union—or you can put it the other way: We refused to make an agreement with the United Typothetæ because we insisted on strictly union offices.

Mr. BARNETT. The particular point was that they objected to having all the workmen members of the union?

Mr. LYNCH. They objected to making a general union contract.

Mr. BARNETT. Did they object to the union foremen, specifically?

Mr. LYNCH. I do not remember that they objected to the union foremen specifically. The general objection was to the union contract, such as we had with the American Newspaper Publishers' Association. At that time the negotiations were broken off, and then a few years afterwards the great 8-hour strike occurred, and at the present time there is a much better feeling between the United Typothetæ of America and the majority of its members, on the one hand, and the International Typographical Union on the other hand.

Mr. BARNETT. What is the rule of the International Typographical Union with reference to foremen?

Mr. LYNCH. That they must be members of the organization.

Mr. BARNETT. Has there been any objection to that on the part of the newspaper publishers?

Mr. LYNCH. There is in some instances. There has been no general objection, which is made largely, I think, for effect in certain cases.

Mr. BARNETT. Are there any reasons for this objection?

Mr. LYNCH. The reasons they advance are that he should be a free agent. We point out that he is a free agent, and the discussion usually ends there.

Mr. BARNETT. Would you personally regard the conciliation of a contract, such as you now have with the Newspaper Publishers' Association, with the United Typothetæ, as desirable? In other words, has the contract of the American Newspaper Publishers' Association worked so well that you would like to see it extended to every branch of the industry?

Mr. LYNCH. Yes, sir; I should be delighted to see a similar contract with the United Typothetæ of America.

Mr. BARNETT. I infer you regard the contract with the American Newspaper Publishers' Association as a distinct success?

Mr. LYNCH. An eminently satisfactory contract, so far as the National Typographical Union is concerned.

Mr. BARNETT. Mr. Chairman, Mr. Lynch desires to leave as promptly as possible, and I have said that I would ask you in his case not to take up more of his time than is absolutely necessary, so that he may leave at the earliest possible moment. Will the commission now ask such questions as they have?

The ACTING CHAIRMAN. Mr. O'Connell, do you desire to ask anything?

Commissioner O'CONNELL. Mr. Lynch, have you time to just answer one question as to your experience with collective bargaining as against individual bargaining?

Mr. LYNCH. The only kind of bargaining we have, Mr. O'Connell, is collective bargaining. There is no such thing in the International Typographical Union as individual bargaining, with possibly the exception of the foremen.

Commissioner O'CONNELL. What I mean to convey is your experience as to the benefit derived by the men in the printing trade.

Mr. LYNCH. Collective bargaining has been in effect in our organization for a number of years, and it has had its growth with the present century, and I regard it as one of the best things we have. It makes conditions stable. There is a definite understanding between employers and composing-room employees as to just what the conditions shall be for a stated period of time.

The ACTING CHAIRMAN. Mr. Weinstock, do you wish to ask anything?

Commissioner WEINSTOCK. Will you please explain, Mr. Lynch, what is the method of procedure if a dispute arises locally between an employer and his union?

Mr. LYNCH. Under an arbitration contract?

Commissioner WEINSTOCK. Yes. As I understand it, there are two separate and distinct bodies with which you deal, the newspaper publishers on the one hand, and the book and bindery people on the other hand.

Mr. LYNCH. The commercial employer on the other hand.

Commissioner WEINSTOCK. That includes what?

Mr. LYNCH. The commercial employer includes any printing office that does book and job work.

Commissioner WEINSTOCK. That is a separate and distinct body from the newspaper men?

Mr. LYNCH. Yes.

Commissioner WEINSTOCK. You have two separate agreements?

Mr. LYNCH. Yes. Even where a newspaper conducts a book and job office as a branch of it, we have two separate contracts with those offices.

Commissioner WEINSTOCK. What happens in a dispute arising in a newspaper office between employer and workmen? What method of procedure is followed?

Mr. LYNCH. Under the arbitration contract they must make an effort to adjust it locally.

Commissioner WEINSTOCK. What machinery is used?

Mr. LYNCH. The officers of the union, and if there is a publishers' association, the officers of that association. In the absence of the publishers' association—and there are numbers of instances where they have no association because they can not always agree—the particular paper that might have difficulty, the proprietor of that paper, or the business manager, will get together and attempt to adjust this difficulty.

Commissioner WEINSTOCK. And failing?

Mr. LYNCH. Failing, they can proceed to local arbitration; but the representatives of the American Newspaper Publishers' Association and of the International Typographical Union handle the matter, except that in disputes arising under contract, they should come direct to the officers at Indianapolis, and if those two representatives are unable to settle it, then go direct to the International Board of Arbitration. We find there is comparatively little difficulty in adjusting a dispute arising under contract. If we can get it to this board of arbitration, as before a board of experts, in a very large number of instances there is no difficulty. My contention, while I was a member of that international board, was that it took only a very short time to secure a unanimous agreement on any dispute arising under a written contract.

Commissioner WEINSTOCK. Is cessation of work meanwhile permissible?

Mr. LYNCH. No; work must be continuous. There can be no strike, and no lockout.

Commissioner WEINSTOCK. If the work is discontinued, the local union then is liable?

Mr. LYNCH. If the work should be discontinued. The work is not discontinued.

Commissioner WEINSTOCK. If it should be discontinued, the local union would be liable to the international?

Mr. LYNCH. If they discontinued that work they would be.

Commissioner WEINSTOCK. Are employers generally friendly or hostile to the unions?

Mr. LYNCH. To unions?

Commissioner WEINSTOCK. Yes. Is the attitude friendly toward the union movement among the newspaper people, or are they hostile to it? Do they accept it as an unavoidable evil, or do they look upon it as a good thing?

Mr. LYNCH. I think in great measure, in a majority of cases, the newspaper publisher looks upon the employment of union labor as a good thing.

Commissioner WEINSTOCK. He would rather have it than not have it?

Mr. LYNCH. Yes.

Commissioner WEINSTOCK. Will the same condition prevail in the commercial printing?

Mr. LYNCH. I think it does, in the instances where the commercial employer is conducting a union office. I think there is no great objection to union labor, if the proposition is systematized. In the commercial branch of the industry, competitive so far as wages are concerned, the industry is on the same basis.

Commissioner WEINSTOCK. All employers start out on an even basis, so far as labor is concerned?

Mr. LYNCH. Yes; so far as labor is concerned.

Commissioner WEINSTOCK. Do the unions object to the bonus system for extra efficiency?

Mr. LYNCH. We do not object to the employer paying the employee any wage he sees fit, above the wage scale.

Commissioner WEINSTOCK. Whether in the form of a bonus, or otherwise?

Mr. LYNCH. If it is a bonus for a stated amount of work, we do not permit it in the typographical union.

Commissioner WEINSTOCK. You do not permit it?

Mr. LYNCH. No, sir.

Commissioner WEINSTOCK. You put a limit on the output of each individual?

Mr. LYNCH. No, sir; we do not put a limit on the output, but we do not permit the payment of a bonus for the setting of so much extra type. A man can set all the type he pleases, and get paid as much as it is worth, but he can not do that in any private contract. His bargaining for his wage is done by his union, and is not a matter between him and the employer as to the certain amount of work he will do.

Commissioner WEINSTOCK. You said the employer could pay more if he chose.

Mr. LYNCH. Pay them all he pleases above the wage scale.

Commissioner WEINSTOCK. But not for additional work?

Mr. LYNCH. He can not make a separate bargain with that man.

Commissioner WEINSTOCK. My reason for asking that is that while I was in Sydney, Australia, talking with a newspaper publisher, he said he offered his men a certain bonus if they could set a certain thousand ems, and that his men generally were very much pleased with it, and some of them made quite a good deal in the way of bonus, and the union came along and forbade it.

Mr. LYNCH. We permit the bonus if it is expressed in the wage scale.

Commissioner WEINSTOCK. If it is made a part of the contract?

Mr. LYNCH. If it is made a part of the contract. Then every man has the same opportunity to be paid the bonus, if he can earn that bonus. We permit that bonus if it is expressed in the contract.

Commissioner WEINSTOCK. You say there is no limit fixed as to the output; that the men are at liberty to earn as much as they can?

Mr. LYNCH. I never knew the limit. I saw where a man set 120,000 the other day, and I think that is pretty near the limit.

Commissioner WEINSTOCK. The charge has been made to me by newspaper employers that the union compels them to employ more pressmen, for example, than actually necessary.

Mr. LYNCH. You will have to ask that question of Mr. Berry, who is president of the International Pressmen and Assistants' Union, and is here to testify.

Commissioner WEINSTOCK. Were you present here yesterday when the molders were testifying?

Mr. LYNCH. No, sir; I was not here yesterday.

Commissioner WEINSTOCK. The molders object, or rather, Mr. Frey, representing the molders, objected to the umpire plan in the settlement of labor disputes. Do your people object to that?

Mr. LYNCH. It seems to me that is a question of the form of the agreement. If it can be safeguarded, if the umpire system can be safeguarded, all well and good. I heard Mr. Cohen this morning say that in the clothing industry there was no objection to lawyers; that lawyers drew that agreement and worked it out; and all that. In our industry we will not permit a lawyer to argue a case nor sit on an arbitration board. So, as I say, it seems to me largely a question of conditions.

Commissioner WEINSTOCK. The representative of the molders' union said that if it was a choice between submitting the matter to an umpire or going on a strike, in his judgment, the strike would be the lesser evil. Would you go to that extreme in the International Typographical Union?

Mr. LYNCH. I have explained the present arbitration contract provides for the fifth man for the local board, and by unanimous vote for the seventh man for the international board.

Commissioner WEINSTOCK. So, while you regard the method of conciliation as the preferred method, you do not object, as a final resort, to the umpire plan?

Mr. LYNCH. We do not object to the fifth and seventh man, if, as I say, the conciliation can be safeguarded in the way we have safeguarded it—that is, the organization does not. It does not object, because it went into this agreement, and it is in effect and provides for that fifth and seventh man. I said I was not convinced it was a good proposition. When the agreement was made we distinctly reserved the right to change that if it did not work out well. The agreement can be changed by the six people representing the two organizations. If this did not work out well, we reserved the right to change it. We tried to find some method that would settle these disputes and settle them satisfactorily.

Commissioner WEINSTOCK. Under the rule, is it allowable for the odd man to be a layman?

Mr. LYNCH. He can be from any walk of life, except a lawyer.

Commissioner WEINSTOCK. I suppose that serves the lawyers right?

Mr. LYNCH. There is nothing expressed in the agreement to that effect, but that is the understanding arrived at, that we should advise against the participation of lawyers in this purely internal arrangement. That was done after an experience in San Francisco, which was rather disastrous.

Commissioner WEINSTOCK. What are the present hours of labor in the typographical union?

Mr. LYNCH. Not more than eight hours in either the newspaper or commercial industry, and in a very large number of instances—the newspaper industry—seven and a half hours, seven, and six, and in one instance in New York four hours a night.

Commissioner WEINSTOCK. The maximum is eight hours?

Mr. LYNCH. The maximum is eight hours.

Commissioner WEINSTOCK. Overtime is allowed?

Mr. LYNCH. Overtime is allowed; yes.

Commissioner WEINSTOCK. At what increased rate?

Mr. LYNCH. It varies. The general rule is price and one-half for a certain number of hours and then double price thereafter; but that is further penalized by the requirement that the member who works more than a certain number of hours per week—if the scale provided for an eight-hour day, more than 48 hours per week—if he works a day, he must employ the first available substitute. The aim is to confine the members as closely as possible to the six-day week. The organization does that.

Commissioner WEINSTOCK. That is, to distribute the work and not to concentrate it?

Mr. LYNCH. It is not so much to distribute the work as it is a health measure. It might also be called a religious measure—"Six days shalt thou labor"—and we have enforced that rule since 1889.

Commissioner COMMONS. There may be members, newspaper publishers, who do not have arbitration agreements with you; that is possible, is it not?

Mr. LYNCH. Yes.

Commissioner COMMONS. About what proportion of their membership do not have agreements?

Mr. LYNCH. Well, under the old agreement there was a very small proportion; I could not tell the exact number. I think the number of arbitration agreements ran up to 275 out of a possible membership of 325. That can be obtained from the report so as to be absolutely reliable.

Commissioner COMMONS. In case a newspaper publisher is not a member of the publishers' association, you may still have agreements with him?

Mr. LYNCH. We may have agreements with them.

Commissioner COMMONS. That would be an individual agreement?

Mr. LYNCH. Yes.

Commissioner COMMONS. Do you make a similar agreement in that case?

Mr. LYNCH. The agreement with the publisher not a member of the A. N. P. A. would be a local contract with the typographical union; and the practical working out of the proposition is this: In a locality where there are five news-

papers and only one holding membership in the A. N. P. A., and they are all joining, as they do, in resisting the wage scale, or the negotiation of a wage scale, and they can not agree locally, the procedure would be under this arbitration contract held by this one newspaper, the other four agreeing to accept the final decision, whatever it may be; so that the result is that the arbitration agreement applies to all the newspapers in that particular town in an adjustment of the wage scale. The intent is that the publisher who is not a member of the A. N. P. A. shall have just as fair treatment as a publisher who is.

Mr. COMMONS. Now, have you any idea what proportion of the daily papers in the country you have contracts with, both in and out of the A. N. P. A.?

Mr. LYNCH. Daily newspapers published in towns and cities in which we have typographical unions—I should say we had agreements with at least 90 per cent, if not more than that; there are very few nonunion newspapers, so far as typographical unions are concerned.

Commissioner COMMONS. Dailies?

Mr. LYNCH. Dailies.

Commissioner COMMONS. How would you figure it out for weeklies?

Mr. LYNCH. The weeklies published in large centers are generally published by commercial offices which are to a large extent union; and these weeklies printed in towns and hamlets where there are not enough printers to form a union may be printed by members of the International Typographical Union and may be printed by nonmembers.

Commissioner COMMONS. But you do not class them as commercial offices. Now, can you figure out what you call the commercial, which, I take it, is the book and job offices of the country; do you figure out what proportion of them you have agreements with?

Mr. LYNCH. That would be largely guesswork; but we have either written or verbal agreements. In the verbal agreements, for instance, the proprietor says, "We will pay that scale; that scale is all right, and we will pay it for one or two or three years," but he does not enter into a written contract; and we have verbal or written agreements with the great majority of the book and job concerns throughout the country.

Commissioner COMMONS. In that case they do not accept that international law?

Mr. LYNCH. With reference to making contracts?

Commissioner COMMONS. Yes.

Mr. LYNCH. Oh, yes; they do—verbal contracts.

Commissioner COMMONS. What, for example, would be done in a verbal contract? It just relates to wages and hours, and then these rules about the closed shops, and apprentices, exchange plates, and priority?

Mr. LYNCH. They accept them all; they conduct either a union office or a nonunion office, so far as the typographical union is concerned.

Commissioner COMMONS. But you make no agreement with them unless it is a union office?

Mr. LYNCH. You could not make an agreement with them unless it is a union office; we make an agreement with a previously nonunion office that in a reasonable time it shall become a union office.

Commissioner COMMONS. And there is no agreement except it becomes a union office?

Mr. LYNCH. That is part of the international policy.

Commissioner COMMONS. That carries with it these other international rules?

Mr. LYNCH. It carries with it the observance of international law.

Commissioner COMMONS. Can these laws be changed between agreements?

Mr. LYNCH. No. The international law of the date on which the contract is made applies for the term of that agreement; they know the conditions beforehand, the conditions that apply.

Commissioner COMMONS. The commercial offices probably have a wider range of competition than the daily newspapers. Its competitors are only in the same locality; that is usually the case, is it not?

Mr. LYNCH. Yes.

Commissioner COMMONS. Where books can be printed?

Mr. LYNCH. Yes.

Commissioner COMMONS. So that this difference in the wage rate in different localities is a material thing with a commercial house more than it is with the daily newspapers?

Mr. LYNCH. The difference in wage rates as between specified localities and its effect on the work; I presume that is what you have in mind.

Commissioner COMMONS. Yes.

Mr. LYNCH. It has always seemed to me to be one of equipment for a particular kind of work rather than the difference in the wage scale, which would be slight, would not be so great; but I have known of New York proprietors to go up into Poughkeepsie and take Poughkeepsie work out of Poughkeepsie, and I have known Poughkeepsie proprietors to come to New York and take work out of that city. That question of competition is a complex one in the newspaper business.

The Denver proprietors, with a high wage scale, take work out of Chicago, at a higher wage scale, and so it goes; and Chicago may take work out of San Francisco. I have known that to happen, and with San Francisco working under a higher wage scale; so that in the end it seems to me largely a question of equipment for a certain class of work which one office may produce very much cheaper than another office can produce the same job.

Commissioner COMMONS. That class of work is centralized in a few large offices?

Mr. LYNCH. Not a few large offices, because there are a large number of large offices—large offices scattered all across the continent. There is a large office in Hammond, Ind., which is not a large place as large places go. There are large offices in comparatively small towns; one at Garden City, conducted by Doubleday, Page & Co. Garden City is not a large place. And there is a very large office in Denver, and it is capable of doing any kind of work there is in Chicago; so these large offices are scattered all over the continent.

Commissioner COMMONS. If some of these offices are subject to union rules, would they not be at a disadvantage in comparison with similarly equipped offices not subject to union rules?

Mr. LYNCH. From my experience, I do not believe that is the situation. I believe that a union office has an advantage over a nonunion office, as a general rule, as to labor market, standardization, the character of its employees, and the skill of its employees, and in many other ways; and we have in the case of newspapers that have changed from nonunion to union offices—here we have been permitted to make an investigation—it has been demonstrated, and subsequent figures have borne out our investigation, that the union office produces a newspaper cheaper than a nonunion office.

Commissioner COMMONS. Would the preferential shop, as was described to you this morning, in a commercial office—not speaking of a newspaper office—would that seem to you a practical proposition?

Mr. LYNCH. If I were president of the International Typographical Union and Mr. Finlay offered to make a contract with me on that preferential basis I would make it very quickly, because I know that it would be very quickly a strictly union office. I make that statement with my understanding of the preferential office as described here this morning by the people interested in that preferential office.

Commissioner COMMONS. And you consider the Chicago system of Hart, Schaffner & Marx quite the same as in New York?

Mr. LYNCH. There seemed to be a difference in the Chicago system, very different in the thorough understanding that Mr. Cohen had of the New York situation and the other gentleman had of the Chicago situation, but I am talking particularly of the New York situation; the Chicago situation is not clear to me on that statement of those autonomous unions that work in Hart, Schaffner & Marx's shop. They are unions that I never heard of before, autonomous local unions.

Commissioner COMMONS. In general, you want to have the agreement made with the international?

Mr. LYNCH. Such an agreement could be made or might be made by our local union, but if I had to make such an agreement with the United Typothetae I would want to make it with their international organization, because then I would know that the agreement would be carried out.

Commissioner COMMONS. In such case would you think it feasible to arbitrate either the rules of the international law or the rules that might be proposed by local unions and submit them also to arbitration, as seems to be the case in the protocol system, everything is arbitrable, and as seems to be the case in the stove industry?

Mr. LYNCH. I do not think any association employers in the printing industry, that I know of anyway, would consent to arbitrate the proposition as to whether an office should be a union or a nonunion office, union or interna-

tional union, they would not consent, and I do not think any of the others in the industry would consent.

Commissioner COMMONS. I should exclude that, because when you say preferential shop that would exclude it, but as to these other rules, apprenticeship, exchange of plates, and priority, the six-day rule.

Mr. LYNCH. I do not think there would be any necessity of arbitrating them. I do not think any association employer has any objection to those rules.

Commissioner COMMONS. And that is the thing you would consider if you were going to consider also a preferential shop; you could logically consider those?

Mr. LYNCH. That was not the kind of preferential shop that was described this morning, unless I misunderstood the witnesses. My understanding of it was a shop that employed union men in preference to nonunion, and when the work was slack they laid off the nonunion man instead of the union man.

Commissioner O'CONNELL. And when they took them back they took back the union men first?

Mr. LYNCH. They took back the union men first; I do not think under that condition the international union would get much the worst of it, nor do I think anybody in the international union would get much the worst of it.

Commissioner WEINSTOCK. Do the employers make separate contracts as to each department or is there one contract that covers all departments in a printing establishment?

Mr. LYNCH. As a general rule the proprietors make separate contracts with the unions operating in the establishment, but there are instances in which what we call blanket contracts are made, covering all the unions operating in that establishment.

Commissioner WEINSTOCK. Is a union man permitted to work for what would be called an unfair employer?

Mr. LYNCH. What would be your definition of an unfair employer?

Commissioner WEINSTOCK. An employer that had been turned down by organized labor as being unfair for all sorts of reasons.

Mr. LYNCH. If we have contracts with an employer, we fulfill those contracts, of course. I do not just understand your question.

Commissioner WEINSTOCK. Let me give a concrete case. In my own city, San Francisco, there is a strike on there now—at least there was when I left there. It had been running for months—between the pressmen and the commercial employers. Yet all the men employed in all the other departments have remained on the job. The local labor council has declared a boycott on those employers because they could not come to an understanding with their pressmen. Therefore they are unfair employers from the union standpoint, and yet these other men continued at work.

Mr. LYNCH. The International Typographical Union, and I think that is true of all the other unions, do not permit the local labor council or any other body to interfere with its contracts or with its control over conditions that shall obtain in the composing room or as to whether the members shall or shall not work in those composing rooms. The International Typographical Union has complete jurisdiction so far as the union is concerned over the composing room.

Commissioner WEINSTOCK. And yet in the year of the panic at San Francisco these printing establishments which are having trouble with their pressmen are looked upon as having been declared unfair.

Mr. LYNCH. One of the things that the International Typographical Union and the other four unions of the printing industry were attempting to work out when I severed my connection with it as president was a general agreement under which the unions could act together in cases of the kind you describe. I have no knowledge of the condition that agreement is in. One of the last things I did was to draft that agreement, and we considered it at one conference in Indianapolis; then the conference adjourned, and when it met again I was not president of it, so that I do not know what condition it is in.

Commissioner WEINSTOCK. But the idea is to federate the unions so that they would act together?

Mr. LYNCH. To create a course of conduct in the event of trouble in any mechanical department.

Commissioner WEINSTOCK. That matter is still undetermined?

Mr. LYNCH. It is still in charge of officers of the international; but I am not an officer of the international union now.

The ACTING CHAIRMAN. I think that is all, Mr. Lynch. Thank you.

TESTIMONY OF MR. ALBERT W. FINLAY.

Mr. BARNETT. What is your residence?

Mr. FINLAY. Boston, Mass.

Mr. BARNETT. Will you state your official connection with the United Typothetæ of America?

Mr. FINLAY. Chairman of the executive committee of the United Typothetæ of America, and the Franklin Clubs of America.

Mr. BARNETT. How long have you been connected as a member or in an official position with the United Typothetæ?

Mr. FINLAY. Our firm has been a member since the typothetæ was organized. Mr. Ellis, my partner, was president of it for some years, so that we have had active membership in it since it was organized.

Commissioner WEINSTOCK. That represents the employers?

Mr. FINLAY. Yes.

Commissioner WEINSTOCK. What are called the commercial employers?

Mr. FINLAY. Yes; but it does have members who run papers.

Mr. BARNETT. How many local associations make up a department?

Mr. FINLAY. I could not tell you. We have a membership of 1,958 firms.

Mr. BARNETT. Is the membership pretty well distributed over the United States, or is it stronger in some parts?

Mr. FINLAY. It is pretty well distributed in the United States, outside of California; we have no membership in San Francisco.

Mr. BARNETT. What was the character of the Ben Franklin Clubs which were amalgamated with the typothetæ?

Mr. FINLAY. They took in the smaller printers, where the minimum due was 50 cents a month; and it was largely an educational organization, to educate the printer in ascertaining the cost of his product.

Mr. BARNETT. The typothetæ was organized, you said when, 1889?

Mr. FINLAY. No. We had our twenty-seventh convention at New Orleans in October.

Mr. BARNETT. That would make it 1886?

Mr. FINLAY. Yes.

Mr. BARNETT. What were the purposes in the organization at that time?

Mr. FINLAY. It was first organized, I think, to resist the nine-hour day.

Mr. BARNETT. The nine-hour day, in what trade?

Mr. FINLAY. In the book-and-job branch.

Mr. BARNETT. In which one of the mechanical trades; in all?

Mr. FINLAY. The composing room was where the demand came from.

Mr. BARNETT. What part of the employees of the typothetæ, relatively, are printers and pressmen? In other words, do the members of the typothetæ employ more pressmen or more printers?

Mr. FINLAY. You mean the compositors?

Mr. BARNETT. Yes.

Mr. FINLAY. That would depend upon the plant; they would employ both.

Mr. BARNETT. I know you do; but, relatively, in large jobbing printing plants, is there not some established proportion between them? Do they employ more printers or pressmen?

Mr. FINLAY. I think we employ more compositors.

Mr. BARNETT. More compositors?

Mr. FINLAY. Through the membership I should think so; yes.

Mr. BARNETT. Has the typothetæ power to make agreements for its members?

Mr. FINLAY. Only locally.

Mr. BARNETT. The United Typothetæ has no power to bind the local organizations?

Mr. FINLAY. Only that the kind of contract entered into shall be submitted to the executive officers for inspection.

Commissioner COMMONS. That is the local contract?

Mr. FINLAY. Yes. You can make no national contracts.

Commissioner WEINSTOCK. You mean a local contract is made subject to the approval of the executive officers nationally?

Mr. FINLAY. Not subject to the approval. It has got to be submitted there; that is one of the requirements.

Commissioner WEINSTOCK. What is the purpose of submitting it unless it is to be approved?

Mr. FINLAY. It might conflict with or jeopardize some locality that had a contract that would be right in close connection with that.

Mr. BARNETT. At the present time does the United Typothetæ have contracts with any trade-unions?

Mr. FINLAY. The United Typothetæ?

Mr. BARNETT. Yes.

Mr. FINLAY. No.

Mr. BARNETT. It has no contract with any trade-union?

Mr. FINLAY. No.

Mr. BARNETT. Does it participate in trade-union relations of its members, the labor relations, at all? Does it assist its members in time of strike, for example?

Mr. FINLAY. It will assist its members, any of its members in time of trouble, to conduct their business in any way they see fit.

Mr. BARNETT. Were you here at the examination of the National Founders' Association yesterday, and did you hear Mr. Briggs?

Mr. FINLAY. I only heard him in rebuttal.

Mr. BARNETT. I thought you might have heard him describe the methods in times of strike of assisting members. Is there any method of assisting members in time of strike?

Mr. FINLAY. No.

Mr. BARNETT. The particular methods of treatment of the struck member would be determined for that particular case by the executive committee?

Mr. FINLAY. Yes.

Mr. BARNETT. Would the executive committee pay the member in certain cases damages?

Mr. FINLAY. It has no funds to do it with.

Mr. BARNETT. Would it assist him with workmen?

Mr. FINLAY. It would give him moral support and assist him with workmen if they could get them for him.

Mr. BARNETT. Would it only give him moral support, or would it spend money?

Mr. FINLAY. It has no funds.

Mr. BARNETT. The United Typothetæ has no funds?

Mr. FINLAY. Not for that purpose.

Mr. BARNETT. So that the only support it gives its members in times of strike is moral support and the sympathy of the other members?

Mr. FINLAY. Yes.

Mr. BARNETT. The United Typothetæ formerly had agreements with trade-unions?

Mr. FINLAY. With the pressmen's union.

Mr. BARNETT. And also with the compositors you had an agreement with reference to the introduction of the nine-hour day.

Mr. FINLAY. Yes.

Mr. BARNETT. When was the agreement with the pressmen's union made?

Mr. FINLAY. In 1902.

Mr. BARNETT. What was the character of that agreement? What were the chief features?

Mr. FINLAY. We consider the open-shop agreement, whoever we hire we will pay him the same scale of wages, regardless of his union or nonunion affiliations. That agreement was entered into in 1902.

Mr. BARNETT. How were the differences arising under the agreement to be determined?

Mr. FINLAY. By conference.

Mr. BARNETT. Suppose there is a local condition?

Mr. FINLAY. That is provided for, and if they could not settle it locally it was decided by the national board of arbitration.

Mr. BARNETT. How was that constituted?

Mr. FINLAY. Two members from the typothetæ and two members from the union, and if they could not agree they selected a fifth man, who was the umpire, you might say, or the boss.

Mr. BARNETT. What kind of questions were to be submitted?

Mr. FINLAY. Only the questions of shop practice. This is a very short agreement, if you want to read it.

Mr. BARNETT. We shall be very much obliged if you will file a copy with the commission.

Mr. FINLAY. This agreement reads as follows:

"THE AGREEMENT BETWEEN THE UNITED TYPOTHETÆ OF AMERICA AND THE INTERNATIONAL PRINTING PRESSMEN AND ASSISTANTS' UNION OF NORTH AMERICA.

"This agreement, made and entered into this eighth day of January, 1907, by and between the United Typothetæ of America and the International Printing Pressmen and Assistants' Union of North America, for the purpose of establishing between the employing printers of the United States and their pressmen and feeders uniform shop practices and fair scales of wages, settlement of all questions arising between them, and the abolition of strikes, sympathetic or otherwise, lockouts and boycotts:

"Witnesseth, That any question arising between a local typothetæ or affiliated association of employers and their pressmen or feeders in regard to wages or shop practices shall be referred in writing to the local conference committee, made up equally of representatives from the local typothetæ and the local union. During such conference, and until final settlement of the question, the conditions obtaining at the time of the notice shall continue, and in the meantime there shall be no lockout and the men shall remain at work. Should either party, after such notice, consider itself further aggrieved, such party shall immediately present a written protest of such condition to an officer of the other party, which grievance shall be acted upon by the conference committee within five days. Neither party shall have the right, under any circumstances, to decide that the other party has broken the contract, but such decision shall remain only with the conference committee. Should this committee be unable to agree, or should one of the parties consider itself aggrieved by said committee's findings, either party to the conference may refer the question at issue to the national conference committee, which national conference committee shall act as hereinafter set forth.

"Both local and national conference committees, in settling questions of shop practice, shall aim at the establishment of uniform shop practice throughout the United States and Canada. Unless special contracts to the contrary exist, any finding of the national committee in regard to shop practice shall be binding upon local organizations.

"A ruling upon a question of shop practice shall be made within three months after the presentation of such question to the conference committee of either side, and such ruling, when once established by said committee, shall not be reconsidered within two years.

"Any change in the scale of wages shall be settled by conference or arbitration within four months after the first request for consideration, but shall not go into effect until one year after the first request for consideration, and no scale of wages shall be changed oftener than once in three years: *Provided, however*, That all such scales of wages shall terminate with the expiration of this contract, unless specifically agreed to the contrary.

"All present contracts between the local typothetæ or affiliated organizations of employers and their pressmen and feeders shall continue in force until their natural expiration.

"A contract accepting a particular scale of wages does not include the acceptance of any rule of the union in regard to shop practice not specially mentioned in said contract.

"The International Printing Pressmen and Assistants' Union shall not engage in any strike, sympathetic or otherwise, or boycott, unless the employer fails to live up to this contract, it being understood that the employer fulfills all the terms of this contract by paying the scale of wages and living up to the shop practices as settled by the committee, regardless of his employee's union affiliations; no employer shall engage in any lockout unless the union or members thereof fail to live up to this contract, the conference or arbitration committee to be the final judge of what constitutes a failure to live up to this contract.

"Pending investigation or arbitration, the men shall remain at work. The conference committee shall fix the date when any decision shall take effect, except the question of wages, which is heretofore provided for.

"In the event of either party to the dispute refusing to accept and comply with the decision of the national board of arbitration, all aid and support to the firm or employer or local union so refusing acceptance and compliance shall be withdrawn by both parties to this agreement. The acts of such recalcitrant employer or union shall be publicly disavowed, and the aggrieved party to this

agreement shall be furnished by the other with an official document to that effect.

"In the event of a strike in a nontypothetæ office, if it proven to the local conference committee that such office is not complying with the shop rules and practices and scale of wages in accordance with the terms of this contract, no assistance shall be given to such office by typhotetæ members.

"This agreement shall continue in full force and effect until May 1, 1912.

"It is expressly agreed that until January 1, 1909, fifty-four hours shall constitute a week's work; and that thereafter during the life of this contract forty-eight hours of eight hours a day shall constitute a week's work; arrangements, however, can be made locally to bring the forty-eight hours so that a Saturday half holiday can be enjoyed without overtime cost to the employer, it being distinctly understood that the employer is entitled to the forty-eight hour week, fifty-two weeks in the year, except where legal holidays intervene.

"Notice of any desired changes in the contract must be given in writing by either party to the contract at least one year prior to the expiration thereof.

"Manner of arbitration: Each party to this contract shall appoint two of its members who shall be known as its members of the national board of conference and arbitration. These members may be changed at the will of the respective parties except during the negotiation of any particular question, during which time the membership of such board shall continue the same. In case of the death of any member of such board during the consideration of a question, the place of such deceased member shall be filled by his party and the entire proceeding shall thereupon begin again. This board shall meet upon a request of the president or presiding officer of either party at some point to be mutually agreed upon within one month of such request and shall take such evidence as it may consider bears upon the subject in hand. A majority of votes cast upon any question shall be binding upon both parties to this agreement. Should the vote upon any question result in a tie, this board shall select a fifth person to act as arbitrator, who shall for this particular question act as a member of such board, and the decision of such constituted board shall be binding upon the parties thereto.

"The expenses of the members of the conference committee shall be borne by their respective parties. The common expenses of a conference shall be equally divided between the two parties."

This was negotiated in 1903.

Mr. BARNETT. As we understand that it provided for the submission to these local boards and to the national board of all shop practices—that is, such things as apprenticeships, and the number of men on each press, and so forth.

Mr. FINLAY. That could be brought up.

Mr. BARNETT. It differed then from the contract which Mr. Lynch has described with the A. N. P. A. in that the international laws were not reserved from the adjudication of these tribunals, did it not?

Mr. FINLAY. It was not stated that there was anything in the international laws—

Mr. BARNETT. Reserved?

Mr. FINLAY. Reserved.

Mr. BARNETT. What was the understanding of your members as to the provision as to the open shop, or the provision as to the kind of shop, in the agreement; will you read the words again?

Mr. FINLAY. It says that a man lives up to the agreement as long as he pays the scale of wages, regardless of whether the man has union or nonunion affiliations.

Mr. BARNETT. Your understanding is that under that clause the employer could employ anyone he saw fit; that was the interpretation?

Mr. FINLAY. So long as he paid the scale of wages.

Commissioner WEINSTOCK. Is this agreement in operation now?

Mr. FINLAY. No.

Commissioner WEINSTOCK. It is the old agreement?

Mr. FINLAY. Well, it was renewed.

Mr. BARNETT. Could you tell the commission how many cases were settled under this?

Mr. FINLAY. No cases were ever settled.

Mr. BARNETT. No wage scale was ever settled?

Mr. FINLAY. Not that I know of.

Mr. BARNETT. No local arbitration board was ever formed?

Mr. FINLAY. I don't know of any.

Mr. BARNETT. How long was the agreement in force?

Mr. FINLAY. It was in force one year, when they violated the agreement.

Mr. BARNETT. One year only?

Mr. FINLAY. Yes.

Mr. BARNETT. Was there not discussion in 1910 with reference to a renewal of the agreement?

Mr. FINLAY. Yes; there was another agreement that was a renewal.

Mr. BARNETT. How was the agreement violated at the end of the first year?

Mr. FINLAY. I am sorry Mr. Lynch is not in the room when I make this statement; I told him I was going to make it, and I wish he was present.

That agreement was violated by the pressmen's union through the International Typographical Union locally in Boston. I want to exonerate the officers of the International Typographical Union from having any hand in the thing at all or in dealing with it. It was purely a local matter.

Mr. BARNETT. And after that no effort was made to work the agreement anywhere?

Mr. FINLAY. Well, we had a strike, and that provides for no strikes.

Mr. BARNETT. A strike in Boston?

Mr. FINLAY. Yes.

Mr. BARNETT. What was done?

Mr. FINLAY. In 1904 the typographical union made a demand upon the Typothetae officers for a new scale. We had agreements with them; in that scale was contained a clause for eight hours a day, and we told them we could not receive the communication as our organization had a contract with the pressmen's union running for 54 hours, and that they must eliminate that or we could not consider the scale. We broke on that point. We did not receive the scale. The local union in Boston went out on a strike, and they forged a telegram in Mr. Lynch's name authorizing a strike. We enjoined them from paying strike benefits to anybody but their own members, through Mr. Brandeis. Our pressmen and feeders went out. Mr. Higgins was president of the pressmen's union at that time and residing in Boston. We took the matter up with him and he told us that it was nothing he had anything to do with, that they had not ordered any strike, and that the men went out as individuals, and that there was nothing to arbitrate. As a matter of fact, which Mr. Lynch would bear me out in, after being enjoined from paying any strike benefits to anybody but their own members, and after we settled with Mr. Lynch when he was brought into it, Mr. Brandeis sent to me and produced a letter signed by Mr. McMullen, who was president of the Boston Typographical Union, and J. Henry Davis, who was secretary, and was a member of our school board, where they had given our employees a written statement that if they would go out and go on strike they would pay them their strike benefits while the strike lasted. That came into Mr. Brandeis's hands because they did not live up to their agreement and they wanted to get some money for Mr. Brandeis for the evidence.

Mr. BARNETT. Did that terminate all relations under the agreement?

Mr. FINLAY. No, we went along; it was put up to us that way, that these men went out as individuals, and that they had a right to quit work as individuals, and when we had our Buffalo convention we had Mr. Higgins address us and we had him prepare an agreement for an eight-hour day.

Mr. BARNETT. When was that?

Mr. FINLAY. In 1907.

Mr. BARNETT. I should like to get at just what happened between the Boston strike of 1907—you say there were no cases settled under this agreement—you mean that although it was in existence that nowhere in the country were any local cases or shop practices settled?

Mr. FINLAY. No.

Mr. BARNETT. What was the point in having it?

Mr. FINLAY. It was supposed to carry on industrial peace, and while it is peculiar that there were no arbitrations, the employers seemed to put up with anything in the way of shop practices, and the employees did not do anything; each one was afraid that they would lose some advantage they had, and they let it go, because it would have to be established that shop practices had been changed after that contract was negotiated, because they accepted the practices of the shop as they were when it was negotiated.

Mr. BARNETT. And future shop practices.

Mr. FINLAY. They were to be changed, but there was nothing to arbitrate.

Mr. BARNETT. How were the wages settled during that period, locally?

Mr. FINLAY. In Boston we had agreements, always had agreements with them; we have agreements now.

Mr. BARNETT. This agreement for arbitration was not brought into force because there were no local disagreements?

Mr. FINLAY. No local shop practices that we considered were violated.

Mr. BARNETT. How about wages?

Mr. FINLAY. That was a matter of local negotiation? It says there that they pay the scale of wages to union and nonunion, and that was a fulfillment of the agreement.

Mr. BARNETT. Don't you understand that this agreement provided that if the local union and the employer could not agree on wages it could be taken up by the national board?

Mr. FINLAY. I didn't so understand it. It says when they pay the wages—

Mr. BARNETT. Now, there was a termination of the contract, and the contract was renewed in 1907; were there any changes made in the contract at that time?

Mr. FINLAY. There was a change made for a nine-hour day January 1, 1909.

Mr. BARNETT. Were there any other changes made in the contract?

Mr. FINLAY. Essentially none.

Mr. BARNETT. How long did the agreement exist after that; how long was it in force?

Mr. FINLAY. Well, shortly after that second agreement which we had a special convention in Pittsburgh for and ratified, Mr. Higgins, who was president of the union was removed—well, he was not reelected, he was not re-elected—and Mr. Berry, who is here in the room, was elected, and we had him arrested down in Ohio for violation of the contract, and the decision is in this book.

Mr. BARNETT. How did the decision come out?

Mr. FINLAY. He was enjoined in the court down in Ohio by A. C. Thompson, judge, the southern district of Ohio, western division.

Mr. BARNETT. Did the injunction come before the courts at all?

Mr. FINLAY. The injunction came before the court; yes.

Mr. BARNETT. What was the result?

Mr. FINLAY. I have it here. It is as follows:

“In the Circuit Court of the United States, Southern District of Ohio, Western Division. In equity. No. 6295.

“A. R. Barnes & Co., etc., et al., complainants, v. George L. Berry and Patrick J. McMullen, defendants.

“ORDER.

“This cause coming on to be heard on motion of A. R. Barnes & Co., etc., et al., complainants herein, for a temporary injunction on behalf of the complainants and all members of the United Typotheta of America, who are not citizens of Ohio, restraining the defendants, their agents, and confederates, and each of them, and all persons now or hereafter aiding or abetting, combining, or confederating with them, or any of them, from further committing the acts charged in the bill of complaint filed in this cause, and it appearing to the court from the allegations in the said bill and from affidavits filed in this cause, that there is reason to believe that said defendants have been guilty of the acts set forth in said bill and affidavits, and have conspired and are conspiring, as charged therein, and due notice of this motion having been given, and the defendants, Berry and McMullen, being represented in court by counsel, and the court being advised in the premises, it is therefore ordered that the said defendants, George L. Berry and Patrick J. McMullen, their agents and confederates, and each of them, and all persons now or hereafter aiding or abetting, combining, or confederating with them, or any of them, be, and they are hereby, restrained until the further order of the court.

“From calling or instituting strikes, or advising, aiding, and assisting in the calling or instituting of any strike against the business of the said members of said typotheta, or any of them, for their refusal or the refusal of any of them to institute the ‘eight-hour day’ in their respective businesses prior to January 1, 1909, or the ‘closed shop’ in their respective businesses at any time;

“From instituting and maintaining, or encouraging the members or any member of the said union and its subordinate branches and locals to institute

or maintain strikes against the business of any of the said members of said typhotetæ for refusal or failure on the part of any such member to institute the 'eight-hour day' in said members' business prior to January 1, 1909, or the 'closed shop' in said business at any time;

"From in any manner interfering with, hindering, obstructing, or stopping the business of the said members of said typhotetæ, or any of them, for failure or refusal on the part of any of them to institute or maintain the 'eight-hour day' in their respective businesses at any time prior to January 1, 1909, or the 'closed shop' in their respective businesses at any time."

Mr. BARNETT. We will not trouble you to read anything further, Mr. Finlay. It follows the usual form of labor injunctions. We will be glad if you will file this with the commission.

Mr. FINLAY. Yes, sir; certainly.

(The book referred to in the testimony of Mr. Finlay and from which the foregoing extracts were read, was filed with the commission and marked "Finlay Exhibit 1, April 8, 1914.")

Mr. BARNETT. Were there any proceedings under this? This was a preliminary injunction. Was it carried any further?

Mr. FINLAY. No; I do not think it was.

Mr. BARNETT. Was the injunction made permanent?

Mr. FINLAY. I could not say that.

Mr. BARNETT. Perhaps Mr. Berry can tell?

Mr. FINLAY. He can tell you.

Mr. BARNETT. Was there any contention on the part of the union as to this contract, as to the meaning of this contract; do you know?

Mr. FINLAY. No; not that I know of.

Mr. BARNETT. On what ground did the union violate it, or what reason did they offer for violating it?

Mr. FINLAY. They wanted an eight-hour day previous to the contract.

Mr. BARNETT. Did they maintain the contract was not entered into by the union?

Mr. FINLAY. No.

Mr. BARNETT. They did not maintain it was not a rightful contract?

Mr. FINLAY. No; we had a general strike in 1906 with the International Typographical Union for an eight-hour day, and it was going on at that time.

Mr. BARNETT. I judge from what you say that you feel that through these means what might have been the beneficent effects of the agreement were prevented through the fact that the union would not keep its agreement.

Mr. FINLAY. We assumed that when the men went out in a body they went on a strike. We found out afterwards they went out as individuals.

Mr. BARNETT. You also assumed that when you made a contract in 1907 it would be lived up to?

Mr. FINLAY. Yes.

Mr. BARNETT. And in both of those expectations you were disappointed?

Mr. FINLAY. Yes.

Mr. BARNETT. You have no contractual agreement with the International Typographical Union?

Mr. FINLAY. No.

Mr. BARNETT. Why have you not entered into contractual relations with the typographical union?

Mr. FINLAY. Locally we have not because in 1904 we had this unfortunate affair and negotiations broke off at that time. We have always taken this position, that we will always meet the body of employees, whether they are employees of an individual shop or their representatives through their organization—their union. We have had several meetings with Mr. Brady, who represents the national organization in New England, within the last three or four months, seeing if there can be something done to renew contractual relations.

Mr. BARNETT. Would you regard a contract such as that which Mr. Lynch described as existing at the present time between his organization and the American Newspaper Publishers' Association as a desirable form of contract between the United Typhotetæ and the International Typographical Union?

Mr. FINLAY. No.

Mr. BARNETT. Why not?

Mr. FINLAY. Because all our members do not run union shops, and you have to have union shops to have that contract.

Mr. BARNETT. Part of your members do run union shops?

Mr. FINLAY. Some of them. They can run union shops or open shops.

Mr. BARNETT. In the negotiations with the International Typographical Union for a national agreement, has the question of an open shop or a closed shop been the chief difficulty in the way of reaching some kind of a national agreement?

Mr. FINLAY. That agreement which we negotiated with the pressmen in 1903 was offered to Mr. Lynch and his executive board, but they would not accept it. They wanted the closed shop.

Mr. BARNETT. So that you feel the chief difficulty in the way between you and having a national agreement with the International Typographical Union is the question of the closed shop?

Mr. FINLAY. We could not deliver our members.

Mr. BARNETT. You understand the American Newspaper Publishers' Association does not sign up for all its members. Any member of the newspaper association who sees fit to take advantage of a contract can do it, but there are many members of a newspaper association who do not run nonunion shops.

Mr. FINLAY. But they do not get any protection.

Mr. BARNETT. No; they do not get any protection. But the point is, would it, in your opinion, be worth while for the United Typothetæ to make a contract which could be accepted by any of its members who at the present run union shops which is a form of contract?

Mr. FINLAY. That could only be done very recently. At our Denver convention we admitted to our membership members of labor organizations who were not officers of unions. When we had this conflict the people that ran open shops resigned from our organization to conduct shops on an eight-hour basis under an agreement with the typographical union.

Mr. BARNETT. In general, then, do you favor the establishment of trade agreements between employers and employees?

Mr. FINLAY. Locally, I believe in them; yes.

Mr. BARNETT. You do not regard a national agreement at the present time as feasible in your trade?

Mr. FINLAY. AS Mr. Lynch said, it is pretty hard, on account of the different localities, to have a wage scale. For instance, in Boston we have a scale of \$21 a week, and in Worcester, an hour's ride from there, we have a scale of \$16 a week. You can imagine the Worcester people would not be very enthusiastic over having a scale with the International Typographical Union that would pay them \$5 a week more. It might be a good thing for us.

Mr. BARNETT. In the American Newspaper Publishers' Association they could not have a uniform scale?

Mr. FINLAY. They do in localities.

Mr. BARNETT. They do in a particular locality?

Mr. FINLAY. We would call Worcester a zone.

Mr. BARNETT. They only have a city as their locality or their unit?

Mr. FINLAY. Yes.

Mr. BARNETT. If the commission will ask such questions as they desire now, I shall be very glad, as Mr. Finlay desires to leave.

The ACTING CHAIRMAN. Mr. O'Connell, do you desire to ask anything?

Commissioner O'CONNELL. Have the typothetæ organized their members in your city or in any city into a local organization?

Mr. FINLAY. If they have five members, they have to have a local.

Commissioner O'CONNELL. Have you a local in Washington?

Mr. FINLAY. Yes.

Commissioner O'CONNELL. If I were to ask for a contract for the publication of a magazine involving an expenditure of \$40,000 or \$50,000 a year, and I would submit that to several of your own members, is there involved in your local organization a plan whereby those bids would be submitted to an expert to figure out for them?

Mr. FINLAY. In the typothetæ; no, sir.

Commissioner O'CONNELL. You can not imagine a condition of contract of that kind?

Mr. FINLAY. No.

Commissioner O'CONNELL. I speak from personal experience.

Mr. FINLAY. Not with the typothetæ.

Commissioner O'CONNELL. The contract involved \$40,000 a year, and is a contract which I have handled for many years, upon which I am supposed to get bids every year.

Mr. FINLAY. I would like to present you with a copy of the constitution and by-laws, which prohibit anything of that kind.

Commissioner O'CONNELL. You imagine a condition of contract of that kind could not exist where you could not get a bid that would vary more than a sufficient amount to pay for the movage for your plates from one place to another?

Mr. FINLAY. I can, very nicely, imagine such a condition. Ninety-five per cent of the printing business was conducted without any union system. We have been spending enormous sums of money to establish standard cost systems. Our association has a standard cost system. Dean Gay, of Harvard College, addressed us at Somerset in January, and complimented us in saying that we were the only industry he had investigated that had a uniform system of ascertaining costs.

Commissioner O'CONNELL. You think under your system there would be competition for a contract by a number of such large concerns as we have in Washington?

Mr. FINLAY. I do not think you have any very large concern in Washington. Commissioner O'CONNELL. We do some pretty big work in Washington.

Mr. FINLAY. Oh, you have the Government Printing Office here, of course.

Commissioner O'CONNELL. We publish some very large magazines here. We publish sixty or seventy thousand of one every month.

Mr. FINLAY. That is a small edition for a magazine to-day.

Commissioner O'CONNELL. I have had experience in having seven different men bid on that contract.

Mr. FINLAY. I do not think we have seven members in Washington, so that relieves us of that.

Commissioner O'CONNELL. You do not think there is any such condition existing in the typothetæ?

Mr. FINLAY. No, sir; not that I know of. I do not believe there is any such condition.

Commissioner O'CONNELL. What percentage of your members now operate on the eight-hour basis?

Mr. FINLAY. All of them.

Commissioner O'CONNELL. That is all, Mr. Chairman.

Commissioner WEINSTOCK. Mr. Finlay, is your company working under an agreement with the union?

Mr. FINLAY. Yes, sir; local pressmen and feeders.

Commissioner WEINSTOCK. You deal altogether with local organizations?

Mr. FINLAY. This is part of our constitution and by-laws.

Commissioner WEINSTOCK. But in the event of a dispute, if you should be unable to agree with the locals—

Mr. FINLAY (interrupting). We are unfortunate in that in our pressmen and feeders' agreement. Those agreements—and I am perfectly willing to file them—do not have the signatures of the international officers, nor are they sanctioned by them.

Commissioner WEINSTOCK. If you should be unable to agree locally, what happens?

Mr. FINLAY. We have no recourse through the national organization of the printing pressmen and assistants' union.

Commissioner WEINSTOCK. You are obliged to stand subject to strikes or lockouts?

Mr. FINLAY. Yes. We were under the international.

Commissioner WEINSTOCK. Is that a wise or an unwise condition?

Mr. FINLAY. From the experience we have had we can not be any worse off. We had the national agreement.

Commissioner WEINSTOCK. You stated a while ago that under your old national agreement the workmen went out as individuals?

Mr. FINLAY. Yes, sir.

Commissioner WEINSTOCK. Did they not then go out as individuals simply as an evasion of the agreement?

Mr. FINLAY. Absolutely.

Commissioner WEINSTOCK. It was a clear case of evasion?

Mr. FINLAY. Yes.

Commissioner WEINSTOCK. If that was so, what use was there in renewing the agreement, if it could be so easily evaded?

Mr. FINLAY. We had in this 1907 agreement reached the time when we were coming to the eight-hour day. We realized that in the first strike of the International Typographical Union, which was on at that time for an eight-hour day, the sympathy naturally of the pressmen and feeders was with their brother

compositors, and that is why the agreement was violated in the way it was. Then we negotiated our agreement, and Mr. Berry and Mr. McManus were elected president and secretary, respectively, and, of course, after that we never wanted any more agreements.

Commissioner WEINSTOCK. So you deal altogether with the locals?

Mr. FINLAY. Altogether with the locals; yes.

Commissioner WEINSTOCK. And you do not in any way recognize the national?

Mr. FINLAY. No.

Commissioner WEINSTOCK. But your body has a national conference, has it not?

Mr. FINLAY. Yes.

Commissioner WEINSTOCK. But your national conference will not deal with the national conference of the printers?

Mr. FINLAY. We do not have any national agreements except those two that I know about.

Commissioner WEINSTOCK. Under your local agreement, do you have closed or open shops?

Mr. FINLAY. We have absolutely an open shop in Boston. I want you to understand my idea and explanation of an open shop is entirely different from the way the founders stated it yesterday. I mean by "open shop" where union and nonunion men work together, and all of them receive a minimum wage or more. That is what I consider an open shop.

Commissioner WEINSTOCK. You are at liberty to hire any man you please?

Mr. FINLAY. Absolutely. We are not in agreement to pay them the scale, and I do not know of a person running an open shop who can run an open shop successfully and pay a wage scale. I have no sympathy with it.

Commissioner WEINSTOCK. Your agreement with the local union permits you to employ nonunion men, so long as you pay the wage?

Mr. FINLAY. Absolutely. Our negotiations broke off with the feeders in 1904. The scale of wages then was \$16.50 a week. When we settled the eight-hour day the scale was \$18. We voluntarily made it \$20. It took the International Typographical Union three years to get it up to that point. I was chairman of the scale committee, and have been for eight years. When we negotiated those new scales in June with the pressmen and feeders' unions, we also established a new scale for compositors at the same advance which we gave those people, and we have been in the peculiar position since 1904 of the typographical union in our city taking our scale and going around and asking the union business there to pay it. We have a city or municipal plant there, and they go to them and say, "Here is the typothetæ scale; we guess you will have to pay it." That is the scale that is accepted by the typographical union.

Commissioner WEINSTOCK. It has become standard?

Mr. FINLAY. Yes, sir.

Commissioner WEINSTOCK. A little while ago you explained that in the city of Worcester, an hour's ride from Boston, that the wage rate is \$16 a week in certain departments and the Boston rate is \$21?

Mr. FINLAY. Yes, sir.

Commissioner WEINSTOCK. How is that explained that there is such a wage difference? There is a difference of over 25 per cent.

Mr. FINLAY. They have a typographical union up there.

Commissioner WEINSTOCK. How does it come there should be that wide gap within so limited an area?

Mr. FINLAY. I can not explain that. It has bothered us. Within an hour's ride there is a difference of practically \$1 a day on each compositor.

Commissioner WEINSTOCK. How can you compete?

Mr. FINLAY. We can not compete.

Commissioner WEINSTOCK. I should think the business would naturally fall to Worcester?

Mr. FINLAY. It does. Permit me to say that in catalogues and even grades of halftone work, they do in the Commonwealth Press as well as anybody in this country. There are places where wage scales like that are in force where they can not turn out the product, but there is a case where they can get just as good a job as they can in Boston.

Commissioner WEINSTOCK. I take it the Worcester printers are just as ambitious and just as desirous of earning as much money as possible as are the Boston printers. How does it come that they do not jump from their employment there and go to Boston, or endeavor to raise their employers there to the Boston standard?

Mr. FINLAY. Mr. Brady, who is the national organizer for New England—and they turn all kinds of work in New England over to the international organization—under sanction of the international organization, in talking to me and trying to get a preferential-shop agreement, discussed that very point. They do not demand the closed shop, but they want the preferential shop, which ultimately, to my mind, is going to be a closed shop. You have got to give preference. I have negotiated recently for the J. S. Cushing Co. a preferential-shop agreement on account of the pressure that has been brought to bear by the typographical union there through a large customer. He says that if I will make an agreement for the Boston Typothetae, tying them up to the preferential closed shops, they can get together and will go to Worcester and Springfield, where the wage scale is low, and take it up with the typographical union there and put them up where they belong.

Commissioner WEINSTOCK. But you have this advantage, have you not, by virtue of your paying over 25 per cent over the Worcester scale, that you have the pick of the men?

Mr. FINLAY. We do.

Commissioner WEINSTOCK. You get the best and they get the poorest?

Mr. FINLAY. Not exactly so. A young man learns the printing business and comes up in Worcester as a printer, and it is his home, and he is quite likely to stay there. We have found that particularly so in Cambridge, where the University Press has been in existence for years and years, and where the University Press is with families going right along and rotating, so that while they have a good deal lower scale, you can not get them to come to Boston, though they can get there in seven minutes.

Commissioner WEINSTOCK. Is there that much difference between the cost of living in Worcester and the cost of living in Boston, in the way of rent, etc.?

Mr. FINLAY. I think the only difference in the cost of living there would be in the rent.

Commissioner WEINSTOCK. Foodstuffs and raiment are just the same?

Mr. FINLAY. I think so.

Commissioner WEINSTOCK. That difference in the cost of rent would not equal 25 per cent of the wage?

Mr. FINLAY. Oh, no.

Commissioner WEINSTOCK. You say you have the open shop principally in Boston?

Mr. FINLAY. Absolutely.

Commissioner WEINSTOCK. You are at liberty to employ any man you please so long as you pay him a standard wage, but as a matter of fact, what percentage of your people are unionists and what nonunionists?

Mr. FINLAY. I think all of my pressmen and feeders are union. Mr. Berry will state that. I think. My foreman is not.

Commissioner WEINSTOCK. So that while theoretically you have an open shop, practically you have a closed shop?

Mr. FINLAY. No; I do not agree to that, because I do not have to ask a man whether he belongs to the union or carries a card or whether he can come there or not. I do not care how many cards he carries or how many he does not carry. If he can perform his duties, I will pay the wages.

Commissioner WEINSTOCK. Has it been noticeable in your shop, which comes under your personal supervision, that union men made things uncomfortable for the nonunion men unless they joined the union?

Mr. FINLAY. No.

Commissioner WEINSTOCK. There has been no such pressure brought to bear?

Mr. FINLAY. No.

Commissioner WEINSTOCK. Men come there as nonunion men and become union men from choice, presumably because there are certain advantages gained by being union men?

Mr. FINLAY. To them; yes.

Commissioner WEINSTOCK. That is, the unions make it attractive for the men to join

Mr. FINLAY. Yes; generally; and I presume they make it attractive.

If I may, I would like to say just a word here on this open-shop question. There are certain members in our national organization who do not believe that we run open shops in New England. They do not believe it is possible. They think they are being hoodwinked when they claim a union man will work with a nonunion man.

Commissioner WEINSTOCK. Who believes that?

Mr. FINLAY. Some of our national organizations.

Commissioner WEINSTOCK. Employers?

Mr. FINLAY. Yes. I mean from the West; they do not believe it is possible.

Commissioner WEINSTOCK. Do they think you are trying to deceive them?

Mr. FINLAY. No; they think we are being deceived.

Commissioner WEINSTOCK. What disadvantages, if any, have you found developed from the system you are following with labor?

Mr. FINLAY. No disadvantage.

Commissioner WEINSTOCK. What advantages do you find?

Mr. FINLAY. I retain my self-respect. I believe every man should be allowed to earn his living. I believe the Constitution guarantees him that, and I am not going to be a party to breaking it.

Commissioner WEINSTOCK. I did not make myself clear. I mean what advantage did you find in having an agreement at all with the union?

Mr. FINLAY. I believe in—no, I will not say I believe in a uniform wage, but in a minimum wage and uniform hours for an industry.

Commissioner WEINSTOCK. And for that reason you think it wise to deal with the union?

Mr. FINLAY. On that basis.

Commissioner WEINSTOCK. What proportion of the employers in Boston pursue your policy?

Mr. FINLAY. The typhotetæ pursue it, and the unions make the others do likewise.

Commissioner WEINSTOCK. That represents what proportion of the employers of printers?

Mr. FINLAY. In the city office, in the municipal plant, they probably have in there and in the State plant, which is a private institution, 450 employees.

Commissioner WEINSTOCK. What proportion of those employing printers in Boston are in your association?

Mr. FINLAY. Not many; but I could answer that question this way better: Not the majority of the printers, but the majority of equipment.

Commissioner WEINSTOCK. That is, the association represents the larger part of the printing pay roll of the community?

Mr. FINLAY. That is correct.

Commissioner WEINSTOCK. What disadvantages do the employers labor under who are not members of your organization?

Mr. FINLAY. We make the scales, and they do not participate in them or have anything to say about them.

Commissioner WEINSTOCK. They abide by them?

Mr. FINLAY. Yes.

Commissioner WEINSTOCK. They accept your scale?

Mr. FINLAY. The union passes that scale on to them.

Commissioner WEINSTOCK. That is all, Mr. Finlay; thank you very much.

TESTIMONY OF MR. GEORGE L. BERRY.

Mr. BARNETT. Mr. Berry, will you give your full name, residence, and your official position?

Mr. BERRY. My name is George L. Berry; I am president of the International Printing Pressmen and Assistants' Union; my home is Rogersville, Tenn.

Mr. BARNETT. When did you become president of the pressmen's union?

Mr. BERRY. June, 1907.

Mr. BARNETT. You were interested, however, before that, I presume, in the working of the agreement which was made in 1903 with the typhotetæ?

Mr. BERRY. Not as an international official, but as a local member of the organization, I was familiar with its application.

Mr. BARNETT. Do you know anything as to the Boston strike of which Mr. Finlay spoke and what the feeling was in the union with reference to that particular matter?

Mr. BERRY. Only from the records of the case as found in the international headquarters, through correspondence, etc., and what I have heard through testimony from the typhotetæ and from the union representatives.

Mr. BARNETT. State what the difficulty was in Boston and what the action of the union was.

Mr. BERRY. I think, in substance, from information that I received, that the position taken by Mr. Finlay is just about in line with the facts as regards that difficulty.

Mr. BARNETT. That is, the union did violate the agreement?

Mr. BERRY. That is, that union or its members individually, acting upon the request, indirectly or directly—I do not know, of course—of the typographical union, who were in difficulty, did individually quit their positions in order to assist the typographical union. As I say, that was before my administration.

Mr. BARNETT. Had the president of the pressmen's union at that time any power to force those members back to work? Would it have been possible for him to do that?

Mr. BERRY. Under the laws of the organization I would say that the president should have exercised his judgment and his authority in endeavoring to fulfill his agreement. As an example, during a number of occasions, a half dozen in any event, during my administration as president, I have had similar difficulties where men have violated local agreements and awards and taken action, and we have forced them back to their positions or filled their places by other union men.

Mr. BARNETT. Have you ever taken away the charter of a local union? You heard Mr. Lynch's testimony, did you not?

Mr. BERRY. Yes.

Mr. BARNETT. Have you ever taken away the charter of a local union on account of its refusal to abide by an agreement or an award?

Mr. BERRY. No; we have threatened and set periods whereby, if they failed to comply with the order of the board or of the president, their charter would be taken away.

Mr. BARNETT. You have threatened them?

Mr. BERRY. One example, if I may be permitted?

Mr. BARNETT. Yes.

Mr. BERRY. Mr. Weinstock is undoubtedly familiar with this. In the San Francisco Bulletin matter of 1909, an arbitration contract existed. An award was made through our process of conciliation and arbitration. The newspaper pressmen, after the earthquake, decided there had been a change in conditions, and endeavored to establish a new condition contrary to the provisions of the award and the procedure of mutual conciliation, etc. They struck and enforced the employment of additional people and the changing of shop practices. The international union gave them a certain period of time to go back to the conditions provided under the award, and failing to do so, that we would take their charter away. They waited until the last moment, and then complied with the award. I want to say, as a matter of record, that the International Printing Pressmens' Union then paid voluntarily to the San Francisco Bulletin the exact amount of damage that had been sustained in the interim.

Mr. BARNETT. In Mr. Finlay's testimony, Mr. Berry, he made reference to an injunction issued in 1907, which forbade the officers of the international union, yourself, and others, to expend the funds of the union in a strike then pending. Have you any further statement to make with reference to that injunction?

Mr. BERRY. Mr. Finlay is correct in the matter—speaking of the contract leading up to that point—in saying that we had a contract that expired in May, 1907. That contract had been in vogue for five years previously between the United Typothetæ of America and the International Printing Pressmen and Assistants' Union. At the convention at Pittsburg of the international union in 1906, the board of directors, made up of five men, three vice presidents, the president, and the secretary-treasurer, were instructed to meet with the United Typothetæ and pursue certain lines of negotiations looking to the establishment of another contract with the United Typothetæ. The board met with the typothetæ, and a majority of the board entered into, as they thought, another agreement. At the convention of 1907, held in New York, the international union, by an overwhelming majority vote decided that the board of directors violated their instructions in making this agreement with the United Typothetæ; that they exceeded their authority and rights; and moreover that in the alleged agreement there was no feeling of the mutuality between the two parties, particularly in that the typothetæ had reserved the right of confirmation, but had denied the right to the pressmen to confirm the agreement. The convention took the position that if the so-called open-shop clause, which has been touched upon by Mr. Finlay, was eliminated the organization would proceed along for the sake of harmony and peace, under the remaining part of the agreement, for its natural life. The new board, of which I was the chairman, was instructed to meet with the typothetæ and

endeavor to have that change made. We felt that no agreement existed, but in that the typhotetæ felt there was an agreement, we wanted to exercise every precaution to prevent a rupture between the two organizations.

We met with the typhotetæ in September, 1907, at Niagara Falls, and asked for the elimination of the so-called open-shop provision. The typhotetæ in convention and their representatives took the position that the contract had been made and that it was final, and that there was nothing further to discuss in relation to it.

Mr. BARNETT. May I interrupt for just a moment at that point? Were the members of the negotiation committee of the typhotetæ under the impression that the committee from the pressmens' union had no power to enter into such contracts?

Mr. BERRY. They so stated.

Mr. BARNETT. Do you know whether the members of the pressmens' union did hold out to the typhotetæ members that fact?

Mr. BERRY. I do not know as to the board of directors taking that position.

Mr. BARNETT. I mean representatives from the pressmens' union?

Mr. BERRY. I do not know, of course, because I was not a member of that board; but it is reasonable to presume, being fair, that the typhotetæ thought there was some indication that the contract would stand. I am rather inclined to believe that our representatives advised the typhotetæ that they could get it over, but, of course, they failed in that because of the dissatisfaction of the membership as to the agreement.

Mr. BARNETT. I have here in my hand the report of the conference containing one of the proceedings of the United Typhotetæ, and desire to read this statement:

"Mr. HIGGINS. I will tell you right off the reel. The committee have got unlimited power. If, in the judgment of the committee, they think they have got a good thing they will close it up. If not, they will submit it to the membership."

Mr. HIGGINS was chairman of that committee?

Mr. BERRY. He was president of the international organization at that time.

Mr. BARNETT. You think the typhotetæ members thought they were making a contract at that time?

Mr. BERRY. I think they fully understood the situation, and I believe they all were confident Mr. Higgins would be able to get the contract confirmed. I do not think there was any misunderstanding upon the part of the typhotetæ about it.

Mr. BARNETT. You think Mr. Higgins thought he had full power to make the contract?

Mr. BERRY. No; I do not think that; but I am pretty sure he thought he would have it confirmed by the convention.

Mr. BARNETT. Proceed, Mr. Berry.

Mr. BERRY. At the September meeting in Niagara with the typhotetæ they disagreed, or refused, rather, to make that change. Then, following up the instructions of the convention of 1907, we referred the entire matter to our membership for a vote as to whether they would place a 10 per cent assessment upon their earnings for the immediate inauguration of the eight-hour work day and the enforcement of the eight-hour work day on January 1, 1908. That was placed before the membership and was carried—a 10-per-cent assessment and an eight-hour day—in November, 1908.

Immediately the attorneys for the typhotetæ sought a temporary restraining order, and it was secured from Judge Thompson, of the Ohio Federal district court. Judge Thompson succeeded President Taft on the bench in that district. They secured an injunction. We were enjoined from counting the votes, enjoined from collecting moneys or paying benefits, and enjoined in every way, directly or indirectly, in the enforcement of the eight-hour work day or the union shop.

Of course, we fought the case, and the court—Judge Thompson—decided in the final hearing upon the case that our board of directors had exceeded their authority and instructions given them by the Pittsburgh convention, and that no contract existed. The typhotetæ then took the case to the United States court of appeals, and the United States court of appeals sustained Judge Thompson in his decision, deciding that there was no contract, that the board had exceeded their authority, had no right whatever to make a final and binding agreement, and, of course, the injunction was dissolved and we proceeded to establish the eight-hour work day in the industry.

I wanted to make that statement while Mr. Finlay was here. The lower court decided specifically—and, of course, I have the documents, which I will be glad to serve upon this commission, and I think Mr. Finlay will agree I am correct in that statement; I know there was another gentleman present who was a member of the typhotetæ board at the time who will substantiate my position in this matter. The injunction was dissolved, and we won in the lower Federal court, and also in the United States court of appeals.

Does Mr. Finlay want to ask me a question?

Mr. FINLAY. When did you get that decision from the court of appeals?

Mr. BERRY. The final decision was rendered in February, 1908.

Mr. FINLAY. Did you establish the eight-hour day in Boston in 1908?

Mr. BERRY. We did; the best we could.

Mr. FINLAY. Not in a Typhotetæ office. We lived up to our agreement and established the day in January, 1909.

Mr. BERRY. It is perfectly true, in order that Mr. Finlay may not misunderstand the position, that wherever there were local contracts in existence at the time of the referendum vote, the international union did not violate or break its local agreements. I am quite confident Mr. Finlay had a local agreement in Boston with local unions; otherwise an eight-hour day would have been enforced.

As further proof, which he can verify from his present president, Mr. Courts, of Galveston, Tex., Mr. Courts employed members of our local at that time, but we did not break that local agreement because there was no question as to its validity. Wherever there was a local agreement in existence, we observed it expressly, but we did not observe the so-called international agreement for the very fact that both the lower court and the court of appeals sustained us in our claim that it was illegal and did not exist. That is possibly the reason why Mr. Finlay did not have trouble in Boston. It is also the reason why the Curtis Publishing Co., of Philadelphia, and the Typhotetæ members there, did not have any trouble for the fact that we had local agreements that were absolute.

Mr. BARNETT. Do you think this agreement, drawn up in 1907, was a good agreement for the preservation of industrial peace? Would you favor the making of such an agreement now on the part of your union—that is, the agreement of 1907 is practically the same as renewed or supposed to be renewed in 1912?

Mr. BERRY. It was supposed to be renewed in 1907.

Mr. BARNETT. Yes; and to run until 1912.

Mr. BERRY. No; I would not approve, for the fact that in the agreement that we experienced, which was identical in nature for five years previous to 1907, it was an express agreement for the employers. It was an agreement that carried no spirit of mutuality, no spirit of genuine cooperation between the two parties. It was an agreement that was predicated, in my opinion, upon the theory of destroying the trades-union movement rather than recognizing it.

Mr. BARNETT. What do you mean specifically by that?

Mr. BERRY. In that it recognized the right and in that it established the right for the employer to discriminate against union men or nonunion men as they might determine—and by that I mean in their employment. The records show, during the period of that agreement, that we actually deteriorated in the matter of numerical strength rather than increased in comparison to the growth of the commercial industry. That was borne out in a number of examples, several of them in Boston where the agreement was actually in existence; the employers did not have a union man in their establishment.

Mr. BARNETT. It has been testified that in Mr. Finlay's shop, under an open shop, all the pressmen Mr. Finlay thinks are union pressmen. Do you feel that certain employers have dealt differently under this clause with their employees from the way in which Mr. Finlay deals with his?

Mr. BERRY. Mr. Finlay's office, or the office with which he is connected, I am inclined to say, is rather an exception to the rule in the matter of working conditions, in so far as our experience goes with the United Typhotetæ agreement. I think Mr. Finlay's explanation of the conditions in the immediate vicinity of Boston proves the impracticability completely of any agreement that does not specifically recognize organized labor. The organized labor, with its union recognition, is the best and most practical instrument in the maintenance of a sane and fair competition. Wherever the union is the strongest in this country and where it is recognized by the employers as such, you will find the industry in the most prosperous condition. Wherever the union is weakest,

you will find the commercial valuation of the industry at the lowest ebb, for the very fact that employers working nonunion men deal with their people individually, and they can hire and discharge them and impose upon them such conditions as they, the employers, may dictate. The result is an irregular and unsound competitive condition. Why? Because of the very fact that labor is the chief cost of production, and if there is not a comparative uniformity in that cost, giving recognition to efficiency, then there can not be uniformity in competition.

Now, if Mr. Finlay and his Boston friends recognized the printing-trades unions of this country and had gone along with them on the theory of genuine cooperation and collective bargaining he would not be complaining of the condition in Worcester and Lowell and their competitive irregularities, and for that reason, aside from the fact that the contract was destroying our union—aside from that very important fact—we were opposed to the agreement, because it had for its end, in my opinion—and I think we can bring to bear sufficient proof to bear out this fact—that it was undermining the commercial printing industry of this country.

Mr. BARNETT. Have you ever heard of a printers' board of trade—have you ever heard that expression?

Mr. BERRY. Yes.

Mr. BARNETT. What is the printers' board of trade?

Mr. BERRY. A printers' board of trade is an organization presumably to establish prices on printers.

Mr. BARNETT. It has no connection with the Typothetæ?

Mr. BERRY. I don't know. I take Mr. Finlay's word for it that it has not.

Mr. BARNETT. Do you think it would be a desirable thing from the standpoint of the employees of your union to have a printers' board of trade established generally throughout the United States, so that the cost of printing could be standardized—the price as which printing could be sold? You spoke in favor of standardization of competitive conditions. Would you like to see that state of affairs brought about, from your standpoint as a union president?

Mr. BERRY. Our organization is in favor of any system within the industry that will promote the commercial valuation of the industry for its union, and if the board of trade recognizes the organized-labor movement and recognizes its employees as essential factors in the industry, under contractual relationship, I am prepared to say that our organization would heartily join in any movement in the uplift and promotion of the industry.

We believe—the international printing pressmen and assistants—notwithstanding the fact that it is known as a militant union, and notwithstanding the fact that it has been classified on a number of occasions as a contract-breaking union, we nevertheless are of opinion that the success of the printing industry means our success, and we can not expect to be prosperous unless our industry is prosperous.

Mr. BARNETT. So that you would agree with Mr. Mitchell, practically? He said the other day he thought there ought to be some arrangement by which the coal operators would be allowed to agree as to prices and he thought that it would be a good thing for the unions. Now, you think in the printing trade locally such arrangements would be desirable from the standpoint of the union?

Mr. BERRY. I think, in my experience as president of this organization, that the most stable and positive and essential instrument in the maintenance of healthy, equitable competition is in the recognition of the uniform-wage scale by and through organized labor, because it prevents the adventure and it destroys all the possibility of the employer maintaining his business on a low-wage scale and saving losses by cutting prices when he finds himself in difficulty.

Now, the employer with organized labor, he knows what it costs him, comparatively, to produce his work. If his competitor is employing union men, he also knows that his competitor is paying a certain wage for his labor, which is the chief cost, giving consideration to the matter of increased efficiency of men, etc., that is a naturally potent feature. He knows that he can not go below a certain figure and that if he does that he has to lose, and not the men that he employs are to lose. In a nonunion shop, as I have had experience, where nonunion employers to save their losses have cut wages and increased hours and, in general, changed working conditions in order to cover up their own inefficient business capacity.

Mr. BARNETT. So at the present time what part of the shops in which your members work are composed exclusively of unionists—how far do your members work in what are called open shops?

Mr. BERRY. There is no such thing as an open shop in our organization; it is either union or nonunion.

Mr. BARNETT. Take a shop where the employer exercises his right to employ whom he will, as in Mr. Finlay's case. Do you call Mr. Finlay's shop a union shop or a nonunion shop?

Mr. BERRY. I think a union shop. I think he has exercised very wise business judgment in employing, as it would happen, all union people.

Mr. BARNETT. How do you account for the fact that Mr. Finlay does not know that his shop is a union shop?

Mr. BERRY. I really don't know; maybe he does not look in that direction; but suffice to say it is one of the very prosperous concerns of Boston.

Mr. BARNETT. Have you at the present time any agreement with the American Newspaper Publishers' Association?

Mr. BERRY. No, sir.

Mr. BARNETT. When was the first agreement with the publishers made?

Mr. BERRY. About the same time as the contract with the typothetæ.

Mr. BARNETT. 1903?

Mr. BERRY. Yes; that was the second agreement.

Mr. BARNETT. Was it made as early as the agreement of the typographical union with the publishers or later?

Mr. BERRY. About the same time.

Mr. BARNETT. Was it substantially identical throughout its history, or were the same changes made in your agreement as Mr. Lynch has described in regard to the International Typographical Union?

Mr. BERRY. Our agreement with the newspaper publishers was comparatively uniform from the date of its adoption to the date of its expiration, and the only material difference between the contracts was in the matter of conciliation and arbitration. Ours provided for an odd man, whereas the typographical union contract provided for an even number.

Mr. BARNETT. That is, throughout its history yours provided for the odd man?

Mr. BERRY. Yes.

Mr. BARNETT. You never abandoned that?

Mr. BERRY. No.

Mr. BARNETT. The other organization had it out at first—they took it out and then put it back?

Mr. BERRY. Yes.

Mr. BARNETT. Was this contract successful in avoiding industrial difficulties?

Mr. BERRY. Yes; the publishers' contract in general, or as a general proposition, was eminently successful and satisfactory.

Mr. BARNETT. Did you have any strikes under it—any strikes in shops that had contracts?

Mr. BERRY. Yes; the one that I referred to in the San Francisco Bulletin office, and we had one in Denver and one in the Inter-Ocean in Chicago. The San Francisco incident I have already explained to you. In the Denver incident we have compelled our men to return to work and adjusted the matter satisfactorily. In the Inter-Ocean controversy in Chicago in May, 1910, we filled the places of our men who struck in violation of the contract and fulfilled the contract in its entirety, at an expense of approximately \$7,000.

Mr. BARNETT. Will you explain what you mean by filling the places of the men? What did the international do?

Mr. BERRY. As soon as the men walked out, of course we ordered the union to place them back and proceed under the provisions of the contract. The men declined to return, and we secured men from other organizations and published the paper.

Mr. BARNETT. You did not take away the charter of the union?

Mr. BERRY. No.

Mr. BARNETT. Was any penalty imposed on the men who went out?

Mr. BERRY. The international board of directors—and the convention sustained the board of directors in that position—decided that the international would bear the expense, and figured that the union had been sufficiently disciplined.

Mr. BARNETT. Through the men losing their positions?

Mr. BERRY. Yes; they were not taken back to their positions.

Mr. BARNETT. No fine was imposed on either the men or the union?

Mr. BERRY. No.

Mr. BARNETT. When did your agreement come to an end with the publishers?

Mr. BERRY. It ended May 1, 1912; we have no agreement with the A. N. P. A. at this time.

Mr. BARNETT. How did it end?

Mr. BERRY. By natural limitation.

Mr. BARNETT. Why was it not renewed?

Mr. BERRY. Our membership defeated it by the referendum vote.

Mr. BARNETT. Have you any idea as to why your members were opposed to a continuance of it? What are the arguments?

Mr. BERRY. Chief were the difficulties in Chicago. This has no connection with the Inter-Ocean situation to which I have referred; that was in 1910. Unfortunately, I think, and I think it is the weakness in the A. N. P. A. contract, but it exists, that the other three international unions that have had contractual relationship with the publishers do not require their members to take out arbitration agreements. I presume Mr. Lynch in his explanation of the procedure touched that phase of it.

Mr. BARNETT. Yes.

Mr. BERRY. We could not secure from the publishers any other change. The agreement was made with them as a general proposition, carrying with it a clause whereby any local publisher could apply for a local agreement. It was not a compulsory proposition. I feel that that was the weakness for the very fact that a number of the publishers evaded coming under that agreement, a number of publishers ran nonunion shops, and yet participated in the making of the agreement.

Now, in Chicago there was only one paper aside from the Inter-Ocean that held an international arbitration agreement. All the other newspapers worked under a separate and distinct agreement locally, having no association whatever with the international arbitration agreement. That publishers' association, by virtue of lack of responsibility to this national organization, constantly evaded the matter of considering wage scales and changes in shop practices. As an example, for two years and a half prior to May, 1912, we had been negotiating with the Chicago Publishers' Association with the view of increasing our wages, a wage that had been in effect there for approximately eight years, the publishers holding a local agreement with us that was practically perpetual, yet providing for arbitration and the opening of the wage scale after a certain given time, consistently evaded entering into arbitration of that scale of wages.

Our membership insisted that the American Newspaper Publishers' Association should compel those publishers in Chicago to enter into arbitration and settle the matter. We could not do it for the very fact that the employers there would not take our arbitration agreements. The result of the case was that when it came up for readoption the membership insisted that there should be a clause requiring that every member that employed our members throughout this continent, every member of the publishers, should be compelled to take out an arbitration agreement, so that we might proceed with some degree of uniformity. The publishers declined to accede to that proposition, and for that reason, the chief reason, the membership refused to renew the proposition.

Another very important reason developed in the lockout that was precipitated in Chicago by two members of the publishers' association—one member of the publishers' association who owns two newspapers in Chicago. This publisher, who by name is Mr. William Randolph Hearst, owning the American and the Examiner in Chicago, held with our union a national arbitration contract that expired automatically with the international agreement of May 1, 1913.

Mr. Hearst's newspapers—I want to cover this as briefly as I can, but I want to give you the responsibility there—I am sorry that the publisher's representative is not here, incidentally, so that he could listen to my testimony—but prior to May, about one year prior to May, 1912, Mr. Hearst's newspapers opened arbitration proceedings with us, and by arbitration—it may sound odd to some of the employers' representatives present, but by arbitration, wages were decreased and hours increased. It has been said that arbitration has but one purpose, and that is to decrease hours and increase wages, but in this instance arbitration decreased wages in Mr. Hearst's newspapers, and increased the hours in the Hearst newspapers.

The basis for that decision of the international arbitration board was that Mr. Hearst's papers were not being treated justly by the union in the matter of the competitive cost of production. That difference in the condition, which was true, was the result of Mr. Hearst's entering the newspaper field and voluntarily establishing, for the spectacular purposes for which he is so well known, a wage scale and a condition of employment that exceeded in great extent any

that existed in all the other newspapers in Chicago. When he entered the field we held a contract with the local association. He was not a member of the A. N. P. A.; he was not a member of the local association; he was an independent publisher, if you please, and he gave us a wage scale that was 30 per cent more than that of any other paper; he employed more men; he worked less hours. In general, he gave us a condition that was exploited among the working people of Chicago, and the outcome was that he built his circulation and his business upon that condition.

Later, however, he changed his mind, and he became an associated publisher with the A. N. P. A., and the local association in Chicago, and applied for an international arbitration agreement. We were compelled to give it to him, and we did consent to it. It was issued to him, and instantly upon the expiration of this agreement that he had made, giving us this condition that had been in operation for approximately 10 years—wages, hours, and conditions—then he moved for a reduction in wages, an increase in hours, and a reduction in the number of men to that existing in the other newspapers in Chicago; and, of course, we had to accede to the proposition, and we went into arbitration, and we lost every point with the exception of the matter of the reduction of the number of men. Mr. Harry A. Wheeler, a very well-known gentleman in Chicago, and whose reputation I believe was beyond question, was the umpire in this arbitration. He visited the offices, and he stated that in view of Mr. Hearst's association there was no alternative possible for him to take except to bring Mr. Hearst to as near a uniform basis of cost for the labor as it was possible to do.

As I say, he allowed Hearst—that is, by a majority vote of the board—to decrease wages. The number of men he refused to decrease, for these four reasons following, which are very concrete, and which I am confident will appeal to the better judgment of this commission as practical.

Mr. Hearst's newspapers, printing approximately 375,000 pages, were printing from six presses, from one to a dozen editions in the afternoon, each meaning the changing of plates upon the presses, the running of color, all kinds of color appropriate to the incident, which means additional work. His competitor, the Chicago Daily News, an afternoon paper, ran two editions printed on 11 presses, with a much less circulation in the afternoon than Mr. Hearst's afternoon paper, and the 11 presses were covered by every scientific modern device for the operation.

As an illustration, these large newspaper presses, as big as this room; in many presses nowadays they have an automatic hoist, where you attach a chain to a roll, and by pushing a button the roll is carried to the top deck, higher than this ceiling. In Mr. Hearst's pressroom at that time there was not one of these presses that had an automatic hoist; they were old presses, and Mr. Wheeler decided that in view of these radical differences, which really made the cost of operation from that point of view much higher on the Chicago Daily News than it was on Mr. Hearst's paper, he would not change the number of men, and, moreover, that inasmuch as 37 per cent of the total number of men employed there had been injured at different times in the operation of those presses, it would be the height of folly and inhuman to reduce the number of men.

Now, that is Mr. Wheeler's version and the reasons that actuated him in refusing to reduce the number of men. We, of course, accepted the decision as it was, wages and everything. That continued until May 1, 1912. At midnight on May 1, 1912, the national arbitration contract expired by limitation, the local arbitration award expired by limitation, and on that night Mr. Hearst's manager placed in a conspicuous place in the pressroom copies of this document—and of all documents which I will be delighted to serve on this committee—a notice indicating that on and after to-night the conditions as applied to the number of men in the operation of these presses should be so and so; in other words, reducing the number of men on the presses, and the displacement of approximately 22 mechanics who had been working there for 10 or 11 years.

Our representatives went to Mr. Hearst's manager——

Mr. BARNETT. This was in 1912?

Mr. BERRY. This was May, 1912—May 1st, at midnight.

Mr. BARNETT. This was after your union had voted not to renew the agreement?

Mr. BERRY. Oh, no.

Mr. BARNETT. When did you vote not to agree to renew the agreement? The agreement expired in 1912?

Mr. BERRY. Yes; May, 1912—about that time.

Mr. BARNETT. About that time you were voting?

Mr. BERRY. About that time we were voting, but it was not announced.

Mr. BARNETT. I thought you just said that the international agreement expired that night.

Mr. BERRY. May 1, 1912, and we were then considering the proposition of renewing our international agreement.

Mr. BARNETT. Don't you consider the renewal of these arbitration agreements before they actually expire?

Mr. BERRY. Yes; we had been negotiating for months and had disagreed, chiefly upon the fact that the publishers would not force their members to take up arbitration agreements.

And, let me say, in addition to that the reason for the prolonged negotiation was this: Our organization took the position that there should be a blanket agreement covering not only the pressmen's union but the four unions of the newspaper industry, so that there might be genuine peace in the industry instead of constant conflict, one union being out and the other being in, and of course the publishers would not accede to that idea.

Mr. Hearst's manager directed the reduction of this number of men, and our people, over their signatures, copies of which we will produce if desired, requested that the conditions continue, and that we would again arbitrate the question if they were dissatisfied or any other question as regarded the operation of that pressroom, in order to maintain industrial peace in Chicago, but the manager of Mr. Hearst's paper advised that that was their ultimatum and that henceforth the number of men should be so and so.

Now, just let me say one or two words on the question of the reason for the stipulation about the number of men.

Mr. BARNETT. Suppose you go into that a little later, because Mr. Weinstock asked a question about that, and if you will condense that just a little on account of time—

Mr. BERRY. I will do that, but I think this is of the utmost importance, as showing why the agreement broke down.

When Mr. Hearst refused and locked our people out by his representative saying practically, "If you don't like this condition you can get out," we got out. He was then in contractual relationship with the other publishers of Chicago, and the other publishers found themselves in the embarrassing position of either breaking the contract with the union that we held, which was a perpetual sacred contract, or breaking a contract with their own member, Mr. Hearst, and the result was that upon the action of Mr. Hearst in locking our people out, forcing the fight upon us, every other publisher that was a member of the association in Chicago was compelled to do likewise, in order to live up to their preferred contract with Mr. Hearst and not live up to the contract with our union.

Now, the action of the publishers in that degree brought about the fight that followed, and the antagonism and delay and the unfair attitude that had been taken by these publishers in Chicago in that regard, and in the two years' constant refusal to arbitrate, the refusal of the A. N. P. A. to force their members to do the just thing and go into arbitration was the chief cause of refusal of the membership to adopt the agreement.

Mr. BARNETT. Do you regard this action on the part of the membership as wise?

Mr. BERRY. No.

Mr. BARNETT. You thought the agreement was a good thing, did you?

Mr. BERRY. Yes.

Mr. BARNETT. You think it would have been wise for the union to keep on?

Mr. BERRY. Yes.

Mr. BARNETT. How much was the majority against it?

Mr. BERRY. Just a few hundred.

Mr. BARNETT. Do you remember about how many votes were cast? How many members has your union?

Mr. BERRY. Thirty-one thousand. I think there were approximately 16,000 votes cast. We do not have any better success in our referendums than the international union.

Mr. BARNETT. And out of 16,000 votes just a few hundred defeated it?

Mr. BERRY. Yes.

Mr. BARNETT. So that the matter was pretty well canvassed by the union?

Mr. BERRY. Yes.

Mr. BARNETT. And after 10 years of the agreement they decided to let it go?

Mr. BERRY. Yes.

Mr. BARNETT. You think if the matter had not been voted on except at this particular time it would have carried?

Mr. BERRY. I think so, undoubtedly.

Mr. BARNETT. Has your association taken up any negotiations for a renewal of the agreement?

Mr. BERRY. No; it has not taken up any negotiations, but I am confident that we will renew negotiations.

Mr. BARNETT. You think that the agreement is a sound agreement in all particulars except in that particular you have mentioned; that is, that the publishers ought to require their members to run union shops and come into the agreement?

Mr. BERRY. I think, in addition to the weakness that I have pointed out, which applies to all—I think in addition to that is the question of the matter of securing the odd member.

Now, arbitration in the newspaper industry is not a tea party by a jugful, and ever since the organization was organized, in every newspaper on this continent outside of Chicago, with the exception of twelve, there are only twelve nonunion newspapers on this continent outside of Chicago, and our wages as a general proposition exceed those paid in the newspaper end of it of any other organization, and our hours are low; seven and a half hours nights, and we have an absolute universal eight-hour working day, by day work; and when we go into arbitration now it is not a question of the publishers giving us something, or we give the publishers something; it is a question of arbitration, and it is a case of fighting every point in connection with it; and, of course, as the result of that condition we are oftentimes forced to select a third man, and sometimes that is very difficult.

I believe we recommended in our proposition to the publishers, and I might say that we have agreed a number of times in advance of arbitrations, that upon the raising of the issue between the publishers and the union and the opening of arbitration we would agree that the condition arrived at, whether it was within one month, one year or two years, should date back to the time of the raising of the issue. We have agreed upon that a number of times, but it has been informal; it was not required in the agreement. That has satisfied the membership, because in the general delay of arbitration it is the employees that lose, and the employer gains, and in that way the membership have been satisfied.

We have also advocated the idea that was expressed here by Mr. Weinstock yesterday in offering to select the third man in advance of the arising of the dispute, but the publishers were not willing to accede to that point of view. Now comes this point: I believe that upon the making of a blanket agreement between the publishers and the four unions in the industry that increased responsibility will follow, that upon the failure of any individual union and employer to arrive at a conclusion, that when a reviewing board from these other three unions affected, with the employer, should step in. Then, if they fail, I think it is entirely a competent proposition, and I believe the Government would be exercising a wise and intelligent duty in extending the present Erdman Act and make, voluntarily at least, the right and possibility of the union and employer to appeal in advance of the difficulty, or at the time of the difficulty, for advice and assistance from the Government.

I disagree with Mr. Frey in the matter; I do not want to be placed in the attitude of even intimating compulsory arbitration, but I believe the Government would be fulfilling a great service, out of this commission or by this commission, or from your recommendations, if it would establish a board of some character that would at all times be willing and prepared to respond to industrial disputes; in that way I think we could gradually minimize them to practically nothing.

Mr. BARNETT. Did the newspaper publishers agree with you that the laws of your national union become effective in these agreements?

Mr. BERRY. Certain laws.

Mr. BARNETT. What laws of the national union did they specify; or did they agree, as they did with the typographical union, that the laws of the national typographical union relating to working conditions would be regarded as parts of the contract?

Mr. BERRY. I think that the typographical union—I am not sure about that, but I think our union, which would be a natural thing in negotiating a contract with publishers, would insist that our fundamental laws should be a part of the agreement. If there was any great opposition to any specific law, we discuss the reasons for the opposition and if we could arrive at a conclusion then we change that law to harmonize.

Mr. BARNETT. You did discuss those laws?

Mr. BERRY. Oh, no question about it; certain laws. About the fundamental laws, there was no discussion with the publishers about accepting them.

Mr. BARNETT. You heard Mr. Lynch say that they did not have any discussion?

Mr. BERRY. I did not hear him say that.

Mr. BARNETT. You heard him say that it was the object to have these rules decided entirely by the union, and not as the stove founders, by general strikes?

Mr. BERRY. Well, of course, the union knows best what it wants, and it knows best the application of the laws to govern its organization. I agree with Mr. Lynch on that.

Mr. BARNETT. Have you a rule as to the number of men on presses?

Mr. BERRY. No.

Mr. BARNETT. That is a local rule?

Mr. BERRY. No; it is not a local rule. We have no local rule.

Mr. BARNETT. Where it is enforced, it is a local rule?

Mr. BERRY. No; we have no local rule; it is a matter settled by contractual relationship.

Mr. BARNETT. Suppose you have no contract—or have you any places where you have no contract?

Mr. BERRY. Very few.

Mr. BARNETT. I did not mean only in newspapers, but in the book and job houses.

Mr. BERRY. Very rarely. I do not recall one.

Mr. BARNETT. So that the rules of the local unions do not contain provisions as to the number of men required on different sizes and varieties of presses?

Mr. BERRY. No; only in this, so that I may be thoroughly understood: In our negotiations, when negotiations are called by local unions and publishers, then that negotiation becomes a part of the local by-laws, but the number of men are subject to conciliation and arbitration.

Mr. BARNETT. Have you a national apprenticeship ratio?

Mr. BERRY. Yes.

Mr. BARNETT. Is that a part of your agreement with the publishers?

Mr. BERRY. Yes.

Mr. BARNETT. That was understood to be a part of it?

Mr. BERRY. Yes.

Mr. BARNETT. Was there any national rule of yours which was modified? Can you think of one which was modified?

Mr. BERRY. I really can not, Professor, but I know there was consideration; I know, particularly in regard to the Printers' League of America, a contract which I think is the broadest in existence; I know we modified some laws to harmonize with their views, but I do not recall the publishers exactly.

Commissioner O'CONNELL. Mr. Berry, about this Boston situation, how does Mr. Finlay settle his wage and hour conditions with his employees?

Mr. BERRY. By local negotiations with the unions there.

Commissioner O'CONNELL. With the pressmen's local unions?

Mr. BERRY. Yes, sir.

Commissioner O'CONNELL. Then he is dealing with the union?

Mr. BERRY. Yes, sir.

Commissioner O'CONNELL. Do you consider that is an open-shop condition, as Mr. Finlay puts it?

Mr. BERRY. Dealing with the local union and employing union men is certainly not an open shop.

Commissioner O'CONNELL. I understood he was running an open shop, and yet I understood all his pressmen are union men.

Mr. BERRY. Yes.

Commissioner O'CONNELL. In making a contract or getting working conditions from them it is natural to suppose he was dealing with the union?

Mr. BERRY. Yes.

Commissioner O'CONNELL. I want to know whether these union men in the press room had had a contract made with your local union as "Boston Union No. So-and-so."

Mr. BERRY. That is the relationship exactly, and it is negotiated by their local typhothetae, of which Mr. Finlay is a member, as to certain wage scales and conditions. I take it from what Mr. Finlay says—and I believe it is so—that members of our organizations are exclusively employed in his office. That is not the case in all the offices.

Commissioner O'CONNELL. In Mr. Finlay's office?

Mr. BERRY. Yes, sir.

Commissioner O'CONNELL. Does the contract Mr. Finlay holds with the pressmen's union in Boston read, "This agreement is between the blank company," whatever the name of his company is, "and the pressmen of Local Union No. So-and-so"?

Mr. BERRY. Yes, sir.

Commissioner O'CONNELL. It is not an arrangement made with the employees and Mr. Finlay?

Mr. BERRY. No, sir.

Commissioner O'CONNELL. It is made with the local union?

Mr. BERRY. Yes, sir. I think Mr. Finlay served copies of that contract on the commission.

Commissioner O'CONNELL. Do you know anything of the printer boards of trade and their methods of conducting their business?

Mr. BERRY. They are very diversified. I have known some of them, but there is no comparative uniformity in the matter of procedure, and I am not competent to answer that.

Commissioner O'CONNELL. You do not know whether the printers' board of trade in Boston or Washington or New York have an arrangement whereby prices are set by them for particular lines of work, and that bids submitted to them for work would be submitted to a central office and figured out?

Mr. BERRY. With a great many buyers of printing that is considered as being in existence, but I could not say that it does exist.

Commissioner O'CONNELL. What would you think of the idea of a Federal board, something on the order of the new Erdman Act, but a larger board, with a larger number of men—12 or 15 men to be appointed as a board for purposes of conciliation, and that sort of thing, with a view to bringing employees and employers together, with a view of getting between them when trouble arises, as a great big proposition for the adjustment of disputes, and not on one particular line, as the act now provides for men under transportation, but for the entire industrial community?

Mr. BERRY. I think, as a voluntary proposition, that it would be one of the most practical things the Government could undertake. I think it is perfectly sound, and it is absolutely necessary.

Commissioner O'CONNELL. Did you hear the statement of the representative of the founders' association the other day, who said he believed that better results would come to the workmen by not being members of the union and acting in their individual capacity rather than collectively? What is your experience in the matter of collective bargaining and collective dealing?

Mr. BERRY. Our experience is, as I have indicated, that our members are enjoying an exclusive eight-hour day and, in most instances, a seven and a half hour night and with an average wage that will equal any in this country, and that we have made for our membership as a result of our organization a standard of respectability and independence and citizenship that, in my opinion, could not be accomplished otherwise. In addition to that we have established benefits for our members that could not possibly have come to them had they been nonunionists. For instance, our home, our sanatorium, our trade schools, our death benefits, and all those things that go to the members of our organization, conditions they could not possibly have gotten had they acted individually with their employers.

Commissioner O'CONNELL. You think it is not possible for men dealing individually to bring about the same results they would obtain by dealing collectively?

Mr. BERRY. I do not think it is practicable for the men or sound business judgment for the industry.

Commissioner O'CONNELL. That is all.

Commissioner WEINSTOCK. Can a local union strike, Mr. Berry, without approval of the national union?

Mr. BERRY. No, sir; unless they take arbitrary action.

Commissioner WEINSTOCK. Are you familiar with the strike that either is or was going on in San Francisco?

Mr. BERRY. Yes, sir.

Commissioner WEINSTOCK. Was that with the approval of the national union?

Mr. BERRY. Yes, sir.

Commissioner WEINSTOCK. What about the talk that has been made to me by friends of mine who happen to be in the newspaper business, that the pressmen's union are demanding more men to be put on than is really necessary? What are the facts in the case?

Mr. BERRY. It is absolutely true. We demand not that more men be put on than are necessary, but we demand that the number of men be stipulated. It is not a tight or fast rule, as I have already indicated in my testimony. The question of the number of men is a negotiable point, just as is the question of wages. We take the position that the manning of a press should be determined because of the hazards of the business. We base our claim in this regard on the same principle that the Government bases its claim as to the number of men operating a shift. We say the employer who has no practical experience in the operation of a press the size of this room, should not have the sum total right of determining whether these men are risking their lives or whether they are properly protected. But we do not say that we shall have the exclusive right. We say that we know best as to the number of men that should operate a machine, but we take a more liberal point of view and say we will negotiate and even arbitrate the number of men upon presses.

For instance, Mr. Weinstock, going back to the San Francisco Bulletin controversy, that was over the number of men. The men struck to enforce an increased number of men, against an arbitration award in existence and against the arbitration contract that prevented strikes. We forced them back, and a year and a half later I went to San Francisco and took the matter up through the general form of procedure under the contract, and we selected Judge James G. McGuire as umpire in the matter of increasing the number of men on those presses, and we won our contest, and the men were increased on the presses. That was our procedure in that regard.

Commissioner WEINSTOCK. Do the pressmen's unions go out on sympathetic strikes, regardless of agreements?

Mr. BERRY. Oh, no; no, sir. I want to say on that phase that, except as has been indicated by ex-President Lynch, of the International Typographical Union, many of our local unions make local agreements carrying in the agreement a provision whereby, if the dispute arises between a sister union of the allied trades, and the employer refuses to arbitrate, then the contract becomes null and void.

Commissioner WEINSTOCK. It is a matter of contract?

Mr. BERRY. Yes. I want to add one more word on that for Mr. Lynch's protection. In the matter of the Chicago situation, the local typographical union worked when we had our lockout there, but there was no provision in that local agreement which made it possible for them to discontinue their work. A good many people, and Mr. Lynch, of course, took the position that they should not come out, and he maintained them in their position, much to our dissatisfaction and to our people's dissatisfaction. I throw that out for his benefit.

Commissioner WEINSTOCK. I take it you approve of such contracts as Mr. Finlay has with his local unions?

Mr. BERRY. No; I do not; for the very fact, as Mr. Finlay has indicated, the International Typographical Union has declined to underwrite the agreement in Boston, for the very fact that it carries with it an open shop clause.

Commissioner WEINSTOCK. Can a local union enter into an agreement that is not ratified by the International Typographical Union?

Mr. BERRY. Not under our laws, but contrary to the general understanding of the trade unions, there are a few of them who do not precipitate trouble, and in that our unions have progressed reasonably well under it, I am willing to acknowledge that we have shut our eyes to the Boston contract.

Commissioner WEINSTOCK. That is, you have worn blinkers?

Mr. BERRY. Something like that.

Commissioner WEINSTOCK. If, by virtue of that contract, your local union in Boston should get into trouble with Mr. Finlay's company and should go out on a strike, would they look for support, moral or financial, at the hands of your union?

Mr. BERRY. While I do not believe there is a possibility of trouble in Mr. Finlay's office, yet I would not like to answer that for the fact Mr. Finlay would have the four aces.

Commissioner WEINSTOCK. Under Mr. Finlay's agreement, as I understand it, he would be at perfect liberty to-morrow, without violating any agreement, to drop out every union man in his service and replace him by a nonunion man?

Mr. BERRY. Yes, sir; as long as he paid the wages.

Commissioner WEINSTOCK. You do not approve of that kind of contract?

Mr. BERRY. No; it is impractical and can not stand.

Commissioner WEINSTOCK. You are simply tolerating it?

Mr. BERRY. Locally we have been advised that it exists; but officially we know nothing about it.

Commissioner O'CONNELL. You will wake up some day and find out it does exist.

Mr. BERRY. That is the reason I did not want to answer Mr. Weinstock's question.

Commissioner WEINSTOCK. I have always understood that the typographical union—that is, the printers' union—stood in the front rank for character, intellectuality, and standing among the unions of the country. What protection under these circumstances, has an employer in dealing with a high-class organization if—as was brought out here in the testimony—its duly appointed representative—I understood Mr. Higgins was president of the pressmen's association?

Mr. BERRY. Yes; he was my predecessor.

Commissioner WEINSTOCK. Then he represented the highest type of the union men in your organization. What protection would an employer have if, in dealing with the highest representative, who also is supposed to represent the highest standard in the organization, in entering into an agreement with such a representative in good faith, his organization throws that agreement down?

Mr. BERRY. I think it was a display of bad business on the part of the typhotetæ for the very fact that the typhotetæ was aware—there is no question about it, because it was a matter of general discussion throughout the continent—that that contract was unsatisfactory. It was not bringing results; it was not meeting the expectations of the membership, and they were dissatisfied with it. It was published generally, circulars were issued condemning it, and the typhotetæ knew, beyond any question of doubt, that it did not meet with the approval of the membership—that is, a certain portion of the membership. There was no way for them to know whether it met with the approval of the majority or not. The typhotetæ's position should have been, in making the contract with Mr. Higgins, to have said to that representative of the union: "Here, we are advised as to the dissatisfaction of this membership. We want a bona fide contract. We want a contract that carries a sense of mutuality between the parties to it. We are going to take this contract," which they did, "to our convention for their ratification. When we take it to our convention," which they did, "and ratify it, we will know our membership is in accord with it. We want you to do the same thing, and we want you to bring back to us a contract that we know will be acceptable to your organization as a result of this negotiation." They knew of the dissatisfaction. Mr. Higgins unquestionably, as I have already stated, advised them that he had the authority. From his interpretation, possibly he thought he had the authority. I am confident, too, that—from his experience as the president for years—he thought he could get it ratified. But that was taking a gambler's chance for the very fact, in addition, the courts of the country decided that there was not a basis for authority, and in addition to that the convention, by an overwhelming majority decided that he could not get it ratified and that he did not have the authority. In my opinion that fault was just as much with the typhotetæ as it was with the union representatives.

Commissioner WEINSTOCK. That might be so, of course. When was that agreement entered into?

Mr. BERRY. They proceeded to negotiation immediately after the convention of 1906.

Commissioner WEINSTOCK. What was the date of that agreement? When was it signed by Mr. Higgins?

Mr. BERRY. It was to go into operation May 1, 1907.

Commissioner WEINSTOCK. And it was agreed upon when?

Mr. BERRY. I do not remember that. I did not negotiate it.

Commissioner WEINSTOCK. Do you remember the date of the agreement, Mr. Finlay?

Mr. FINLAY. I think it shows there in the copy of the agreement which you have, Mr. Weinstock.

Commissioner WEINSTOCK. It says, "made and entered into this 8th day of January, 1907."

Mr. BERRY. That is right.

Commissioner WEINSTOCK. It was to go into operation May 1, 1907?

Mr. BERRY. Yes; and to extend for a period of five years.

Commissioner WEINSTOCK. Here is a communication from Mr. Higgins, dated February 8, evidently several weeks after the time of the entering into the agreement, where he says, addressing the secretary of the typhotetæ:

"MY DEAR Mr. MACINTYRE: Your letter informing me that the United Typhotetæ of America, at a special session of that body held at Pittsburgh, Pa., on Saturday, February 2, ratified the new agreement made between their committee and our board of directors to hand.

"I have attached your letter to the original agreement made between both our committees at Philadelphia on January 8 last, as the action of your special convention in ratifying the agreement.

"I reecho the wish expressed by you in your letter of information on the matter, and trust that both our organizations will enjoy a long experience of friendly relations and mutual advancement and progress under its provisions. With regards, I am,

"Very truly, yours,

"MARTIN P. HIGGINS, *President.*"

You see, the thing had gone so far that the employers had approved the agreement and had notified your president and he had acknowledged it and practically led them to feel that it was satisfactory and would go on. This apparently was not entered into by Mr. Higgins's firm, but also by others of your officials, John G. Warrington and Edward W. Gordon, William L. Murphy and William J. Webb.

Mr. BERRY. But there was one of the board that refused to sign—the first vice president.

Commissioner WEINSTOCK. It would seem to me it is perhaps well to have this brought out, because there are untold numbers of employers who contend it is useless to enter into agreements with organized labor because they are not dependable, they are not contract keepers; and we want to bring that out as clear and sharply as we can, for their information and for ours.

This contract having been entered into, seemingly in good faith on both sides, even though assuming that your committee had exceeded its powers, as a matter of wise policy and in order to retain the confidence of the employers of the country, and retain the confidence of the public, would it not have been wise to have stood by the contract, good or bad?

Mr. BERRY. You can not make a contract unless there is a mutuality between the parties to it. It is not a contract. I can not make you take a contract; otherwise it would not hold water.

Following up the broad principle that you lay down, I am free to say to you that that was the general attitude that I took, provided—*provided* that the typhotetæ was willing to exercise the same broad conciliatory position. There was no question—it was clearly proven, and there is not a doubt in the world from the records but what these four men signed the agreement for 20,000 men at that time without their consent, and exceeded their authority and right. There is no question in the world about that. That has been determined beyond all question of possibility. But before that was even determined, before we even assumed the arbitrary position of deciding whether it was a contract or not, before the courts had determined whether we were right or not, what did we do? By action of our convention we said, "These fellows have gotten us into a bad situation, and we want to maintain a peaceful relationship with the typhotetæ. We are willing to forego the matter of the eight-hour day another year and a half in order to maintain peaceful relationships. But we can not accept that part of the agreement that has vitiated and undermined our organization in the past five years. We have been deteriorating in our organization. We have been losing our people all over the Continent. If the typhotetæ is willing to meet us half way on this proposition, we will meet them half way." Our convention instructed its board to go to the typhotetæ and say, "If you will take out that clause—we do not ask you to put in there specifically that you shall employ nothing but union men—but if you will simply

take out that clause giving you the right to employ nonunion men to our detriment, we will get along with you."

Commissioner WEINSTOCK. Query: Were the employers in any way informed as to the limitations of power given to that committee?

Mr. BERRY. Mr. Weinstock, the United Typothete, its executive officers—I think Mr. Finlay's partner, Mr. George H. Ellis, was president at that time—know our constitution and our by-laws and our American pressmen and our general affairs just as well as I do. Of course they knew. They know all about us, because everything we do is open.

Commissioner WEINSTOCK. Apparently members of this conference did not know it, because here is a question put:

"The PRESIDENT. Gentlemen, a practical question was asked here yesterday that I think Mr. Higgins can answer better than anyone else and to the satisfaction of us all, and it would settle it once for all; that is, What power is given to your committee? I take it that that is a question that you are now perfectly ready to answer. If there is any hesitation, I will not ask it.

"Mr. HIGGINS. I will tell you right off the reel. The committee have got unlimited power. If in the judgment of the committee they think they have got a good thing they will close it up; if not, we will submit it to the membership. [Great applause.]

Mr. BERRY. Certainly; why not?

Commissioner WEINSTOCK (continuing):

"The PRESIDENT. Mr. Higgins has shown his ability to answer a question directly. Is there any other pertinent question? We can imagine a lot of impertinent ones that you and I would like to ask Mr. Higgins. We will refrain. Is there any other pertinent question that would help us in our deliberations that you gentlemen would like to ask Mr. Higgins that he would feel at liberty to answer?"

If I was an employer and you came representing the workers and I had every reason to have every confidence in your statement and you made that statement unqualifiedly, I surely would feel that your organization would stand behind you, and if they did not I think I would lose all confidence in you and your organization.

Do you not think it would be the height of business judgment, however? You know what you want; you do not have to call a special meeting to get your idea as to whether you will pay the money or not pay it. You are the other half. Mr. Higgins was not running presses, mind you; Mr. Higgins was the president of this union and the negotiating factor; that is true; but don't you think it would have been the height of good business judgment to have said, "Now, we will agree upon this plan, but you do what I am going to do; you do what I am going to do. I am going to get the consent and approval on this proposition of the people that are going to pay the money. Now, you go to your convention or your members and you get their approval of this, and then we will know where we are at."

Commissioner WEINSTOCK. That would be right if you said, "My powers are limited; I can only enter into an arrangement with you subject to the approval of my organization;" but if you go forward and state, "I have unlimited power," unless I had no confidence in you I would accept your statement.

Mr. BERRY. Let me tell you this: The labor movement on this continent and the pressman's union have attained that point where they will not accede to any one man or a dozen men's demands, or the idea of a man presuming to say, "We will take a good thing if it looks good and go the whole thing, hook, line, sinker, and all." That does not stand with the dignity and stability of the International Printing Pressmen's Union; that don't go; we don't do business that way any more.

Commissioner WEINSTOCK. Are we to understand that the representatives have only limited powers?

Mr. BERRY. We understand that our representative has to follow the laws and instructions, and he did not follow the instructions.

Commissioner WEINSTOCK. Whatever agreements they enter into are subject to the approval of the body?

Mr. BERRY. Absolutely; and the instructions of the convention at Pittsburgh were specific, and they disapproved—well, not disapproved, but failed to comply with the specific instructions of the convention. What do you think, that 20,000 people are going to live up to things that three men sign away without their consent and in violation of their orders? That would be a pretty easy

business for some labor skates, if they could arbitrarily direct the affairs of 25,000 or 30,000 people.

Commissioner WEINSTOCK. Did I read this right, "That there was a renewal of a contract that had two years," etc.?

Mr. FINLAY. With the exception that we provided for an eight-hour day, and they knew it.

Commissioner WEINSTOCK. That is, the new contract was precisely the same as the preceding contract, with the exception of the difference in hours?

Mr. FINLAY. Yes; but it was not a new contract; it was not a new proposition to put up to them. It was a renewal of a contract.

Commissioner WEINSTOCK. With a change in the working hours?

Mr. FINLAY. In 1909, negotiating for an eight-hour day. There is nothing new to it.

Mr. BERRY. There were only one or two minor changes.

Commissioner O'CONNELL. Did that provide for an open shop?

Mr. BERRY. Yes.

Commissioner O'CONNELL. What did the Pittsburgh convention instruct them to do?

Mr. BERRY. To meet with them under certain conditions and they went out and renewed this whole contract.

Commissioner O'CONNELL. For instance, not to include the open shop?

Mr. BERRY. Of course. That was the basis of Judge Thompson's decision. That convention throughout these entire proceedings indicated in every move and utterance that they would not tolerate another contract with that clause in it, and in addition to that, as Mr. Finlay has read, it specifically states that negotiations shall be opened and the wage scale shall become effective one year after it is settled.

My goodness alive! We did not get a dozen increases in wages in the whole of the five years of its existence, across this continent.

Commissioner O'CONNELL. But at the time of this convention they knew the action of your Pittsburgh convention, that it should not enter into that clause?

Mr. BERRY. I presume so. I do not know that they were officially notified of the fact. According to Mr. Higgins's statement, they were not, but that certainly was the basis of Judge Thompson's decision to the court of appeals, and Judge Lurton, associate justice here at the present time, wrote the decision for the United States Court of Appeals, and decided every point in our favor.

Commissioner WEINSTOCK. If I, as an employer—as a merchant, for example—sent out a salesman to represent me in the field, and that salesman exceeds his authority and quotes prices and enters into conditions that are not agreeable to me, I will punish that salesman all right, probably by dismissal, for having exceeded his authority, but I will make good with the customer.

Mr. BERRY. That is an entirely different proposition, sir, the question of dollars and cents in the sale of a pair of pants, to the question of bread and butter and the existence of an organization of workingmen and working women on this continent—quite different.

Commissioner WEINSTOCK. I ought to penalize a salesman that will not obey orders, and the union should penalize a representative that did not obey their orders, but it ought not to penalize the other fellow.

Mr. BERRY. Well, they did that.

Commissioner O'CONNELL. Well, Higgins lost his job?

Mr. BERRY. Yes; Higgins lost his job; but I will say this—let me declare this point again: We were not prepared, as the result of this miscarriage of instructions and justice, in fairness to swallow it hook, line, and sinker, in the slang of the street, but we were prepared, and the records show that we were, to swallow the hook and the line, if the other fellow would swallow the sinker, but he would not do it. We were willing to go along five years under that agreement with the nine-hour day, and continue that for another year, and go through all the rigmaroles that we had before the wage scale should become effective, and agree not to apply for a wage scale only every three years, and all that tommyrot, if they would simply say "We will not insist upon putting a provision in here giving us the right to discriminate against your people."

Mr. FINLAY. May I ask Mr. Berry one or two questions?

Commissioner WEINSTOCK. Certainly.

Mr. FINLAY. As I understand it, a union shop requires a union foreman?

Mr. BERRY. Every man, from the foreman down.

Mr. FINLAY. Well, I want to make a donation of \$10,000 to your home if you can produce that foreman in my shop.

Mr. BERRY. You are the man that made the statement. You said, "I employe the other people, and I think Mr. Berry will say so when he is on the stand."

Mr. FINLAY. Buf you said in testimony here that I ran a union shop.

Mr. BERRY. Well, I am taking your word for it.

Mr. FINLAY. I want to ask you one thing: Do the membership in your organization, or did they in the three years of that contract, decrease?

Mr. BERRY. They decreased, as I stated here very explicitly, of course, in comparison to the growth of the industry.

Mr. FINLAY. Mr. Higgins made a report to our committee that contrary to the expectation of a good many of the active members of your association, the increase under the membership agreement for the three years that it was in vogue was larger than any other three years in the history of the pressmen's union.

Mr. BERRY. Well, now, just to show you, if it won't take too much time—

Mr. FINLAY. I don't want to take your time.

Mr. BERRY. Mr. Higgins is from Boston, too, but that is all right. Let me give you a comparison. Here are the figures, and you and Mr. Weinstock had better understand my position, possibly.

During the five years of the typhothetæ agreement—follow me closely, now—

Commissioner WEINSTOCK. From what year to what year?

Mr. BERRY. Up to May, 1907, up to its expiration; five years, at any rate, under Mr. Higgins, the membership in this international union, covering the Dominion of Canada, increased 1,682 members, and the five years immediately following 1907, after the repudiation of this so-called union-building policy, the international union gained over 10,000 members on this continent.

Mr. FINLAY. Now, you say you don't believe in the Boston agreements, or the way they are negotiated?

Mr. BERRY. The matter of the negotiations I think is all right; the procedure is in accordance with my ideas.

Mr. FINLAY. Don't you think it is a good union movement?

Mr. BERRY. But the provision for an open shop, the nonunion clause, I think is absolutely impracticable from that point of view, and you have made my case here by comparing Worcester.

Mr. FINLAY. I read in a paper the other day that Mr. O'Hara made the statement that there was not a member of the organization out of work; that every man is at work. Now, you said that the contract the pressmen's union made they made with my company.

Mr. BERRY. I said your local typhothetæ.

Mr. FINLAY. You said my company, did you not, Mr. O'Connell?

Commissioner O'CONNELL. Yes.

Mr. FINLAY. We do not make any contracts with the unions; we make them with the typhothetæ.

Mr. BERRY. Well, I want to correct that record.

Commissioner O'CONNELL. Of course there is quite a difference.

Mr. FINLAY. Yes; it is quite a difference with a person who contends that he is running an open shop, and makes the statement that he is making a contract with the union.

Commissioner O'CONNELL. What is the difference if I make a contract with them or with you, if it amounts to the same thing?

Mr. FINLAY. If I made a contract with you individually—a contract with a union—I would be pretty nearly making a union shop.

Commissioner O'CONNELL. Are you not running under a contract made with the union?

Mr. FINLAY. Only as to hours or wages.

Commissioner O'CONNELL. But are you not running under a contract with the union?

Mr. FINLAY. Only as to hours and wages.

Commissioner O'CONNELL. No matter what, it is under that contract?

Mr. FINLAY. I am running the press department, yes. That is a matter of opinion between you and me, which we disagree on.

Commissioner WEINSTOCK. Another point of information: You did not enter into a contract as a company with the union?

Mr. FINLAY. Absolutely not.

Commissioner WEINSTOCK. That is done with your association?

Mr. FINLAY. The association.

Commissioner WEINSTOCK. You have a collective contract?

Mr. FINLAY. We have a collective contract.

Commissioner WEINSTOCK. And you are simply a party to that collective contract?

Mr. FINLAY. We are simply a party to that contract. I happened to be chairman of the committee that negotiated it.

Commissioner WEINSTOCK. There are not as many independent contracts written as there are members of the association, are there?

Mr. FINLAY. No.

Commissioner WEINSTOCK. Just one contract that covers them all?

Mr. FINLAY. Yes; and these printed scales are in here as exhibits, showing how they are made.

Commissioner COMMONS. With reference to that agreement, it seems to me, as I understand it, that you were using the two words in a different sense. For example, you say that his shop is a union shop, and yet his agreement is an open-shop agreement. Am I right; is that the distinction you make? I want to get at this definition.

Mr. BERRY. No; he said he had an open shop, employing only members of our union. I quoted him.

Commissioner COMMONS. At the same time, in commenting on that, you said that is what you would call a union shop.

Mr. BERRY. A union shop is a shop that employs only members of the organization; that is a union shop.

Commissioner COMMONS. But at the same time you declined to approve of that agreement because it is an open-shop agreement?

Mr. BERRY. Exactly, but the fact that Mr. Finlay may be employing, as he is, only members of our organization, does not mean that all the typothetæ of Boston are employing members of our organization, and it does not mean that Mr. Finlay has to employ members of our organization.

Commissioner COMMONS. The only difference is that the agreement is a typothetæ agreement, whereas his shop is a union shop?

Mr. BERRY. Yes; as it would happen under this open-shop agreement, Mr. Finlay has a union shop.

Mr. FINLAY. I deny that absolutely. I deny it, absolutely.

Commissioner COMMONS. What is your point of denial?

Mr. FINLAY. I claim that we have not got a union shop. I hire what I want to, and he said that the foreman of the ship is a union man, and I told him that I would make a donation to his Tennessee home, when he said a union shop has to have a union man for a foreman. I deny that absolutely.

Commissioner COMMONS. Then it is largely a matter of terminology, and I should think both of you would be well satisfied with the situation. He has got a union shop and you have got an open shop, and you both ought to be satisfied.

Mr. FINLAY. I am satisfied if you understand it my way, but I am not if you understand it his way, and as to arbitration, we can arbitrate everything but international laws, and we can not arbitrate them.

Commissioner O'CONNELL. I think I will have to go over to Boston and see the shop.

Mr. FINLAY. Glad to have you.

Commissioner COMMONS. Do you desire to make any statement further, Mr. Finlay?

Mr. FINLAY. I would like to.

Commissioner WEINSTOCK. Just one more point, to make it clear in my own mind. I imagine you have exactly the same kind of contract with the locals that your national objected to, nationally.

Mr. FINLAY. Absolutely repudiated. I would like to make that clear.

Mr. BERRY. No; not repudiated.

Mr. FINLAY. It has worked out.

Mr. BERRY. That is better. We do not repudiate contracts.

Mr. FINLAY. I would like to state this to the commission. We have a composing room which has the larger part of our members. We have no agreement with the typographical union, and we employ men and women in that room and pay the union scale of wages, and that is run as an open shop, and that every member of the Boston Typothetæ runs an open shop; I leave that to the commission.

Commissioner WEINSTOCK. Do you pay the women the same price in the shop?

Mr. FINLAY. If they do the same work they get the same pay.

Commissioner WEINSTOCK. Do they set type?

Mr. FINLAY. They don't set type nowadays, only by machine; they do not get the same price for correcting, but they get the scale agreed upon by the union with the preferential union shop.

Mr. BERRY. I just want to make this statement: I hope that at some future time, if this commission desires, I will be privileged to take up with you the affairs of our organization in the matter of industrial trade education and efficiency. I want to say, for the record, that 65 per cent at least of our membership receives a compensation in excess of the minimum wage, and it is the result of our active interest in trade education. We have now an institution valued at \$133,000, a trade school which we maintain, and I am going to extend to this commission an invitation to visit that trade school, the press work; and in general line with what I have said here in the matter of collective bargaining, and the matter of the extension of the Erdman Act or some similar act, I have prepared a paper which I would like to submit in connection with my testimony, and in addition to that I want to say that if there is anything, records, contracts, any detail whatsoever as regards the operation of our union, a request from this commission will bring it forth without delay.

Commissioner COMMONS. We accept with pleasure, and will file your brief.

(The paper referred to was filed by Mr. Berry with the commission, and is as follows:)

[Paper submitted by George L. Berry, president International Printing Pressmen and Assistants' Union of North America, to the United States Commission on Industrial Relations, Washington, D. C., on the question of collective bargaining, conciliation, and arbitration between employers and the organizations of working men and women.]

The question of the proper relationship between employers and employees is one that embraces many important phases of industrial activity. It would be the height of presumption upon my part, therefore, to attempt to burden the United States Commission on Industrial Relations with my version of the necessary responsibilities of employers and employees. In conformity with the request of the commission, however, I prepared and submit herewith certain concrete views which I trust will be of assistance in the establishment of a more cordial and cooperative relationship between the units of industry in the United States.

The organized labor movement has for its basic principle the purpose of collective bargaining. It is apparent to all without minute explanation that it is decidedly more effective for all of the workingmen of a given industry to act jointly in the presentation of their grievances than it would be for each person to act individually in the matter; hence the existence of organized labor and its policy of economic advancement.

The collective interests of the employees bargaining with the collective interests of the employers is more desirable than the collective interests of the employees dealing with individual employers. This is so not only because of the prompt facilities that would follow in establishing the points at issue but it is moreover essential because of the uniformity of action that inevitably follows through joint bargaining relationship. For example, if a peaceful adjustment is not arrived at, a uniform cessation of relationship is followed; if, on the other hand, a mutual adjustment is made, a uniform condition is established and maintained during the period of relationship, be it contractual or verbal, and this phase of the situation is of material importance to the units of the industry. By units I refer to employer, employee, and those dependent upon the industry for their livelihood. The main feature of importance, as I see it, evolves in the natural and inevitable competitive conditions that will follow.

Labor is the chief cost of industry. It is, of course, the most important phase of industry over and above its importance from a cost point of view and the very fact that labor represents human effort, responsibility, and assistance. It is reasonable to say, therefore, that the matter of competition is of serious moment to the well-being of the employees as well as to the employers. If employers are to deal with their individual workingmen, either as union or non-union mechanics, then the condition of an unhealthy and unnatural competition must follow, for the characteristics of human nature have proven many times to be irregular, and irregularity in this sense would mean a diversified wage condition, which would further precipitate an irregular competitive cost for labor, which would still further establish an irregular base cost and scale of competition. The organized labor movement therefore endeavors to maintain a living minimum wage with a view of protecting its members first, and second

protecting its industry against adventurers therein, or that class of employers who make their profit from exploiting labor and who save their losses through the reduction of wages.

The question of the minimum wage as maintained by the collective action of working men and women is a movement, as I have already indicated, that has for its purpose the establishment of a rate of compensation that would maintain the employees in an environment of respectability, and further that every employer might at least be in possession of the fact that his competitor could not raise the cost labor below the minimum figure established. Beyond those two points, organized labor then advances its cause upon the principle of increased efficiency and business cooperation.

At least 65 per cent of the membership of the International Printing Pressmen and Assistants' Union receive a compensation in excess of the minimum established throughout their organization. This additional compensation over and above the minimum represents the degree of effort and the effect of the organization in the promotion of its general policies of increased efficiency.

For the foregoing reasons, primarily, statistics prove that in the commercial industry of this country, particularly where the organizations of the employees and the employers are jointly the strongest, the industry is more prosperous and the profits thereof more equitably distributed. On the other hand, where the workers are poorly organized the employers are also disorganized, and the results are uniformly unsatisfactory from a business point of view. This condition is effective because of the small likelihood of combinations or corporations, it not being possible for a trust to exist in the commercial printing industry.

In harmony with the general principles as aforementioned, the best mode of procedure in the negotiation, the establishment, and the maintenance of agreements finds expression through international organization of workingmen and women and international associations of employers of a certain given industry. My statement in this regard is based on experiences we have had in our relationship with employers. With an international agreement covering a local society of employers and a local organization of employees there is a double means found in the establishment of responsibility. The international relationship of both organizations is more generally inclined to an adjustment of differences amicably than would possibly be the result if situations were left to local organizations of a contesting nature.

The International Printing Pressmen and Assistants' Union has at various times held international contracts with the United Typothetæ of America, the American Newspaper Publishers' Association, and the Printers' League of America. The first and last named organizations of employers exercise organization activities in the commercial printing industry alone, the American Newspaper Publishers' Association having its relationship with daily and weekly newspapers alone.

The contract with the United Typothetæ of America failed to meet the requirements of the commercial industry—was not responsive to the interests of the industry—because the contract, in the first instance, was predicated upon a theory that denied the principles of collective bargaining or the maintenance of the principle of a community of interest. As has already been indicated by me, it is my opinion that there can be no equitable or amicable relationship or assurance of the conservation of our industry except through the assistance of the organized workers and their recognition by the employers. In the case of the United Typothetæ of America's contract the employers insisted—and it was acceded to by the union for a number of years—that the contract should retain a clause in it that would give to the employers the right of discriminating against a union man or a nonunion man as he might determine. If the organizations of the workers closed their doors against the nonunion workers, then there would be some justification for the idea as offered by the United Typothetæ, but the facts in the case are that organized labor expends more of its energy and income endeavoring to bring into its ranks the unorganized worker than through any of its business operations. Its sum total purpose is to advance the principle of collective bargaining, community of interest, the increasing of efficiency, and the advancement of the industry as a whole.

The contract of the United Typothetæ failed because of its lack of community of interest; it failed because of the possibilities arising from specific provisions therein which made it optional with the employer to retain the services of union men or nonunion men as the employer might determine. In other words, such a contract could have but one effect, that of systematically destroying the organizations of the employees. This feature vitiated any possibility of mu-

tuality and conciliation or arbitration under it and failed as result of that lack of confidence.

The Printers' League of America, which has succeeded in a measure the United Typothetae of America as an employers' organization in the commercial industry, has profited by the experiences of the United Typothetae, and in the very first section of the agreement the broad principles of community of interest are set forth, and it reads:

"SECTION 1. In consideration of the Printers' League of America agreeing to employ none but members of the International Printing Pressmen and Assistants' Union to do work that comes under the jurisdiction of said International Printing Pressmen and Assistants' Union, the Printers' League of America (and its branches) shall have the following guaranties:

"(a) All members of the Printers' League shall be protected under this contract by the International Printing Pressmen and Assistants' Union against walkouts, strikes, boycotts, or any other form of concerted interference with the peaceful operation of the departments over which the International Printing Pressmen and Assistants' Union exercises jurisdiction.

"(b) All disputes arising over scale provisions, wages, hours, and working conditions or renewing or extending contracts shall be subject to local arbitration under the provisions of this agreement, if such disputes can not be adjusted through conciliation.

"(c) The International Printing Pressmen and Assistants' Union shall at all times furnish sufficient competent help for the needs of the members of the Printers' League of America, but should it fail to do so, then, and then only, until such time as the help required by the member or members of the Printers' League of America shall be furnished by the International Printing Pressmen and Assistants' Union, said member or members of the Printers' League of America shall be privileged to seek the necessary help elsewhere: *Provided*, That the prevailing scale of wages is paid.

"(d) The International Printing Pressmen and Assistants' Union further agrees that in cities where branches of the league are formed it will not permit its members to do the same class of work in nonunion shops except by mutual consent. Nor will it allow its members to work for a less wage scale or for longer hours than the scale and hours accepted by the branch league.

"SEC. 2. If conciliation between a local union fails, then an appeal to a local board of arbitration may be had, as provided in the form of local contract recommended and attached hereto, and its decision shall be final unless appealed to the national board of arbitration, as also provided in said local form of contract. (Sec. 6C.)

"SEC. 3. The national board of arbitration shall consist of the president of the Printers' League of America, or his proxy, and the president of the International Printing Pressmen and Assistants' Union, or his proxy. In the event of failure of the above board as constituted to agree upon an adjustment, they are then empowered to select a disinterested person who shall act as a member of the board. This board shall then proceed to render a decision as quickly as circumstances will permit, and the decision so rendered shall in all cases be final and binding upon both parties to the controversy.

"SEC. 4. The national board of arbitration shall be under no obligation to take evidence, but do so at its option, but both parties to the controversy may appear personally or may submit records and briefs and may make oral or written arguments in support of their several contentions. They may submit an agreed statement of facts or a transcript of testimony, properly certified to before a notary public, by the stenographer taking the original evidence or depositions.

"SEC. 5. Pending final decision work shall be continued in the office of the member of the printers' league party to the case, and all conditions obtaining before the initiation of the dispute shall remain in effect; and the award of the national board of arbitration shall in all cases include a determination of the issues involved covering the period between the raising of the issues and their final settlement; and any change or changes in the wage scale of employees may, at the discretion of the board, be made effective from the date the issues were first made.

"SEC. 6. The national board of arbitration must act when its services are desired by either party to an appeal as above and shall proceed with all possible dispatch in rendering such services.

"SEC. 7. All expenses attendant upon the settlement of any appeal or hearing before the board shall be adjusted in each case in accordance with the direction of the national board of arbitration.

"SEC. 8. The rules and regulations, in addition to the provisions above quoted, shall be identical with those found in the recommendations for the form of local contract for the proper method of procedure and number therein under section 2, as 1, 2, 3, 4, 5, 6, 7, and 8.

"SEC. 9. In the event of either party to the dispute refusing to accept and comply with the decision of the national board of arbitration, all aid and support to the firm or employer, or member or members of the union, refusing acceptance and compliance shall be withdrawn by both parties to this agreement. The acts of such employer or member of the union shall be publicly disavowed, and the aggrieved party to this agreement shall be furnished by the other party thereto with an official document to such facts."

In every instance where controversies have arisen between locals of the International Printing Pressmen and Assistants' Union and locals of the Printers' League of America amicable adjustments have been the result. There is but one weakness that can possibly be sighted against the contract of the International Printing Pressmen and Assistants' Union with the Printers' League of America, and that is the question of arriving at an adjustment in the event of failure to agree upon the third man of the national board of arbitration. I shall touch on this phase of the situation again before completion of this paper.

The contract of the International Printing Pressmen and Assistants' Union with the American Newspaper Publishers' Association, which has expired, met with the same general satisfaction as did the contractual relationship referred to above as existing between the International Printing Pressmen and Assistants' Union and the Printers League of America. One great difficulty, however, and defect existing in the agreement with the American Newspaper Publishers' Association was found in the declination of many of the members of the American Newspaper Publishers' Association to join in contractual relationship. In other words, they retained their membership in the American Newspaper Publishers' Association but refused to become parties to the contract in so far as it applied to relationship with the unions, and further maintained their right to participate in its construction. This fact to no small degree minimized the value of the contract between the American Newspaper Publishers' Association and the International Printing Pressmen and Assistants' Union. I am creditably informed that this defect exists in the relationship of the publishers' association with other international printing-trades unions.

The effect of the publishers' attitude, as indicated above, finds expression in the lockout of the web pressmen in the city of Chicago on May 1, 1912. This is possibly the most serious difficulty that has arisen in the newspaper industry for a great many years, and it was in no small degree due to the failure of the American Newspaper Publishers' Association to compel its members—the newspapers of Chicago—to act in harmony and come under the provisions of the international arbitration agreement with the International Printing Pressmen and Assistants' Union. For example, the local publishers of Chicago, holding a local agreement providing for conciliation and arbitration, for over two years succeeded in evading the demand of the union to go to arbitration looking to the advancement of a wage scale that had been effective for about seven years. The local publishers could very readily assume this position because of the lack of responsibility exercised over the local publishers by their national association. In other words, while the American Newspaper Publishers' Association held a national contract with the International Printing Pressmen and Assistants' Union, they permitted their Chicago membership to act individually, and at the same time the Chicago association was dealing with a subordinate body of the International Printing Pressmen and Assistants' Union.

The matter of procedure under the publishers' contract in conciliation, local arbitration, and national arbitration was, in the main, identical with that of the Printers' League of America contract already referred to.

The labor movement in general, and especially the printing-trades unions of America, stand committed to the principle of the adjustment of difficulties by the means of conciliation and arbitration. It is not the inclination or desire of the printing-trades artisans of this continent to participate or precipitate in a strike or lockout or in any other concentrated movement that would involve the stability, success, and prosperity of the printing industry, and I am confident that the majority of the strikes and lockouts that have taken place in recent years in the printing industry have been more as the result of a misunderstanding than from any practical reason. The International Printing Pressmen and Assistants' Union is classified as being the most militant of the five international printing-trades unions; the records show, however, that, with the ex-

ception of the eight-hour-day campaign in 1907, there have been less than 20 strikes called throughout the entire jurisdiction of North America, with about 400 subordinate unions.

The best indication of the desire of the printing trades unions for peaceful relationship with employers of the printing industry, and their willingness to embrace the principles of conciliation and arbitration is conclusively evidenced in the recent international federated agreement entered into by the representatives of the five international printing trades organizations. This agreement is primarily a peace compact not only as it affects the relationship of the unions with each other but particularly as it affects the relationship of the unions and the printing industry. The fundamental principle of the federated agreement is predicated upon the idea of conciliation and arbitration; for example, the five international unions agree that where a dispute arises with an employer and a subordinate union of any of the five international bodies, representatives of those international unions are required to meet with the employer and endeavor to adjust the difficulties amicably by conciliation and arbitration. It has been further agreed to by the representatives of the five international printing trades unions that individual contracts made shall carry a clause providing that where a dispute arises between any of the subordinate unions of the five international organizations and where the employer refuses conciliation and arbitration, that then under such conditions the contract becomes null and void. This is the clearest indication of the real purpose of the proposed printing trades federated contract, and it is apparent to all that it rests upon the principle of peaceful relationship by and through the measures of conciliation and arbitration.

Reference has already been made in this paper to the difficulties that have arisen and the possibility of them in the future as regards the question of agreeing upon an unbiased odd member of arbitration boards. The possibility for delay in arbitration proceedings, and the experiences we have had as result of delays in the past have dissipated to no small degree the employees' confidence in conciliation and arbitration. This has been overcome somewhat, however, by advanced agreement that upon the settlement of a dispute the conditions arrived at should become effective on the date of raising the dispute. This arrangement, as I have already indicated, has in the main been voluntary. No specific requirement that this be a condition has ever been established in the printing industry; our agreements have only contemplated such a course if the arbitration board so desired.

From the result of international relationship with employers' associations I feel that strikes and lockouts and general disturbances in the printing and newspaper industry would be almost entirely eliminated by the establishment of an agreement that would contemplate the following:

First. An agreement jointly embracing all of the organizations of the industry and employers of the industry.

Second. The agreement to provide for conciliation, local and national arbitration.

Third. The agreement to carry a clause requiring that upon the opening of negotiations for an increase or decrease in wages, or the change of working conditions, that such change arrived at should become effective from date of the raising of the issue or from the inception of negotiations.

Fourth. That the contract carry with it a clause requiring the five international unions and the employers to render joint assistance in the maintenance of technical schools for the advancement of the industry and the increasing of efficiency of the units therein.

Fifth. That the contract provide a board of general review representing the organizations and the employers of the given industry whose authority it will be to pass upon the matter of differences that fail of adjustment by conciliation and arbitration. The chief purpose of this provision is to make possible a further effort to arrive at an amicable settlement, and if then failure results, make possible the placing of the responsibility upon the party guilty of an unfair attitude.

The provisions as outlined above, in my opinion, will minimize to the lowest possible degree difficulties that have heretofore brought about the cessation of business; it would, on the other hand, increase the community of feeling; would harmonize cooperation and advance the commercial possibilities of the industry to a point more responsive to the requirements of those engaged in it. The further effect of such an arrangement would very quickly establish the fact that the success of the industry is essential to the employee as well as the employer.

There is but one additional suggestion that I could make, and that is in harmony with the assumption that the United States Commission on Industrial Relations is either to have a permanent existence, or from it a board is to be established as result of its investigations that will have for its purpose the furtherance of industrial peace and justice.

It is not compatible with the interest of free and voluntary organizations to suggest the practicability of compulsory arbitration; such a system would fail miserably, as has been the result in practically every instance where it has been given a test. It is my opinion, however, that if the duties of this commission were broadened, or some industrial board of the future was given the authority to investigate into industrial differences before or after a dispute, and preferably before, to exert efforts to prevent difficulty and to maintain a voluntary board to act where the contesting parties have failed to agree in the completion of an arbitration board, you would find that not only would the great majority of such disputes be presented to the Government board, but you would see in this future arrangement looking to peace another substantial reduction in wasteful industrial conflicts.

The organization of working men and women can not fail in its efforts to maintain an organization. The efforts of employers to destroy organizations of working men and women therefore constitute a policy of destruction rather than construction. Organized labor's willingness, as a general proposition, and with a growing tendency toward conciliation and arbitration, is manifestly sufficient in importance to justify the Government offering its persistent efforts and influence toward industrial peace and justice.

GEO. L. BERRY,
President I. P. P. & A. U.

APRIL 7, 1914.

(Whereupon, at 6 o'clock p. m., the commission adjourned until to-morrow, Thursday, April 9, 1914, at 10 o'clock a. m.)

AFTER RECESS—2 O'CLOCK P. M.

BUILDING TRADES.

Pursuant to the arrangement announced before the noon recess, the members of the commission selected to hear witnesses in regard to the building trades met at the rooms of the commission on the ninth floor of the Southern Building at 2 o'clock p. m.

Present: Commissioners Harriman (presiding), Delano, Ballard, and Lennon.
Present also for the commission: Mr. W. O. Thompson, counsel.

TESTIMONY OF MR. OTTO M. EIDLITZ.

MR. THOMPSON. Mr. Eidlitz, will you give us your name and business and your place of residence?

MR. EIDLITZ. Otto Eidlitz, New York City; I am a general contractor in the building business.

MR. THOMPSON. How long have you been in that business, Mr. Eidlitz?

MR. EIDLITZ. Thirty-two years.

MR. THOMPSON. Have you, in your capacity as a general contractor, had anything to do with collective agreements or trade agreements; for instance, that is, the New York arbitration plan?

MR. EIDLITZ. I was the father of it.

MR. THOMPSON. Of course, we have the document here, but for the purpose of the present hearing, will you state the substance of the agreement?

(The document referred to, "Decisions of the General Arbitration Board of the New York Building Trades, 1910," by Ross F. Tucker, was submitted in printed form.)

MR. EIDLITZ. You mean of the relation between employees and employers in the building industry?

MR. THOMPSON. The substance of the New York agreement, what trades it included, for what length of time it was made, what was the general purpose and scope of the agreement, and how long it lasted.

MR. EIDLITZ. Well, suppose we hark back, just for a minute. In 1884 was the first collective bargaining in the building industry, and that was made between the bricklayers and the mason builders, and since 1884 that board has

made their trade agreement—has had their trade-arbitration board ever since that time, and there have been only two arbitrations outside of the trade board, and there have been only three serious differences of opinion.

Commissioner DELANO. In 1884?

Mr. EIDLITZ. Yes; 1884.

Mr. THOMPSON. And during that time, Mr. Eidlitz, if you know, about how many matters were adjusted by arbitration?

Mr. EIDLITZ. By conciliation more than arbitration, right in the trade board. Well, of course, the early agreements in the trade conditions were made each year, and all the various disputes that you have heard mentioned that happened in trade conditions were adjusted in that way, without friction. Now, this applies, of course, only to the mason builders. That was from 1884 on. I have been sitting with that board continuously since 1887.

Mr. THOMPSON. What was the form of conciliation or arbitration which was instituted by that agreement with the mason builders?

Mr. EIDLITZ. Well, it provided, first of all, a wage scale; it provided that the men should not leave the works, or a member of the association, without the question in dispute had been brought to the board first for settlement, and then various other trade conditions of employment, which were added to from time to time, until the document is in its present shape.

Mr. THOMPSON. What particular form of arbitration or conciliation was then under discussion.

Mr. EIDLITZ. Well, in most cases the trade board consisted of an equal number from each side, one representative from each union of the bricklayers, and an equal number of employers, and in voting one had to vote from the opposite side in order to make the vote carry. In other words, you had to get somebody from the opposition side in order that the question should carry. Now, when we come to the question of the actual agreement—itsself, the making of the annual agreement, or, as it has been now, a four-year agreement, the last time we met it was tentatively passed in the meeting of the trade board, and then each union took it to its organization and voted on each article.

Mr. THOMPSON. In the matters which came up before this board of arbitration, from 1884 on, were there many instances of the discharge of employees, or allegations of discrimination against employees, either because they were members of the union, or the giving to employees of poor conditions of work—annual employees, discriminating against them in the matter of the kind of work or place of work?

Mr. EIDLITZ. There was very little of that because, you see, we don't go on the piecework system at all; we do so much an hour; we are on the hour basis, and each man, who is a union man, is entitled to what he does, whether he is laying front brick, or terra cotta, or rough brick, whatever he is doing. We are thoroughly in sympathy with it, but in our industry it is impossible to do without it. Of course, you might want to start with five men, and at the end of the week you might want to build it up to 150. We want skilled mechanicks. Now, there is just one way to get that.

Mr. THOMPSON. But, for the moment, to follow out this arbitration matter, as a matter of fact, in the building trades, when an employer is dissatisfied with a workman he simply lets him go?

Mr. EIDLITZ. Yes.

Mr. THOMPSON. And employs another union man?

Mr. EIDLITZ. Yes.

Mr. THOMPSON. And no question, as a rule, is raised about the discharge.

Mr. EIDLITZ. We don't allow it. A man gets his money, and he has got to do his work, and you can fire him if you don't like the way he wears his collar.

Mr. THOMPSON. That is the existing rule in the building trades?

Mr. EIDLITZ. That is the existing rule in the building trades.

Mr. THOMPSON. In the building trades you have got what is called by some people a "closed shop," have you not?

Mr. EIDLITZ. Absolutely.

Mr. THOMPSON. And the existence of the closed shop may be the reason why the other rule is instituted, that the employer may discharge without question?

Mr. EIDLITZ. That is probably so.

Mr. THOMPSON. And because of such conditions, questions of discrimination which arise in open shops and in factories, such as you heard mentioned, in reference to discriminations in regard to employers, and in regard to kind and character of work given, and so on, do not arise in your industries?

Mr. EIDLITZ. No; very rarely. There have been cases brought up, but not in the bricklaying end of it; but in some of the other trades where that question has been raised, but it is rare.

Mr. THOMPSON. But it is not the rule?

Mr. EIDLITZ. It is not the rule; it is a very rare occurrence.

Mr. THOMPSON. In consequence your board of arbitration has not been called on to deal with this class of cases to any extent?

Mr. EIDLITZ. No.

Mr. THOMPSON. And there has been no need, at least from that source, of immediate action?

Mr. EIDLITZ. No.

Mr. THOMPSON. Is it not true, as a matter of fact, that the board of arbitration or conciliation has to deal with larger problems and more large questions?

Mr. EIDLITZ. Very much more.

Mr. THOMPSON. Such, for instance, that if a decision was forced on either one side or the other by the introduction of an umpire, it would lead to the breaking down, possibly, of the arrangement?

Mr. EIDLITZ. Well, the idea advanced this morning by several of those who testified, that the umpire is more of a club, so that the contending parties should get together, that is true. In other words, when the employer and employee have been legislating together with the interest of the craft, they know exactly what is meant; they talk each other's language, and any outsider that comes in may go wrong one way or the other, with the best intent in the world, because he doesn't really grasp the problem; consequently that is why I tell you that in 32 years, as far as the bricklayers are concerned, there have been only two arbitrations, because, fearing that possibility, either one side or the other gave way rather than to have an umpire come in.

Mr. THOMPSON. But your provision provided for it?

Mr. EIDLITZ. Absolutely, and I might say in both instances where the employers forced the issue and insisted on the umpire, in both cases the employers lost.

Mr. THOMPSON. Then your statement even would bear out also the proposition that was made with reference to factories this morning, of Hart, Schaffner & Marx, that when the machinery gets to working well, and the people understand each other, while it is a good thing to have the umpire, the necessity of calling him in becomes less and less frequent?

Mr. EIDLITZ. Absolutely.

Mr. THOMPSON. But all the time the parties are aware of the fact that there is somebody who can decide if they do not agree?

Mr. EIDLITZ. Exactly.

Mr. THOMPSON. Of course, you are only speaking now of this one industry—the bricklaying industry?

Mr. EIDLITZ. Yes. Now, you understand, there are about 30 trades in the building industry, and I would like to explain that to you briefly.

Mr. THOMPSON. You can go right to that now.

Mr. EIDLITZ. In 1903 all the trades in the building industry were organized; they are closed shops, or were in 1903, and, due to the strength of organized labor on the one hand, and a certain laxity of certain employers' associations on the other hand, and a natural selfishness and cupidity of men in all business relations, a mode of procedure grew up there of grafting, which was so—grew to such an extent and became so that a number of leading employers in all the various industries made up their minds that they would never maintain their self-respect, and it became a question of proceeding in other ways, and we locked out the whole building industry, and we shut down absolutely in the city of New York. We organized in three weeks an employers' association, composed of the various industries in the building industry—that is, granite men, marble men, plumbers, steam fitters, carpenters, and all the various classes of trades that go to make up a building—and inside of three weeks we had 1,000 firms and incorporations in our organization.

Mr. THOMPSON. Binding each one?

Mr. EIDLITZ. Binding each contractor—each firm.

Mr. THOMPSON. To live up to the arrangement?

Mr. EIDLITZ. To live up to the dictates of the board of governors. That board of governors was formed, and bonds were placed, and contracts were placed inside of four months and inside of four months we were ready to do business. We took every one of these organizations and wiped them off of the face of the

map, and came out frankly and said that we would pay union wages, but that the graft proposition in New York had to stop, and we stopped it. We sent eight men up the river, and the whole proposition was handled without gloves.

Mr. THOMPSON. When you say eight men were sent up the river doubtless you mean the River Styx?

Mr. EIDLITZ. Well, Sam Parks passed over while he was there.

We then organized what is known as the joint arbitration plan and compelled every one of these organizations to come in. It took us six months to get one of them, but we got it, and we compelled every one of them to sign an agreement that they would take arbitration first and not strike first. It was a pretty severe fight, and it strained everybody pretty much, but since that time, although there have been discussions about striking and all that sort of thing, whenever the situation got really serious, whenever all remonstrances were unavailing, we simply did the other thing, we used a club.

You wanted to know what the situation is, and the relation between employer and employee. The way we look at it is this, that both sides should be thoroughly organized. All this transition period, the kindergarten game that you are going through in the garment trade, is preparatory. We are going through the first initiation. They were warned years ago what they would have to come to, but they would not believe it. All this preferential shop business is elementary. There is only one way to do it, to have both sides thoroughly organized, absolutely contractual relation, and then have a feeling that every act of one against the other must be tinged with apprehension. That is the relation between employer and employee. I have been at it for 32 years, and that is our result.

Mr. THOMPSON. Do you think that to-day, without organization, the attitude is not tinged with apprehension?

Mr. EIDLITZ. Do I think so?

Mr. THOMPSON. Do you think to-day, without the perfect organization you think of in the other lines of trade, that the relations are not tinged with apprehension?

Mr. EIDLITZ. Not so much; and you must not forget, that, taking the building industry as a class, they are about the highest grade of skilled men, and as individuals, both in education and everything else, as high as anybody else in the mechanical line; and you have to deal with that business sense and ability and acumen, and with a war chest.

Mr. THOMPSON. But your statement amounts to this, Mr. Eidlitz, that where there is good organization there are greater fears. From your explanation of that I would understand that that fear is simply that if there is a rupture it is more serious.

Mr. EIDLITZ. That it is a serious thing. That it is not gone into lightly.

Mr. THOMPSON. But in the relations from day to day, in the carrying out of their respective parts of production or industry, the greater organization holds a greater position, does it not?

Mr. EIDLITZ. Absolutely.

Mr. THOMPSON. I simply wanted to get that.

Mr. EIDLITZ. Yes. You see an awful lot about the relations of capital and labor and what they are going to do. That is my opinion of it, after having worked with them for that length of time, that it is a question of selfishness on both sides; many times the employer is just as much to blame, and sometimes more, than the workmen, and you have got absolutely to take an organization that takes them in hand. We do not do a thing to some of these employers; they are fined good and plenty.

Mr. THOMPSON. Do you enforce your rules?

Mr. EIDLITZ. Yes; absolutely.

Mr. THOMPSON. And you get the money?

Mr. EIDLITZ. We get the money.

Mr. THOMPSON. It is not proper, perhaps, to ask what becomes of that money?

Mr. EIDLITZ. The money goes into the war chest of the Building Trades Employers' Association.

Mr. THOMPSON. Where the action of an employer has resulted in injury to an employee, does any of that go to the employee?

Mr. EIDLITZ. No; we never give anything to the employee.

Mr. THOMPSON. We have had instances of that kind in the molders' trade.

Mr. EIDLITZ. There may be some instances of that in other trades, but that is not so in ours—that is, in the mason builders' trade.

Mr. THOMPSON. I understand the agreement practically expired as a matter of definite contract, but exists as a matter of common-law practice. That is true, is it not?

Mr. EIDLITZ. Yes.

Mr. THOMPSON. What was the form of the arbitration board under that agreement?

Mr. EIDLITZ. Under the arbitration agreement each one of the trades had to have a trade agreement—definite arrangement—but that exists between the employer and his workmen. Then, there was a trade arbitration board for each trade, where the minor troubles were brought up. But where the real trouble would be apt to arise in that industry, you see, would be where one trade would claim jurisdiction over something that another trade claimed—both bona fide union men and both having apparently the right to make that portion. That led to what we call the sympathetic strike, and there we were for many years subject, at a moment's notice, to having the plumbers pulled out on one job, or the steam fitters pulled out on another job, all because the steam fitters or the plumbers claimed that the work to be performed that was in their jurisdiction was being performed by the other people and, therefore, the trouble was on.

So the object was to do away with the sympathetic end of it. That is where this general board came into force.

Now, each trade was organized; each trade had its own arbitration board. In addition to that each trade sent two representatives, two employees, and two journeymen from each trade into the larger body, which was known as the general arbitration board which was composed of 120 men. Of course, with 120 men you could not do business, so there was an emergency committee created composed of 12 men, who sat on an average of about three times a week from 8 to 12 in the evening. They handled all the cases that came up. That was a joint committee composed of six journeymen and six employers. Whenever a case came up which involved anybody on the board, he had to get off of the board and he was replaced, so that nobody was trying his own case or the case of his own trade.

This emergency committee made the absolute ruling in the interim of the meetings of the board, which occurred once a month. If a ruling was felt to be very onerous on the loser, he had a right to appeal to the general body, and a vote was then taken in the general body as to whether or not they would order that motion or order reviewed, and if not, why that was the final order of the board and it had to be maintained and lived up to.

That went along for seven years. Under it any number of minor troubles were adjudicated and in addition about 90 contentious questions of sympathetic trade disputes.

Mr. THOMPSON. What ordinarily are called jurisdictional matters?

Mr. EIDLITZ. Jurisdictional matters—90 of them. They are right in this book.

In 1910 the steam fitters struck. They raised the wages. They were ordered back to work by the executive committee. They did not go. They were ordered back by the general body. They did not go. We gave them another week—so as not to make the fight—and brought them up again, and again they were ordered by the general body of 120—60 on each side—to go back to work, but they did not go. Then the arbitration board adjourned, because it was one of the articles in the document that the unions as a whole guaranteed the faithful performing of each organization. It might not apply to a single man, but when it came to the organization, the unions as a whole guaranteed the faithful performance in carrying out the edict of that board. That gave them three chances, but they did not do it; and, then, we had to go in and lick them and it took us five months to do it.

Mr. THOMPSON. In the meantime what became of this proposition?

Mr. EIDLITZ. That was abrogated, and the board was adjourned, and it has never come together again. There have been several attempts made to bring it together, but the trouble was that—during the interim, through the house complications—there are really one or two organizations there who are not in a position to maintain their position; in other words, you have one or two trades there in which the same situation obtains that was manifest in these garment trades—the point being this: Human nature is a gamble, and—until one makes the experience that the gamble is not worth it—he is bound to try it on, and there are a number of new men coming into the field all the time that are willing to take a wildcat chance instead of being conservative. That

this the reason these men are working along with the preferential shop—some of the men union and some of them not union.

I will tell you, I have never been in a shop of the garment industry and I do not know anything about such a shop; but I will tell you, from my knowledge of union conditions, that the only reason why an employer employs a union and nonunion man is that he wants to have the balance of power, so that if the situation is just right he would really be in a position to crowd down the union as well as the nonunion. The man who has a brain and is seeking to improve his condition is absolutely bound to go into the union. It means bettering his condition and raising his wage, and, therefore, if he has any sense at all, he goes into it. There are a few isolated individuals who have still got the idea that the individual is the sole master of the situation—that he has a right to sell his labor as he wishes, and so on. That is not so to-day. This is the day of the group.

Mr. THOMPSON. Then you do not agree with Mr. Briggs, the molder, in the statement he made, that he believed that the workingman could better his condition quicker and could do better individually than he could by joining an organization?

Mr. EIDLITZ. I know very well he could not, because it is not in human nature to permit him to do it. Any man who starts out in business, any young man with limited capital and full of ginger, thinks he is going to show the older concerns how to do it, and the way he does it is by trying to get the best of his neighbor. An organization is simply the defense against that condition, and all this talk about a preferential shop is bosh.

Mr. THOMPSON. You are not at all on the fence in that question?

Mr. EIDLITZ. I never have been—all my life.

Mr. THOMPSON. You have not talked with Mr. Brandeis about it, I take it?

Mr. EIDLITZ. No; I do not know the gentleman.

Mr. THOMPSON. I would like further to ask you about what machinery has been used by the two associations since the abrogation of this contract to adjust their grievances on matters between them.

Mr. EIDLITZ. I want to make quite an important point there, as long as you bring it up. The general arbitration board provided this. The main cause of friction between the employer and the union is the walking delegate or business agent. Now, if he is an honest business agent he is a great help to both sides. If he is a dishonest agent, and is looking to polish his halo or be a "hell of a fellow" to his craft, he is going to make trouble for you; that is all.

Now, he has the opportunity, being backed up. Pardon me, Mrs. Harriman.

Commissioner HARRIMAN. That is all right.

Mr. THOMPSON. Do you want to make any additions to that?

Mr. EIDLITZ. I forgot for the moment; you will pardon me, Mrs. Harriman?

Commissioner HARRIMAN. Certainly, Mr. Eidlitz.

Mr. EIDLITZ. When I get on that subject, you know, I feel pretty strongly on it.

Well, when this plan was started it was really the revolt of the employer against the nefarious practices of the business agent. It was stipulated that the members of the general board should be members who are at work at the craft—not business agents, not business officers. In other words, it was stipulated that they should be men who would represent their organization. Here is an organization with four or five thousand men, or with 1,200 men or with 600 men, or whatever it might be. They certainly ought to be able to find two men in that body who could adequately represent them on that board, without taking one of their business agents or an officer or some one of that sort. Of course, in some cases they did select a man who had been a business agent, and of course we could not take exception to that. That is what happened. When the board ceased operations, of course those who had been appointed to represent the unions on the board could no longer act, because the board no longer existed, and the only relation between the employers and the men, outside of the trade board, because, mark you, the trade board was in existence all this time—

Mr. THOMPSON. The individual trade boards?

Mr. EIDLITZ. The individual trade boards were all going just the same, except the steam fitters, and then they healed up and they started. But the general board did not start again, and the way the proposition is handled is that whenever there is a discussion which can not be handled with the trade board a committee from the building trades council appears before a committee of building trades employers, which is an executive committee, and we call the executive committee, and a decision is reached right there as to what

is to be done with the situation, whether we say, "We will not grant it. Do your worst." or "We will discuss it." or "We will do this," or "do that." But it is handled right in committee now. We have had half a dozen arbitrations since then. The whole attitude absolutely is to do the right thing and to be conciliatory up to the point where the demand is unreasonable, and the men have in all fairness no right to demand what they do, and then we sit back and fight.

Mr. THOMPSON. Have there been since the strike of 1910, which you speak of, many sympathetic or jurisdictional strikes?

Mr. EIDLITZ. Very few. I want to say that one of the things that I think ought to go very far to convince everybody that this plan has done a very useful work, one of the things that the building trades counsel did within a year after the dissolution of the board, was that they voted that this was the Bible [indicating book], so far as the trades were concerned, and that every trade in the counsel had to abide by these decisions, so that that by itself eliminated 90 per cent of all the points of dispute in the building industry.

Mr. THOMPSON. So far, in the matters which have come up since 1910, then, you have had no difficulty in adjusting them to the satisfaction of both sides and without any unnecessary delay and waste of effort?

Mr. EIDLITZ. Reasonably; reasonably. There have been one or two cases that have grown serious, but reasonably that has been done.

Mr. THOMPSON. Have you any opinion as to the advisability of reestablishing the old agreement now in New York?

Mr. EIDLITZ. I think that there probably will be some way of reestablishing it, whether it will be quite in this way or not I am not prepared at this time to say. I think it could have been reestablished if the trades had not made the demand that certain organizations who are not at peace with their employers had to come in. We refused to establish a plant in which the employers and employees were not at harmony and peace with themselves. You see the point? In other words, if the employees and employers of that particular trade are not at peace, it does not do us a bit of good to have a trade arbitration board, because it simply means a row, with sides taken one way or the other. You can not get away from it. We were perfectly ready here a couple of years ago to take all of those trades that had the trade agreement with their employers and start the board over again, and then take each one in as they got at peace with their employers.

Mr. THOMPSON. Then you contended it would be a good thing to get the different factions, even though there was a lack of peace prevailing, together under a general agreement and through the channel and form of the agreement to bring about peace in the different trades?

Mr. EIDLITZ. There has been a difference of opinion on that. I personally would be in favor of it.

Mr. THOMPSON. You would be?

Mr. EIDLITZ. Yes. There is a difference of opinion on that, but there is something to it. I want to say right here that of course the main bone of contention is the iron industry.

The house men were the grossest offenders, and they made it very difficult for us, and at the same time I personally have felt that if a boy is bad there is no use spanking him continuously. He has been bad and he has had his punishment, and he has demonstrated that he would go to all the lengths possible in the way of being a bad citizen, but it is supposed that he has seen the error of his way, and that is my view of it. But that is not shared by the iron trades.

Mr. THOMPSON. Do you think that if a trade agreement containing the machinery for conciliation and arbitration generally were entered into in the building trades it would be of advantage to the industry, or would you be opposed to it?

Mr. EIDLITZ. There is no question about that. We have done it all these years and will continue to do it in one form or another. If we do not do it by that plan, we will do it as it is now, and it is a question whether or not it is a good way to do it by star-chamber proceedings. Twenty men get together and say what is going to happen, and that is the end of it. They can get together and have a lot of discussion and say, "You arbitrate that," and they will do it. Sometimes it takes them a little while to do it—feeling their oats again, you know—

Mr. THOMPSON. Do you mean the builders?

Mr. EIDLITZ. Both. We have one case where we ordered an employers' association to do it, and they backed and filled, and it took three months to make them do it, and nobody was suffering very much in the meantime; but they are doing it now.

Mr. THOMPSON. But still that would leave, would it not, as a matter of fact, the decision with the respective parties as to whether or not they would arbitrate?

Mr. EIDLITZ. It is really not very different from the emergency committee before. The emergency committee was authorized to settle. It was composed of six on each side, taken out of the general number.

Mr. THOMPSON. But this committee consists generally of the general employers only?

Mr. EIDLITZ. No; it is composed of men from both sides.

Mr. THOMPSON. I misapprehended that fact.

Mr. EIDLITZ. No; it is from both sides.

Mr. THOMPSON. I thought that a member of the building-trades council came over to this committee of 20 employers and said, "Here is the trouble. Now we would like you to meet about it;" and then the 20 employers met behind closed doors.

Mr. EIDLITZ. No; the whole thing is thrashed out right there, and the whole tendency and drift of the relation has been so completely stipulated and indicated by the last 10 years' work that everybody understands it; and if any sort of a fair case is made there is no doubt about the decision.

Mr. THOMPSON. Then we might say that there is now a common law existing in the custom of the trade?

Mr. EIDLITZ. Yes; that is it exactly.

Mr. THOMPSON. Which has been founded on the agreement, and that under this custom you have got substantially all that could be gotten by an agreement, and it is really in effect a tacit agreement?

Mr. EIDLITZ. It is a tacit agreement; but, you see, it has all been built up. The only questions that come up are questions of jurisdictional disputes.

While I have the privilege of being before you I should like to give vent to one thought right in connection with that, and that is this: I am satisfied the way the whole industrial relation is trending now is that the way to have peace is to have your trade relations, the family legislating for itself, and to have, if you like, a larger body, as in our case, or as in many other industries, to which matters are referred; but beyond that, if it comes to a case of lockout or strike, before they come to that it should go to a judicial body known as the industrial court of that State, of that city, and there should be an appointment of one industrial court of three or five or whatever number may develop to be necessary, if possible, by the Supreme Court of the United States.

Commissioner DELANO. Appointed at the time, or a standing court?

Mr. EIDLITZ. A standing court, I think, should be in every State, and particularly in some of the big cities. We have a night court for family relations. Now, I think it would be a pretty good thing to have a night court about once or twice a month for industrial relations.

Mr. THOMPSON. Family relations?

Mr. EIDLITZ. Yes; certainly. We have that right in New York. Bring up all these little scrap cases in the family.

Mr. THOMPSON. Not living in New York, I was not acquainted with what that meant.

Commissioner DELANO. What would be the idea, then, as to the establishment of, say, some form of special council for the consideration of industrial disputes that could be appealed to by the parties, either or both of the parties, in such cases of last resort as you have named; perhaps a body without power to enforce, but power at least to investigate?

Mr. EIDLITZ. That is the building-trades department of the American Federation of Labor, and I do not believe in it.

Commissioner DELANO. How would it be if the Federal Government did it?

Mr. EIDLITZ. It would be very fine if they did it.

Commissioner DELANO. Like the Industrial Council of England?

Mr. EIDLITZ. Mind you, when I say I do not believe in this building trades department of the American Federation of Labor, I do not want to be misunderstood. I absolutely believe in their end of it, in the national association to handle troubles in their own unions as between unions; but for the building trades department to set itself up as judges of what is happening in one locality or another, when as a matter of fact they have great difficulty in con-

trolling their own organizations in different localities, and then for them to come and say what opinion they have about the employers in that industry, is just arrogating to themselves a power that they can not maintain.

I have very good friends among the American Federation of Labor, and I know them very well, and they know where I stand on it. They are doing a great work, and I am with them, and all that sort of thing, but you can not have any discussion in any court of last resort, when the judges there are biased, as they are bound to be.

Commissioner HARRIMAN (acting chairman). Mr. Lennon, do you want to ask any questions?

Commissioner LENNON. I want to ask you, Mr. Eidlitz, in view of the fact that this commission is going to meet in New York on the 4th of May, whether you would be willing to submit to us a brief at that time, indicating how you believe the jurisdictional problems can be eliminated from the building trades?

Mr. EIDLITZ. I wish I could, Mr. Lennon.

Commissioner LENNON. You have been up against it, and you must have given some study to the matter.

Mr. EIDLITZ. I will say this, that I think you are starting partially in the right direction now. I think that the uniting of the steamfitter and the plumber now is a good thing.

Commissioner LENNON. Would you be willing to undertake to do that?

Mr. EIDLITZ. The only point about it is that you see you may go pretty far in that. You propose to build up the house men by giving them the metal lather and perhaps the pipe coverer. Now, we are not for it.

Commissioner HARRIMAN. Why?

Mr. EIDLITZ. Because the metal lather has a very strong organization of his own there, and it brings up all sorts of pipes, you know, and you are getting pretty close to the quick on many of those propositions.

Commissioner LENNON. Where you see that the matter is going to work out itself for you, the building contractor, your are for it, and where you see it is going to make you more trouble you do not care to be pushed just at the present time.

Mr. EIDLITZ. Well, I will put it that way. Then there is another point that you do not want to forget, and that is that the stronger combination is not with you at all, and that is the bricklayers. We have got to reckon with him.

Mr. THOMPSON. Does he have any jurisdictional fights?

Mr. EIDLITZ. Well, some. [Laughter.] I was in hopes of meeting some of my friends here to-day.

Mr. THOMPSON. Does he fight with the plumber?

Mr. EIDLITZ. Oh, no. He has got an arrangement now with the plasterer. There is one branch of the bricklaying industry which is the stonemasons. I think we are getting a little too intimate, now, on this thing. I do not think it belongs to you.

Commissioner LENNON. We will not take it up now.

Mr. EIDLITZ. But it is a fact. The only point I want to make is this. I absolutely believe in unionism. I absolutely believe in collective bargaining. I absolutely believe in the relation between the employer and the employee in the trade board and in any other method of arbitration that you can devise for taking care of jurisdictional troubles, I do not care where they come from. But I do not think that I want to say at this time that I want to do anything that is going to inordinately bolster up the other side of the fence, particularly when they are not in a position to maintain the stand that they are standing on, and I know it, and I know what I am talking about.

Mr. THOMPSON. I will say that our idea is to go into this proposition more fully in the other cities in the country, and while I am not authorized to speak for the commission, they will simply take the question as it comes before them and consider it.

Commissioner LENNON. Most of the agreements as between you and the bricklayers, for instance, are verbal agreements. They are understandings reached by men; they are not written agreements?

Mr. EIDLITZ. Absolutely, every agreement is a written agreement. I should say so; and there have been some things that have been in that agreement, and that have been in for 10 years, and then we finally came to the test after 10 years, in regard to the necessity for an interpretation of them, and we had to get a lawyer in there to interpret them, and he found against us.

Commissioner LENNON. Do any of those agreements appear in your book which you have here?

Mr. EIDLITZ. No, sir.

Commissioner LENNON. They do not.

Mr. EIDLITZ. I want to say right now to you gentlemen—I think after what I have said I owe that to you—of course, in New York the relation between the employer and his employee is very close, and for that reason you will find that it is not so easy to upset conditions there.

Mr. THOMPSON. It is far more easy in other cities than it is in that city? What do you mean by that?

Mr. EIDLITZ. I mean to say this, that I think there are a number of trades there that if their national organization were to tell them, "It is for the best interests of our organization as a whole that you shall break your contract with your employer," they would say, "We will be a local," and "Good-by." They would say, "We will take our chance with our employers." That is what I mean.

Mr. THOMPSON. I was referring to the matter of local conditions.

Mr. EIDLITZ. I mean the relations between employer and employee in New York. They have scrapped together, hard, and they have a good deal of respect for each other, and the employees know when the employer tells them he will do thus and so he will come pretty near doing it. If they can get the employer to enlist with them, they will say good-by to the central body.

Mr. THOMPSON. Then you have not the idea that Mr. Cohen had, that you should look to the international union rather than to local unions?

Mr. EIDLITZ. You threw out a point there which I knew all about. You threw out a point there which meant that on these jurisdictional questions the American Federation of Labor, or the building-trades department of the American Federation of Labor, should come in and adjust those disputes.

Mr. THOMPSON. Oh, no; I had not that thought.

Mr. EIDLITZ. I thought that was what you were driving at. I beg your pardon, then.

Mr. THOMPSON. No; I was asking you what you thought about a federal body created by the United States Government.

Mr. EIDLITZ. I told you I thought that would be a fine thing.

Mr. THOMPSON. But, although I am acquainted with several of the officers of the American Federation of Labor, I did not know that they had such a thing as a building-trades council; or, if I had known it, it had absolutely passed out of my mind.

Mr. EIDLITZ. They are doing a great work.

Mr. THOMPSON. I know of the international unions. I hear of them in Chicago a great deal; but the American Federation of Labor proposition was new to me.

Mr. EIDLITZ. I absolutely agree with you, in that I think it would be a wonderful thing if we could have all of these preliminary difficulties considered in that way; and then if there was a somewhat higher tribunal, an industrial court, very carefully selected and appointed, they could go into that before the strike or lockout began; and my idea is that the United States should form them in the various States.

Mr. THOMPSON. Do you think the unions would agree with you on that?

Mr. EIDLITZ. I do not know. I do not see why they would not.

Commissioner LENNON. Would not such a trade court have to be in different branches? Would not there have to be a branch to handle the building trades, for instance, and nothing else?

Mr. EIDLITZ. I do not think so. I think if we had good legal minds on that court, that would be all that would be necessary; good intelligent minds; that is all that would be necessary. The trouble is that we often see things the wrong way, and we are very honest in our viewpoint of the thing, and we get at loggerheads, whereas it might be different if some dispassionate outsider should say, "You are wrong." On two occasions we have felt that we were absolutely right, and we would have fought about it, but our document says an umpire should come in, and the umpire has said, "You are wrong," and we laid down.

Commissioner LENNON. I have been dealing with jurisdictional disputes for about 30 years.

Mr. EIDLITZ. What is your trade?

Commissioner LENNON. I am a tailor by trade. I have dealt with all of them; and every one of these trades I have had to do with. I think on the disputes between the steamfitters and the plumbers I have had to change my mind, as I got more light, three or four different times within those 30 years.

I do not know that I would be competent, even now, to deal with all the phases of that question if I should start again, for instance.

Mr. EIDLITZ. Yes, sir.

Commissioner LENNON. And therefore I asked the question whether you thought that in the establishment of such a national board there would not have to be subdivisions; for instance, one for the building trades and perhaps another for the miscellaneous trades, and so one.

Mr. EIDLITZ. I have not given that sufficient thought to have an opinion on it. I have simply come to this conclusion, after having been with it now for this length of time, that the way matters are going now it should not be left any more to the family because of the results that happen; the outcome of the happenings is so serious that it should not be allowed any more to happen.

Commissioner DELANO. I did not understand what you said. It should not be left to what—the family?

Mr. EIDLITZ. Yes. You see, for instance, the most important indication of that is the condition of the railroads to-day. That is the worst type of it. In other words, if the railroads in self-defense should take the old stand and sit down and say, "Now, we are going to make the fight. We refuse to go any further. There is no reason why we should allow the Government to put us into bankruptcy. We are going to stop"—that would mean this. That would mean such an unfortunate situation for all the inhabitants of those various States which are supplied by the railroads that it would be a crime. It would not be allowed for a minute. It would be a case of anarchy.

Follow that down from that conclusion. Take it in the building industry. That means a great financial loss. If a man is putting up a building that costs a million or a million and a half, if he does not get it up in time he suffers a great financial loss. Still, it is not the same thing as a forwarder or a carrier who is put in a situation through labor disputes. Now, I say formerly they straightened it out and conciliated and then put the price on the public and went on again. But, I say, if they are going to have Government interference on one side, it should interfere all the way through. Let the family have their scraps and their agreements, but when they come to the point where they are not going to work any more and all the machinery that is in that particular industry has been exhausted to take care of it, and it becomes a case of a shut-down, I think it should go to the industrial court to say which is right and which is wrong and what ought to be done about it.

Mr. THOMPSON. Then your idea is to make that a sort of a compulsory court?

Mr. EIDLITZ. Yes; absolutely. Stop the economic waste. We have had enough of it.

Mr. THOMPSON. Have you followed the history of such courts carefully in Australia and New Zealand? They do not seem to have succeeded there.

Mr. EIDLITZ. I think there has been a good deal said on the floor below about education and about the thing being an educational matter, and it is, and there is no doubt about it. I think you will find where people have been making agreements and making contracts, if they agree that in case they can not get together they will submit it to industrial courts, then the compulsory part of it is not so serious, and if you have the court in existence you will find plenty of work for it to do.

Mr. THOMPSON. Just as it exists in the railroad machinery to-day, the board of mediation and conciliation being situated right here in this building?

Mr. EIDLITZ. Yes; after a fashion.

Commissioner BALLARD. The bricklayers' organization is a part of the international organization—the American Federation of Labor?

Mr. EIDLITZ. Yes; they are an international, but they do not belong to the American Federation of Labor.

Commissioner BALLARD. There are two separate things, then, the international and the American Federation of Labor?

Mr. EIDLITZ. Yes.

Commissioner BALLARD. I imagined they were the same.

Mr. EIDLITZ. No, sir; the bricklayers are an industry which is not affiliated with the American Federation of Labor; but most of the other crafts are.

Commissioner BALLARD. Most of the other 29 unions that work for you are?

Mr. EIDLITZ. Yes; most of them.

Commissioner BALLARD. What proportion of these 29 are affiliated with the American Federation of Labor.

Mr. EIDLITZ. Probably 95 per cent of them.

Commissioner BALLARD. There are only two or three that are not?

Mr. EIDLITZ. Yes. The unfortunate part of it is that that 5 per cent can do pretty nearly as much damage as the other 95 per cent.

Commissioner BALLARD. Will the unions in New York work for any contractors who are not members of that association?

Mr. EIDLITZ. Certainly; but the contractor has got to pay the scale and live up to all conditions. In other words, we meet and make the trade conditions for the city of New York in the various departments, and everybody else is supposed to live up to them, as we have to, and they watch us a good deal closer than they do an outsider.

Commissioner BALLARD. Can any man who works in any of the different crafts work for anybody in the union?

Mr. EIDLITZ. I think there are some exceptions. There have been some unions which have taken a position that is very reprehensible; they have kept their ranks closed and have charged enormous fees, and there were only certain times of the year when they would take accessions to their ranks.

Commissioner BALLARD. Is it as easy for a man to rise from the position of a workman to that of an employer as it was 20, 30, or 40 years ago? Do you think that the union system has a tendency to level and hold men down and keep them back from becoming contractors?

Mr. EIDLITZ. I do not think so. I do not think it is quite as easy now. The field of opportunity is not as great now in any part of life, and that holds in the building industry as well as in any other.

Commissioner BALLARD. Does your association with the unions in the building trades countenance sympathetic strikes? For instance, if there is a strike in any other town among the teamsters or any other class of workmen that is not affiliated, would they call a strike on a building that might be under construction or undergoing repairs?

Mr. EIDLITZ. That was one of the things that was tried in former years. That was eliminated by virtue of this plan. I do not think the organizations consider that a quite legitimate kind of warfare any more. I think that is rarely done any more. They confine the troubles of a given trade to its own city.

Commissioner BALLARD. Then they would not have a sympathetic strike because of some other town having a strike?

Mr. EIDLITZ. They could not do it, providing the agreement of the town you are talking about prevented them from doing it. In other words, they would not bring trouble in from New Haven if the New York agreement stated that they were not to withdraw the men from the shop; that is, unless it was something that was a specific violation of the agreement. That is a good question, though. There is some of that done.

Commissioner BALLARD. The New York contractors take jobs in other towns?

Mr. EIDLITZ. Yes.

Commissioner BALLARD. Does your firm do that?

Mr. EIDLITZ. Yes.

Commissioner BALLARD. If you take a job in some other city where there are these labor unions, the members of which do what goes into that particular building, and if they are not all represented in that particular town, how do you handle it—let the nonunion men in other trades go on and fill up the gap, or is it necessarily done by union men?

Mr. EIDLITZ. I employ union men, absolutely, wherever I go.

Commissioner BALLARD. If any part of the work in a building in any other city, which you are building, is done by nonunion men, then the whole thing would stop?

Mr. EIDLITZ. Oh, no; they know where the New York contractor stands, and they would simply tell him about it, and he would correct it. This business of a flash in the pan is pretty well eradicated.

Commissioner BALLARD. That is, the tendency of the New York contractor who contracts to work union men only would not be to utilize in other towns, in building contracts, nonunion men, because when you go to those other towns you insist upon having union men only?

Mr. EIDLITZ. Yes.

Commissioner BALLARD. Will union men work on all kinds of products, whether they have been made by union or nonunion factories?

Mr. EIDLITZ. Some trades have taken that up, but in most trades it does not enter. In all clay and brick products and all pipe products they are all union.

Commissioner BALLARD. Will the steam fitter fit pipes from a nonunion factory?

Mr. EIDLITZ. Yes; it is none of their business.

Commissioner BALLARD. But some of the trades do discriminate?

Mr. EIDLITZ. Yes; the wood trade.

Commissioner BALLARD. It does?

Mr. EIDLITZ. Yes. That is about the only one.

Commissioner BALLARD. Supposing you are building a building in some other town and the architect should specify some other character of material or work, like frames of doors, which have been made by a nonunion shop; then, they would not put them up?

Mr. EIDLITZ. They might, but it would depend upon where it was. In the city of New York they probably would not, and if the architect specified it that way, the contractor would not order it. He would know what he had to do.

Commissioner BALLARD. Do men do as much work now as formerly? For instance, do bricklayers and others do as much work as they used to do? I have heard it stated that they do not.

Mr. EIDLITZ. It varies in certain crafts. You take the average bricklayer to-day, and I think he is doing as much work per hour as he ever did in his life on the kind of work we do. You must not forget that the entire method of construction has changed, and it is impossible to take a skeleton building, where a man is putting up a 12 by 16 inch wall envelope, and in passing from one to another, the bricklayer has to lie down and do his work, and he can not do as much as he used to do.

Commissioner BALLARD. You do not find, then, that the tendency is for men to work slower and for all the men to stay with the slowest man instead of speeding up for the fastest?

Mr. EIDLITZ. No; that is a talking point, but one of the reasons why some of that happens is not so much from the desire, as possibly on general principles, that a man does not want to do more work than he has to, and due to the fact that many of the men masquerading as employers ought to be in the ranks. They do not know how to do the business.

Commissioner BALLARD. As I gather, in the building trades now the working day is nearly always eight hours?

Mr. EIDLITZ. Yes.

Commissioner BALLARD. Do you find that the men do about as much work in 8 hours under continuous work as they used to do in 9 and 10 hours?

Mr. EIDLITZ. No.

Commissioner BALLARD. You think they do less work?

Mr. EIDLITZ. I will say they do as much work per hour.

Commissioner BALLARD. But not as much per day?

Mr. EIDLITZ. No. Some of them say they do, but I know they do not. How can they?

Commissioner BALLARD. You ask me, "How can they?" I think it is probably a fact that in fatiguing and laborious trades the men do about as much work in 8 hours as they can in 12. You have not found that so?

Mr. EIDLITZ. I would not like to say as to that. I can imagine a condition where what you say is true.

Commissioner BALLARD. In the building trades you do not think that is so?

Mr. EIDLITZ. I should not think so. I think this, that the character of the work determines that so much that I do not think that I would like to answer that.

Commissioner BALLARD. You were speaking a while ago of a contractor putting up a building where the amount involved would be several million dollars, but the principle would be the same in any sized building, and some dispute might arise and the building be partly completed and remain for some considerable time at the expense of the owner?

Mr. EIDLITZ. Yes.

Commissioner BALLARD. There has been no way found of settling jurisdictional disputes?

Mr. EIDLITZ. Yes; we have settled 90 of them right here.

Commissioner BALLARD. Yes; but how many have there been?

Mr. EIDLITZ. It is not that there are so many different kinds, but there are so many repetitions of the same thing. You might have 20 strikes going on on the same basis, in different places. Mr. Plumber says that he wants to run this piece of pipe, and the steam fitter says that he has got to run the same pipe. Mr. Steam fitter will be put off the job, and Mr. Plumber will run the pipe. Some distance away, where they are not so anxious about the plumber,

the plumber will be put off the job and the steam fitter will do the work. The point is, who does it. We do not do it.

Commissioner BALLARD. That has not been settled?

Mr. EIDLITZ. Yes; a lot of it has been settled.

Commissioner BALLARD. In New York does that come up to this board that would order this union to go to work?

Mr. EIDLITZ. Right on that I should like to tell you why I made the statement that I did before. Before this proposition was inaugurated at all and when the board of building trades—that is, the representatives of the unions—were in full force in New York, a jurisdictional case of this kind came up, and the general contractor or the subcontractor said, "We do not care who does it. The board of building grades settles who is to do it." They did it. They rendered a verdict. What happened? The organization that had the ruling made against them immediately resigned from the building-trades council and went out as a free lance, you see; and that is the same thing that will happen if it is worked from higher up, that is all.

Commissioner BALLARD. I have no more questions to ask.

Mr. EIDLITZ. You can not get an adjustment on a jurisdictional trade dispute, or any one of these disputes, unless the employer and the employee are parties to it, and unless they agree; if they can not agree who is to settle it and that it shall be final, if they both feel that it is not final, and it is not lived up to, it means a fight, and it is going to be serious for both sides.

Commissioner BALLARD. Is that agreement in force in New York City?

Mr. EIDLITZ. Yes.

Commissioner DELANO. What proportion of the contractors in New York are in your organization?

Mr. EIDLITZ. You mean of all the contractors?

Commissioner DELANO. Yes; of the building contractors.

Mr. EIDLITZ. I do not know what proportion.

Commissioner DELANO. Just roughly?

Mr. EIDLITZ. But I should say this, that in some of the trades I suppose there are 95 per cent of the business. In other trades, notably the plumbing trade, due partly to this situation, we do not control more than 60 per cent.

Commissioner DELANO. I want to get some idea of the numbers, so as to know how difficult it is. Is it a large number? Does it run up into the thousands?

Mr. EIDLITZ. No; I say there are about a thousand in the building trades.

Commissioner DELANO. I understood you to say that in your 32 years of experience you had only two or three cases.

Mr. EIDLITZ. In the disagreements between the bricklaying trade. That is only one branch.

Commissioner DELANO. I was rather afraid I had misunderstood that.

Mr. EIDLITZ. Yes.

Commissioner DELANO. In those 32 years how many serious interruptions or strikes have there been; many?

Mr. EIDLITZ. An infinite number, until we reorganized the whole situation.

Commissioner DELANO. That dates from what time?

Mr. EIDLITZ. That dates from 1903.

Commissioner DELANO. But in 1910 you had some trouble, did you not?

Mr. EIDLITZ. Yes; and we will always continue to have trouble as long as we live.

Commissioner DELANO. But I mean you had a long strike in 1910, did you not?

Mr. EIDLITZ. In one industry.

Commissioner DELANO. Of course, we are trying to discover the way of getting industrial peace, and in some industries, notably anything connected with public service, there can not be an interruption of an hour, even. The thing must go on.

Mr. EIDLITZ. Certainly.

Commissioner DELANO. You gentlemen are willing to face a situation where you have an interruption of a day or a week, or even longer, but in some cases nothing of that kind can be tolerated?

Mr. EIDLITZ. Exactly.

Commissioner DELANO. Then your idea of the solution in that case is to have some court that shall be selected in advance and not wait until the trouble comes to select the court?

Mr. EIDLITZ. Yes.

Commissioner DELANO. I wanted to ask you what you referred to, about the umpire. Have you found the best results when the umpire was selected in advance or from waiting until the parties failed to agree and then selecting him?

Mr. EIDLITZ. I think that until the case is ordered to a real arbitration, the factor of there being no umpire does not hurt the case at all. I think when you come to the umpire, then is the time to say, "Now, we have got to go to an umpire," and then start and elect him.

Commissioner DELANO. What provision do you have—

Mr. EIDLITZ. I beg your pardon; perhaps I have given you the wrong impression. Where the case has been absolutely ordered to go to an arbitration, then of course before you go to an arbitration at all the arbitrators select the umpire.

Commissioner DELANO. But suppose you can not agree? Suppose there is a deadlock on the umpire? I have known such cases.

Mr. EIDLITZ. We select three or four, naming them as first, second, third, and fourth choice. We put those names in a hat and whichever one comes out, he is the man, and we go and see him. If he will not serve, then we go to the second one, and if he will not serve, then we go to the third one, and so on until we get a man.

Commissioner DELANO. Do you mean each party goes?

Mr. EIDLITZ. Yes; each one.

Commissioner DELANO. But I have known cases where 10 or 15 men selected by one side were rejected by the other.

Mr. EIDLITZ. Yes.

Commissioner DELANO. Do you not ever have cases like that?

Mr. EIDLITZ. We have had quite a number, of course, submitted; but I am talking about when we get to the point where they say, "On a pinch, we will take him." I do not mean to say that either side has not proposed half a dozen names which the other side would not agree to.

Commissioner DELANO. Do you ever have such a thing as running out of umpires?

Mr. EIDLITZ. Oh, yes; it is a very serious proposition, and it is a very difficult one.

Commissioner DELANO. What is the solution of that?

Mr. EIDLITZ. We have not got quite to that point.

Commissioner DELANO. The reason I ask is because you have been in this game a long while and have studied it.

Mr. EIDLITZ. Yes.

Commissioner DELANO. I should like the benefit of your suggestions.

Mr. EIDLITZ. So far the main trouble is, of course, to find a man with enough civic interest to give up his time and do it. Whether New York is specially favored in that direction or not, I do not know, but so far we have found men who are willing to do it.

Commissioner DELANO. You have got a good many to draw from there?

Mr. EIDLITZ. Yes; we have a good many to draw from. For instance, in this book you will find Charles Stewart Smith and Mayor Gaynor.

Commissioner DELANO. Do you find that a man who has rendered a decision favorable to one side is satisfactory a second time?

Mr. EIDLITZ. Oh, he never gets a chance again. Whenever a man has made his decision, that is final.

Commissioner DELANO. In regard to this vote of these 120 men you spoke of, where you said that was the third appeal, you said your joint committee of 120 men turned down the men who were on strike and ordered them back to work?

Mr. EIDLITZ. Yes.

Commissioner DELANO. In a case of that kind, was that a close vote?

Mr. EIDLITZ. There had to be a majority of each side present and voting; a majority—

Commissioner DELANO. Of each group?

Mr. EIDLITZ. Yes; of each group of 60.

Commissioner DELANO. That is what I wanted to know. What has been the effect, in the 32 years of your experience, in the matter of wages? How much have wages gone up in that time?

Mr. EIDLITZ. In our craft they have gone up from 42 cents to 70 cents since 1884.

Commissioner DELANO. That is more than wages in general have gone up, is it?

Mr. EIDLITZ. Perhaps a little more.

Commissioner DELANO. A little more?

Mr. EIDLITZ. You do not want to forget that the building trade is a hazardous industry, and that it is an industry that does not work all the year around. It is seasonal.

Commissioner DELANO. I presume that the cost of building has been advanced about in proportion, or fully in proportion, to the wages of the men employed in the trades, has it not? You have been able to charge that to the——

Mr. EIDLITZ. In most cases that is true, although——

Commissioner DELANO. You have increased your efficiency, have you?

Mr. EIDLITZ. We have overcome some of it in that way; and, furthermore, materials perhaps that formerly cost more money are now less, in some instances. Of course that does not apply to lumber. That is where there has been a premium in changing from lumber to steel. There is no doubt that in that respect there has been a decrease in the cost of material, and then an increase in wages all the way down the line. The increase in wages is not reflected in the cost of building to-day over what it was 30 years ago.

Commissioner DELANO. That is all.

Commissioner HARRIMAN. That is all. Thank you, Mr. Eidlitz.

TESTIMONY OF MR. W. J. SPENCER.

Mr. THOMPSON. Where are you located, Mr. Spencer?

Mr. SPENCER. At Washington.

Mr. THOMPSON. Have you had any experience with the New York arbitration plan of 1903?

Mr. SPENCER. None, except from a distance. The matter in New York is a purely local concern and did not affect the internationals or the organization that I at present represent.

Mr. THOMPSON. Then you would not be the best man to speak on behalf of the plumbers in regard to that New York arbitration plan?

Mr. SPENCER. No, sir.

Mr. THOMPSON. Therefore I will pass that by, so far as you are concerned.

Has there been any system of settlement of jurisdictional disputes involved in Washington here that abrogates a previous one?

Mr. SPENCER. First let me explain my position. I represent the building-trades department of the American Federation of Labor, and it in its scope takes in the entire country; that is, we have 20 affiliated organizations. All affiliated unions are international, and only internationals may affiliate. After we have secured the affiliation of the eligible organizations, then we establish local councils in the several cities throughout the country for the purpose of carrying out the law and the decisions of the department in general, making the claim complete, as it were.

Now, since that is the case, we have had no special duties to perform in the city of Washington, nor have we arranged or had any cognizance of local agreements or jurisdictional disputes, or of means of settling them, but on one occasion we did propose a general plan, not local, because we look upon jurisdictional disputes as general and not local at all. We proposed to the employers' association, of which Mr. Eidlitz, the previous witness, is a very active member, a plan of settlement that I still believe to be very meritorious. We proposed that a committee of seven, for want of a better illustration, but it may be more or less, representing the employers and a like committee representing the international union be selected, and that they should sit down and mull over the different troubles that arise in the building industry and try to reach conclusions in those disputes that each of them know are bound to arise and endeavor to find a solution of these disputes, not as they affected us in Chicago but all over the country, and simultaneously.

We proposed that plan. It has never been turned down, but it has never been accepted by the employers. I imagine it is largely because the employers of the standing of Mr. Eidlitz are somewhat reluctant to handle disputes affecting the building trades, or any kind of dispute, as a matter of fact. Their time is taken up with their own affairs—building affairs—and that to the exclusion of the building disputes. It is pretty hard to get Mr. Eidlitz or his friends interested in a matter of this kind, although Mr. Eidlitz goes further than any of the rest of them.

Mr. THOMPSON. I had intended to ask Mr. Alpine the result of his union dealing with the Federal association, or this American Federation of Labor body that you speak of.

Mr. SPENCER. Yes, sir.

Mr. THOMPSON. Which Mr. Eidlitz spoke of.

Mr. SPENCER. Yes, sir.

Mr. THOMPSON. Would you feel qualified to speak for him in that regard?

Mr. SPENCER. Let me understand you correctly. The relationship of the United States Building Trades Association with the building-trades department of the American Federation of Labor, do you mean?

Mr. THOMPSON. No; I do not mean that. What experience, if any, has the plumbers' union had with the building-trades department of the American Federation of Labor?

Mr. SPENCER. They have had many cases up there for adjustment or decision.

Mr. THOMPSON. Yes.

Mr. SPENCER. They have had one dispute being carried on—a dispute between the plumbers and the steam fitters—that has been before the building-trades department of the American Federation of Labor and every other body, whether supreme or minor. In the case where it has been called before them the plumbers' association got the decision over the steam fitters. They were of the opinion that the steam fitting was a subdivision of one general trade or craft, and that as a subdivision it should ally itself with the other subdivisions.

Mr. THOMPSON. Have the steam fitters accepted that?

Mr. SPENCER. Almost generally; yes. There are so very few cities now remaining out of the fold that I do not remember them. I do not know who they are.

Mr. THOMPSON. In your work in connection with the building trades department of the American Federation of Labor you do not come in contact directly with the question of collective bargaining, do you?

Mr. SPENCER. The plan of collective bargaining? There is no such thing in the building industry as individual bargaining. There is no such thing as an individual agreement there. They make agreements with their respective contractors all along the line.

Mr. THOMPSON. This building trades department of the American Federation of Labor is a body of men named beforehand?

Mr. SPENCER. Oh, no; it is an organization of international unions that operate in the building industry alone, that have come together and formed a delegate body, constituted by delegates from each international organization, and each delegate body then selects its officers and officials and executive council.

Mr. THOMPSON. In a dispute, such as you have named, between the plumbers and the steam fitters, to whom does it go? Does it go before your body, and how is it decided?

Mr. SPENCER. It is usually reported to the building trades convention of the department. The constitution of the building trades department requires that when a dispute occurs they shall endeavor to adjust it immediately, and if they fail, it is then reported to the convention and it renders a decision.

Mr. THOMPSON. What convention?

Mr. SPENCER. The next succeeding convention of the building trades department.

Mr. THOMPSON. Of what does that consist?

Mr. SPENCER. It consists of a delegate body of approximately 65 members.

Mr. THOMPSON. Did they take up, for instance, this dispute between the plumbers and the steam fitters, in that body of 65 people, and vote upon it, or did they delegate it a smaller body?

Mr. SPENCER. A conference was first held, and the result of that conference was reported to the convention, and the conferees had failed to reach a decision. It was reported to the convention and the convention thereupon decided which of the parties was right.

Mr. THOMPSON. The convention of 65 delegates decided that?

Mr. SPENCER. Yes.

Mr. THOMPSON. In other words, it was not taken up by a smaller body?

Mr. SPENCER. Of course that largely depends on circumstances. If there is a failure to understand any of the technical features of the dispute, it then

goes to the council, but finally it is decided by the convention, by the representatives of all the organizations.

Mr. THOMPSON. There is no decision made by any subordinate body to which you can refer any points of discussion?

Mr. SPENCER. No; that is impossible.

Mr. THOMPSON. Then the building trades department of the American Federation of Labor is simply some officials that are established there for the purpose of keeping track of things, and when disputes arise referring the matter to a conference, and then if the matter is not adjusted shortly to the convention?

Mr. SPENCER. The officials of the body are charged with duties of endeavoring to adjust disputes when they arise. When a dispute is reported it is the duty of the officers to try and reach an adjustment, a settlement of it, before it reaches the strike period. If the thing will permit of its standing over until it can be reported to the executive council or the next highest body in authority it is done so; and if not, it goes over to the convention.

Mr. THOMPSON. What is the success of the building trades department?

Mr. SPENCER. What has been its success?

Mr. THOMPSON. Yes; in handling these disputes.

Mr. SPENCER. It has had varying success. In some instances it has been markedly successful, in other respects not so successful. The cause for its nonsuccess is largely due to the suspicion of the employers as to the aims and purposes of the department itself. As I mentioned a moment ago, we proposed a perfectly plain and certainly well-balanced scheme to the employers' association, but they were reluctant to handle it, in fear that there was a "nigger in the woodpile," so to speak. That is the great danger in the building industry. We find that a proposition proposed by the employers is viewed with a certain amount of suspicion by the employees, and vice versa. The parties are being brought to a thorough understanding of each other's views. Hence it was the suggestion of the employers' counsel to have the two bodies come together by a subcommittee and have it presided over, if necessary, by an appointee of the Government Labor Department, or the President, or anybody else, so as to assure impartiality and honesty.

Mr. THOMPSON. In your opinion, in matters of that kind, is it advisable to have a third party to act, if need be, as an umpire, with deciding power on these matters in case the parties do not get together on a basis of conciliation?

Mr. SPENCER. Personally I favor that kind of a plan.

Mr. THOMPSON. Are you acquainted, Mr. Spencer, with the contracts which the plumbers' union has with building companies, if there are any?

Mr. SPENCER. No; the contracts between the plumbers and the other affiliated organizations are made by local unions direct with the local contractors. There are very few of them that are negotiated by the international organization. In case of the plumbers, for instance, they may make an agreement with a concern that is nation-wide in its character, such as a general fire extinguisher company or a concern of that character. In other trades they make direct agreements, too, with certain concerns; but for the most part they are made between the local organizations and the local contractors.

Mr. THOMPSON. Take the case of a national fire extinguisher company, what would be the language of the contract between the plumbers and that company?

Mr. SPENCER. I would rather not testify to that, because I am not acquainted with the technical relations between the two concerns. Mr. Alpine would be.

Mr. THOMPSON. There are some other questions of that character that I do not believe I will ask you, then. That is all I wish to ask this witness.

Commissioner HARRIMAN. Have you any questions, Mr. Delano?

Commissioner DELANO. I did not understand just what your position was.

Mr. SPENCER. I am secretary-treasurer of the building trades department of the American Federation of Labor.

Commissioner DELANO. And that is a building trades department of how many? How many men have you in it, seven or eight?

Mr. SPENCER. The building trades department is a group of the organizations members of the American Federation of Labor.

Commissioner DELANO. Twenty-five or thirty men?

Mr. SPENCER. No; it is composed of a group of 20 members—19 members at present. That is, the trades are represented in the department by delegates selected under the constitution by the international unions. It is really a delegate body.

Commissioner DELANO. That is what you referred to when you spoke of a council? When they get together you call them a council?

Mr. SPENCER. No, sir; the council is the local organization established by the department in any city. For instance, we established one in Washington and one in Chicago and one in New York, and so on.

Commissioner DELANO. Then the council takes charge of local things?

Mr. SPENCER. Yes.

Commissioner DELANO. And appeals to the central body if they can not agree?

Mr. SPENCER. Yes, sir; the council takes charge of local matters and adjusts, if possible, the disputes that may arise along the lines of the decisions reached by the department. If they fail to reach an adjustment or settlement they are referred to the department. And in the same relationship, all the affairs relating to the building trades in America are referred to the building-trades department and are settled by the general body.

Commissioner DELANO. In Chicago we hear a good deal—I confess I know nothing about it—of the charge that there is a limitation of output in the building trades. Is that true?

Mr. SPENCER. That charge was made quite generally and has always been made, as a matter of fact. For myself, I have never found it.

Commissioner DELANO. I have heard it spoken of very largely with the plumber—that a plumber is not allowed to wipe more than a certain number of joints in a day.

Mr. SPENCER. The plumbers presented that at one time, but it fell through. It did not last. As a matter of fact, the plumbers are doing more work to-day than they ever have done.

Commissioner DELANO. Is there such a thing as piecework in any of the building trades, or is it generally day work?

Mr. SPENCER. It is generally day work. In some of the smaller towns they may adopt a lumping system, but you will find that only in isolated cases.

Commissioner DELANO. Is there any such thing as a bonus?

Mr. SPENCER. Yes, sir; that frequently happens. You mean where a man is paid more than the scale of wages?

Commissioner DELANO. Yes.

Mr. SPENCER. Yes.

Commissioner DELANO. I mean for doing more than a certain amount of work.

Mr. SPENCER. Yes; pacemakers.

Commissioner DELANO. Do you tolerate that?

Mr. SPENCER. No, sir; they are not tolerated, but they exist just the same. Our members are not supposed to bleed the other men—make a pace, as it were—but they do. It is a common practice, especially in speculation work in the larger cities.

Commissioner DELANO. That is all I have to ask.

Commissioner BALLARD. Can anyone man belong to both these trades, the steam fitters' and plumbers' unions, if he wishes?

Mr. SPENCER. He can not very well do it, because the branches are separate. The kind of work is quite different, and if a man selects a trade like steam fitting, he becomes an adept at it, and he is best qualified to follow that trade.

Commissioner BALLARD, I was wondering how it was in the smaller towns.

Mr. SPENCER. It is not necessary then to carry two cards and belong to two unions. In the smaller towns the plumber and the steam fitter do the same work; that is, the plumber is both plumber and steam fitter.

Commissioner BALLARD. The plumbers in those small towns do steam fitting also?

Mr. SPENCER. Yes.

Commissioner BALLARD. You spoke of jurisdictional disputes. The gentleman who was on the stand before you said he thought they were local. You thing they are generally not local?

Mr. SPENCER. No, sir; it is impossible to consider them local. Jurisdictional disputes are the outcome of conflicts between the same class of unions, so that a jurisdictional dispute may exist in Chicago; that is the one that was settled in New York last week.

Commissioner BALLARD. You said the jurisdictional disputes were largely because of the employer's rather unfriendly attitude. I wondered what the employer's unfriendly attitude had to do with it.

Mr. SPENCER. His unfriendly attitude toward the plan we propose. I mentioned a plan that we had proposed to the contractors in New York, and they seem to be unfriendly to the proposition.

Commissioner BALLARD. That was to regulate these jurisdictional disputes?

Mr. SPENCER. Yes, sir; in a general way rather than in a local way. The building trades department and the unions of the building trades department, not in one trade but the international unions generally, took exception to the plan that existed in New York, which was described here rather in detail by Mr. Eidlitz. They took exception to that plan for the reason that all the employers have their organization, and then they are organized in a central body. All these local concerns are contractors, and the central body have representation on the board—the arbitration plan. On the other hand, the local unions have a building trades council, but the building trades council as such has no representation in the arbitration plan. The local unions do, but the central body has not. Consequently the thing is one-sided. There is a greater representation on one side than on the other.

Commissioner BALLARD. I thought a jurisdictional dispute was as to whether the plumber or the steam fitter should do that particular work. I did not see what the employers had to do with that matter.

Mr. SPENCER. As a general rule, they do not care. That is, I did not suppose they cared who did it.

Commissioner BALLARD. I thought it was decided by the trades-union men themselves.

Mr. SPENCER. Yes; but you have heard Mr. Eidlitz say that he took exception to the plan of the building trades department, which was aimed at the settling of these disputes.

Commissioner BALLARD. I did not understand that he objected to their settling the disputes, but it was tying up the matter until the American Federation of Labor or the local union came in and settled it.

Mr. SPENCER. Strikes generally follow, and it was for the purpose of preventing the stoppage of work that this idea was formed.

Commissioner BALLARD. I do not understand the difference between the national and the American Federation of Labor. Are the building trades not all affiliated with the American Federation of Labor?

Mr. SPENCER. Let me explain it to you. All of the plumbers and all of the carpenters and all of the bricklayers and the other trades are organized into international unions. That is, I mean to say that the different local unions throughout the country are organized into the international union of carpenters, all of the bricklayers are organized into an international union of bricklayers, and all the plumbers into an international union of plumbers, and so on right down the line. These international unions affiliate with the American Federation of Labor, so that the American Federation of Labor is the superior body in the labor movement.

Commissioner BALLARD. But it does not dictate to them what they shall do?

Mr. SPENCER. It is a purely voluntary organization.

Commissioner BALLARD. One other question about the plumbers. It has been suggested that perhaps union men only would work for plumbers who employed union men exclusively, and those plumbing establishments would be the only ones that would be allowed to buy plumbing materials from certain of these large manufacturing establishments. Is there an arrangement of that character?

Mr. SPENCER. When I was organizer of the plumbing association—the national association—I found that to be quite general—that is, I found it quite frequently, not generally. I found it where a number of unions would organize, that those unions would organize with the employers' associations, and they would agree that they would not hire nonunion men on the one hand, or they would not work for a nonunion employer on the other hand.

Commissioner BALLARD. Does that condition obtain yet?

Mr. SPENCER. I do not know. I could not say with any degree of certainty, because I have not been identified with the plumbers officially for six or seven years.

Commissioner BALLARD. At that time, then, the master plumbers, or the men who had plumbing shops, were the only men who could buy plumbing materials from certain of the manufacturers?

Mr. SPENCER. Yes. I remember a case in point where, while I was organizer, we had a strike in Dayton, Ohio. The union, in order to defend its position, was obliged to organize a plumbing shop. We immediately found that we were unable to secure supplies unless we would go to a nonassociation supply shop, and there, of course, we were confronted with high costs and poor deliveries,

and sometimes poor stocks, and all that kind of thing. We found it was absolutely impossible to buy from an association house.

Commissioner LENNON. How many members are there in the building-trades council now?

Mr. SPENCER. In the department?

Commissioner LENNON. Yes.

Mr. SPENCER. Until November—I have not cleared up our accounts since then, but up until November we had about 450,000 members.

Commissioner LENNON. And that, with two or three exceptions, includes all of the building trades of the country?

Mr. SPENCER. Yes.

Commissioner LENNON. In your experience as a building trades man, have you found it possible to reach an agreement with building contractors that did not also provide for what is generally termed the union shop? Were you ever able to negotiate agreements on what is called the open-shop proposition?

Mr. SPENCER. No; we never did. I have never known a case of that kind.

Commissioner LENNON. Does it appear to you to be absolutely necessary in the building trades, if you want joint agreements, that organization must be backed by the agreements on both sides?

Mr. SPENCER. I do not understand how you could give life and force to the agreement unless the organization was behind it.

Commissioner LENNON. Do you in your experience find what is termed the sympathetic strike—just waiving, now, for the time being, the jurisdiction matter—do you find that the sympathetic strikes for other reasons than jurisdictional reasons are as numerous as they were 10 or 15 years ago?

Mr. SPENCER. Oh, my, no; by no means.

Commissioner LENNON. Does there appear to you to be some lessening of the sympathetic strike because of jurisdictional causes, or are those strikes growing less in number?

Mr. SPENCER. Yes; I think they are. They are probably not so noticeable. But when we speak of the number of agreements that have been negotiated between international unions on disputable matters, one can not help but realize that they are growing less.

Commissioner LENNON. Could you tell us why the break-off took place in New York between that organization that was started there in 1903 by the employers and ran for about seven years? Do you know of your own knowledge?

Mr. SPENCER. No; I think Mr. Eidlitz explained the real reason of that.

Commissioner LENNON. You are satisfied with the way he explained it?

Mr. SPENCER. Yes; that it was because of the steam fitters.

Commissioner LENNON. That is all.

Commissioner DELANO. I have one other question that I forgot to ask. This may not be a fair question, and you need not answer it if you do not want to.

One of the things that one hears pretty often, especially in respect to plumbing supplies, is that there is such a close combination between the dealer in plumbing supplies and the plumber that, for instance, I can not go into a supply house and buy the most ordinary thing, like a coupling, and apply it, although it might take only 5 or 10 minutes to apply it, in my own house. I have got to give the order to a plumber or a steam fitter and have him do it? Is that true?

Mr. SPENCER. I have never known the supply houses to be so careful as to the plumbing end of it. I know they have in many cases refused to sell to local consumers, but I do not believe they are so anxious to have a plumber put it in.

Commissioner DELANO. That is all.

Commissioner LENNON. What object would be served, except that they had some combination with the operating plumber? What end would they attain by refusing to supply such things? For instance, if Mr. Delano wanted to put in a faucet, what end could be attained by the plumbing house refusing to sell to him unless it was of some benefit to be gained by dealing through a plumbing house?

Mr. SPENCER. All the reason that I can get at—of course I have discussed this with representatives of supply houses and with the head officials of these houses and with the plumbers, and the reason they advance to me is—there are so many absolutely unworthy people in the plumbing business that they are compelled to seek some kind of combination for their own defense.

Commissioner LENNON. All right.

Mr. SPENCER. Now, I would just like to say that if the proposition that I have already mentioned here that we made to the employers is of any value to the commissioner, we shall gladly furnish copies of it, of course.

Mr. THOMPSON. I should like to say, if you should care to submit any brief statement or document to the commission we would be pleased to receive it.

Commissioner DELANO. Do you not think the employers should be considered in regard to that, because they might have some objection to it, not on account of what it sought to do but on account of some other things that might flow from it? I do not imagine that Mr. Eidlitz would have anything that might settle a strike, but he might object to it on other grounds.

Mr. THOMPSON. On the general proposition it might be necessary to submit it to the whole country. Of course we are going around to the various cities, and we are going to take evidence on this building proposition from both sides, and from the public in many places, and, of course, in the course of that work we will gather a great deal of information here.

Mr. SPENCER. Let me explain to Mr. Delano. I do not believe Mr. Eidlitz would find any objection to the plan. As a matter of fact, we submitted the plan to him before it was presented at a time when he was just leaving on a vacation, and he necessarily turned it over to others. I am satisfied if a man of the standing of Mr. Eidlitz will handle this, there will be more chance for the proposition; but it is killed by subcontractors.

TESTIMONY OF MR. HENRY STRUBLE.

Mr. THOMPSON. Will you please state to the stenographer your name, address, and occupation?

Mr. STRUBLE. My business is cut stone. I am president of the Henry Struble Cut Stone Co. I have a side line, as you will see on your program. I am secretary of the National Cut Stone Contractors' Association.

Mr. THOMPSON. Will you describe the circumstances which led to the formation of that association?

Mr. STRUBLE. It was brought about by the strike in Chicago, a general lock-out in 1900. The strike, so far as the stone part particularly was concerned, was on account of the refusal of the stone-cutting trade to work in connection with machinery, and the strike brought about a certain number of stone cutters who were members of the union in Chicago at that time, who withdrew and formed another independent organization, which grew to be the National Society of Stone Cutters. I guess that probably at one time they had in the neighborhood of 3,000 members in that organization, which included New York City, Toronto, Milwaukee, Bedford, Ind., Pittsburgh, at one time Cincinnati, and there was an organization here in Washington. It was the contest over machinery that brought about the organization of the National Society of Stone Cutters.

Mr. THOMPSON. What are the policies of the Stone Cutters' Union with reference to the use of machinery and the restriction of shipment?

Mr. STRUBLE. They have waived their objection entirely as to the machine-finished product, and as to the shipment of stone.

Mr. THOMPSON. Your association has, or the stone cutters'?

Mr. STRUBLE. The stone cutters' union. The old stone cutters' union did that, which is called the Journeymen Stone Cutters of North America. They finally made it a record of their organization that they would waive those points, about three years ago.

Mr. THOMPSON. Have you a copy of the agreement existing between your association and the union?

Mr. STRUBLE. Yes, sir.

Mr. THOMPSON. Would you object to giving the committee a copy of that agreement?

Mr. STRUBLE. No, sir; I would be pleased to do so. You understand, this is between the Journeymen Stone Cutters of North America, and that the other organization has been wiped out of existence, as it were. That is, the contest between the two unions, the strife, lasted about 11 years, and finally terminated in a contract being made between the National Stone Cutters' Society of the United States and the Journeymen Stone Cutters' Association of North America, and the National Cut Stone Contractors' Association, although the principal parties to it were the National Stone Cutters' Society, who were all willing to abide by the agreement.

Mr. THOMPSON. This is a copy of the agreement?

Mr. STRUBLE. Yes.

Mr. THOMPSON. It does not seem to be very long. There is nothing on the back of it.

Mr. STRUBLE. No, sir; it is very short. It is right to the point.

Mr. THOMPSON. You might read it.

(The contract referred to was marked "Struble Exhibit No. 1," and was read aloud by Mr. Struble, as follows:)

CONTRACT BETWEEN NATIONAL CUT STONE CONTRACTORS' ASSOCIATION (INC.)
AND JOURNEYMEN STONE CUTTERS' ASSOCIATION OF NORTH AMERICA.

NEW YORK, June 4, 1913.

The following agreement entered into between the National Stone Cutters' Society of the United States and the Journeymen Stone Cutters' Association of North America and the National Cut Stone Contractors' Association of the United States and Canada, to be kept and abided by, by all parties for a term of five years.

This agreement is entered into with the understanding that the Journeymen Stone Cutters' Association of North America waive the foremanships, all stone-working machinery, shipping of stone, penalizing of National Society Cutters in any manner.

Said Journeymen Stone Cutters' Association of North America and all other parties to this agreement hereby agree to the arbitration of all questions of dispute which may arise without cessation of work during said arbitration.

They further agree that the question of setting of cut stone and the jurisdiction over this work shall be settled and determined by the parties interested.

It is understood by all parties hereto that any and all National Society Stone Cutters presenting their working cards and payment of dues from January 1, 1913, shall be received into full membership in the Journeymen Stone Cutters' Association of North America with all privileges and benefits except the death benefit, which will not be operative until six months after becoming members.

It is hereby understood and agreed by all the parties hereto that further clauses can be added to this contract to provide for details not herein set forth.

The following are named to carry out the details of this contract:

Journeymen Stone Cutters' Association of North America: Sam Griggs, W. W. Drayer, and one executive member.

National Stone Cutters' Society: W. A. Guthrie, William Gray, and one executive member.

National Cut Stone Contractors' Association (Inc.): C. G. Fanning, P. B. Parker, Henry Struble.

It is further understood and agreed that all the contracts now existing between the cut stone contractors and the National Society of Stone Cutters shall be assumed and carried out by the Journeymen Stone Cutters' Association of North America.

The parties signing this agreement hereby declare that they are empowered to sign this contract under the constitution and by-laws of their respective organizations.

WM. A. GUTHRIE,

President National Stone Cutters' Society of United States and Canada.

SAM GRIGGS,

President Journeymen Stone Cutters' Association of North America.

CHAS. G. FANNING,

President National Cut Stone Contractors' Association (Inc.).

Mr. THOMPSON. Were there any more details of agreement as to arbitrations under this contract?

Mr. STRUBLE. Not that I know of, although there is a call now for a meeting to arrange for a definite board on arbitration.

Mr. THOMPSON. Then at the present time there is no means of arbitrating, no special machinery provided any further than that?

Mr. STRUBLE. There is nothing further than that. This is to stand until a definite board is provided.

Mr. THOMPSON. They are to act as a board of arbitration?

Mr. STRUBLE. Yes.

Mr. THOMPSON. I see nine people are named here.

Mr. STRUBLE. Yes; there are three representing the Journeymen Stone Cutters' Association of North America, three representing the National Stone Cutters' Society, and three representing the National Cut Stone Contractors' Association.

Mr. THOMPSON. Whom would you take for the board of arbitrators, the last three men named?

Mr. STRUBLE. Certainly, because the others are gone now.

Commissioner DELANO. That would be two employers and one employee, would it not?

Mr. STRUBLE. No; you misunderstand me. There were two labor organizations and one organization of contractors.

Commissioner DELANO. Then there would be two labor representatives and one representative of the employers?

Mr. STRUBLE. No; one labor organization has become extinct by this agreement.

Mr. THOMPSON. That would give you, at the present time, a board of six men to decide matters?

Mr. STRUBLE. Yes.

Mr. THOMPSON. What kind of questions are apt to come up before the organizations for adjustment by arbitration?

Would they be such questions, for instance, as the discharge of a workman and discriminating against a workman in connection with the kind of work given him or any question of that character?

Mr. STRUBLE. No, sir; I do not think that anything would come before this general arbitration board unless it was the question of wages in different sections of the country.

Mr. THOMPSON. Concerning a wage scale for either a district or the whole country?

Mr. STRUBLE. Yes.

Mr. THOMPSON. What is your opinion with reference to the best method of arbitrating differences between two bodies such as you have and as to whether they should have a different number, or whether there should be any addition to the equal representation of both sides, an independent umpire or third party, who, in case of necessity, could act in bringing the parties together and in deciding matters if it became obligatory to do so?

Mr. STRUBLE. My personal opinion is that a committee, consisting of an equal number from each side of the more intelligent people in both the contractors' organization and the labor organization, will bring about a better result. So far as our system of arbitration is concerned, while it might not apply to all others, I do not believe anyway in a third outside party as an umpire at all.

Mr. THOMPSON. In the early contracts which existed, was there any specific arbitration board provided for?

Mr. STRUBLE. There always has been, locally.

Mr. THOMPSON. What has been the form of that?

Mr. STRUBLE. The form that it is drawn in is along the lines that I have explained, but with the choosing of an outside party, should the parties not be able to agree.

Mr. THOMPSON. Is that same machinery still used locally?

Mr. STRUBLE. I think so, but in my experience of 32 years it has never been referred to in the stonemasonry trade. The third party has never been called in as an umpire. If you were in the business, you would appreciate that more. It is generally a question of wages, or some matters that seem all important to those two parties that would not seem so to others, and the general conclusion is, in our business, from experience, when the question has been raised regarding a third party, that it is very easy to conclude or agree on a party, and more often than it is for the party to agree. The first thing the party wants to know is how much they pay for umpiring the job and the next thing is that it has become a known fact in our business—and that is why it has not been referred to—that it is a split; that is all it is. For instance, if the men in our trade in any city in the country will go under that arbitration agreement, and if they want an increase of wages of 50 cents a day it might be considered by an outsider that they were entitled to that, and they might ask for a dollar a day on the umpire proposition, if it goes to a third party, and the third party will split it. He will say, "What is your difference?" and "What is your difference?" and they will split it and call it square. So that I do not

think there is anything in that principle as stated the other day, that the umpire is the "goat" and I unload my troubles and you unload your troubles, and it is not what you are trying to arrive at.

Mr. THOMPSON. Then you do not believe that a third party can act as a conciliator, always, with the knowledge that both parties know that he can decide it in case he can not get them to agree?

Mr. STRUBLE. Your question always is good; but I think it would be an isolated case where an outside man could come in and arrive at what you want to get.

Mr. THOMPSON. I am thinking more, now, of systems in regard to the settlement of disputes in factories, cases where there are open or preferential shops, which you have not got, I take it?

Mr. STRUBLE. I agree with that. I am glad of it.

Mr. THOMPSON. But now taking the general subject of arbitration, would you believe that it would be improper to have a third man in such cases, cases where matters of discrimination, discharging a man because it is claimed that he is not a member of the union, or giving him poorer paid work, or a worse place to work in, and all that kind of questions which need immediate attention, are present, would you believe from your experience of that kind of a case that it would be better to have an equally divided court, or in your opinion would it be better to have a third party who would sit continuously, not brought in for a special arbitration, but to arbitrate for a year or a term of years those matters, who would sit with the two representatives, one from each side, and endeavor to bring them together on these individual cases quickly, always having the power to decide it, and by reason of that power being able to get them to reach an agreement which they otherwise would not? That is quite a long question.

Mr. STRUBLE. Yes; it is quite a long question, but it means the same thing in the end.

Mr. THOMPSON. Yes.

Mr. STRUBLE. I can see where it is necessary, of course, to have a decision in some of these things, but in the question that you have asked there, while we do not cover all of it in our contract, I have a local contract here. This general contract naturally provides for local contracts, and we as a national organization try to create a feeling which helps the stonecutters and contractors to avoid the trouble that may arise. For instance, here is this contract, which I will be pleased to leave with you if you like. It is now in existence between the Bedford local, of Bedford, Ind., and the new organization of stonecutters with whom we are dealing. This contract contains this clause:

"Eight. There shall be no discrimination on the part of the party of the first part against any member of the party of the second part because of any duties he may perform as a member of a committee or for the performance of his duties as a shop steward."

That means, in the stonecutters' parlance, the same as with other names of business, of course. I will tell you my opinion, and what I am asked to come here for is to tell my personal opinion and answer all questions as honestly as I can. Whatever conclusion you arrive at in connection with the third party in any of these labor difficulties is only a temporary arrangement. It may answer for this year, and it may for next year, but it is not conclusive in my mind. It is to put off the evil day. I am going to tell you what that is before we get through, too, if I am allowed to. Some of these other people have told you some things that were not—

Commissioner DELANO. I wish you would develop that a little further.

Mr. THOMPSON. I think he said, and I think you heard him, that he thought it was a good idea to have this independent man in the background; that his existence, even though he was not actually called on, was a suggestion to both parties that they had better try and conciliate the matter between themselves. I think in the bricklayer's case he had for years never been called on at all, but he existed as a matter of fact, and he said that his existence was a beneficial influence. What would you say as to that?

Mr. STRUBLE. I think it may be necessary to keep the wheels moving. You notice that Mr. Eidlitz said "keep him in the background."

Mr. THOMPSON. Yes.

Mr. STRUBLE. Well, that is a good place.

Mr. THOMPSON. It is the intangible influence, you know.

Mr. STRUBLE. Yes; I see.

Mr. THOMPSON. Were you at the Shoreham this morning?

Mr. STRUBLE. Yes.

Mr. THOMPSON. The same thing was said in regard to the clothing industry, that they considered it a good thing to have him, although as a matter of fact, they would call on him very little.

Mr. STRUBLE. Yes.

Mr. THOMPSON. Of course I think it goes without saying, from what you have said already, that you believe collective bargaining is the proper means of bringing the parties together in industrial matters under these trade contracts and agreements?

Mr. STRUBLE. That is true. I believe that collective bargaining, as I understand it, is conciliation, and when you get to arbitration, it is the same thing in an advanced form.

Commissioner BALLARD. I believe Mr. Delano developed the line of thought that I was working on, which I think is an awfully good one. Do you have an eight-hour day in your trade, or a longer day?

Mr. STRUBLE. For the stonecutting part of it; yes, sir; absolutely.

Commissioner BALLARD. It used to be longer?

Mr. STRUBLE. Yes; it was nine hours when I first went into the business. The stonecutters' business was one of the early eight-hour boys.

Commissioner BALLARD. Are you able, from your experience, to form a conclusion as to whether the eight hours was a benefit or not?

Mr. STRUBLE. Not working in it at the present time, I could not give you that.

Commissioner BALLARD. Who sets this cut stone in the building—the same union that made the stone—cut the stone?

Mr. STRUBLE. I think they made the agreement with the bricklayers. Before that it was set both by the bricklayers and the stonecutters; but they have fixed up an agreement so that it is now done by the bricklayers' organization.

Commissioner BALLARD. Will they set stone that is not from a union shop?

Mr. STRUBLE. I think they make only one distinction, and that is against prison-made materials.

Commissioner DELANO. There are one or two questions I want to ask. I understood you to say that this organization that we are particularly speaking of has been in existence something like 11 years. Is that right?

Mr. STRUBLE. The one that was formally closed last year; yes, sir.

Commissioner DELANO. And you are speaking from something like 32 years of experience in the business?

Mr. STRUBLE. Yes, sir.

Commissioner DELANO. In 32 years, do we understand that this method of arbitration that you are speaking of here has been successful, or was that a misunderstanding?

Mr. STRUBLE. No, sir; that is the 32 years. I never knew any case of arbitration between the contractors and the stone cutters to go to any outside party in that time.

Commissioner DELANO. How many cases a year would come up under that?

Mr. STRUBLE. Previous to the strike of 1900 there were not very many weeks went by that there were not several.

Commissioner DELANO. Would there be a cessation of work previous to the arbitration, or would it be referred to arbitration before the cessation?

Mr. STRUBLE. Both cases. They naturally strike, but this cessation of work until the arbitration was settled is something of recent times, you must understand.

Commissioner DELANO. Then, I am to understand that you were successful; there was practically a standing court appointed in advance?

Mr. STRUBLE. A standing arbitration committee from either side.

Commissioner DELANO. And that you were successful in settling this large number of cases without having a hung court—that is, evenly divided?

Mr. STRUBLE. I would say that we never had; but do not misunderstand me to say that many things were not settled by compulsion, etc., although there was an arbitration board. There were plenty of things in the days previous to the trouble of 1910 where the contractors had to come across and take what they could get, although there was an arbitration board standing. In other words, the dictatorial position of the stonecutters was such that they handled things practically to suit themselves. That is putting things pretty strong, but nevertheless it is a fact.

Commissioner DELANO. Then, your arbitration board at that time really had a great deal that it could do, because in vital questions the men would take it in their own hands; is that it?

Mr. STRUBLE. Yes. Of course it worked up from a good proposition until they handled the situation, and then the functions of the board ceased. But during the last 11 years there has not been a dispute that was not settled with the members from either side, and there was not a strike during that time.

Commissioner DELANO. Was the work entirely daywork, or some piecework?

Mr. STRUBLE. All daywork.

Commissioner DELANO. Have wages gone up a great deal?

Mr. STRUBLE. Not in proportion to other countries. Hardly in proportion to other crafts of equal ability.

Commissioner HARRIMAN. How do you account for that?

Mr. STRUBLE. I think one reason that would account for it was the contest that was on during the last 10 years, with the two unions in the field. Naturally that had quite an influence on the situation.

Commissioner HARRIMAN. Are there any other questions?

Commissioner DELANO. What proportion of the employers does your association represent, just roughly?

Mr. STRUBLE. In numbers, it is hard to give, because there is an unlimited number; but in the amount of the proportion of the work, the last time we took an inventory of that situation, the best we could, a year ago, we figured that there was 80 per cent of the stonecutting industry in the national association—it is now international; we have members in Canada as well.

Commissioner DELANO. How is it with the unions? Do they represent practically all of the stonecutters?

Mr. STRUBLE. Practically all; yes, sir.

Commissioner BALLARD. Along the line of thought in regard to this arbitration and industrial board, if there were an industrial board, would you then feel that if they did not come to any agreement within a specified time, then this matter might be left to that board of two or three arbitrators to be finally arbitrated?

Mr. STRUBLE. Yes.

Commissioner BALLARD. Would you feel that way?

Mr. STRUBLE. Yes.

Commissioner BALLARD. That it should go to the industrial board and after that go to the arbitration?

Mr. STRUBLE. Yes.

Commissioner BALLARD. You are speaking of an industrial board?

Mr. STRUBLE. We are speaking of industrial boards, either international or State.

Commissioner BALLARD. Would you advise an industrial board of that character?

Mr. STRUBLE. I would, if it was Federal.

Commissioner BALLARD. The State board would not be broad enough?

Mr. STRUBLE. No, sir.

Commissioner HARRIMAN. May I ask about what you spoke of as the "evil day" that was coming in the future and about these matters being temporary now?

Mr. STRUBLE. If the chairman will allow me to ask a few questions, I think I will explain myself, if you will pardon me.

Commissioner HARRIMAN. Yes.

Mr. STRUBLE. I must plead ignorance, as far as the board is concerned and the inception of it. Was it appointed in some way? How was it created?

Commissioner HARRIMAN. It was created by act of Congress in August, 1912. Do you want me to tell you about it? It was created to inquire into the causes of industrial unrest and to report to Congress. I will send for a copy of the act so that you may see it. There were nine members—three to represent the employers, three the employees, and three representing the public.

Mr. STRUBLE. That is more than I knew before until I got my notice to come here. Of course, I do not keep up with all these things going on in Washington, but I imagine that a great deal will come before the board that will not be what you are looking for. Of course, you will have to hear them. You have my sympathy. There are some things that appeal to me, in my own line, and from what Mr. Delano said I thought you were after some plan that would better the employer and the employee.

Commissioner HARRIMAN. That is it.

Mr. STRUBLE. There are one or two little things that you want to take into consideration when you come to a summing up. We have labor organizations, and there is one question that must appeal to you to start with, and that is, Why does labor need to organize? The answer to that, in my experience, is just two things: That it is a lack of confidence and it is a competition among men who have nothing to sell but their labor.

On the other hand, Why does the capital organize? Exactly for the same reason—a lack of confidence, one with another, and the competition that is created between them. There is no difference, in my way of looking at it, between organized labor and organized capital.

In giving this matter serious consideration it is going to apply equally to labor and capital. You have to concede the fact that you are always going to have capital and labor. I expect there are always going to be classes in this country. We have grown along so fast and labor has organized and capital has organized, and there are just two things now that the Government does that interfere with those two organizations, as I see it. On the other hand, the organization of contractors, every time they get together in a room and shut the door and have a star-chamber caucus some attorney comes along and says, "We have the Sherman law that you have to be very careful about." That part of it the Government is interested in—up to that point. Now, as to the labor part of it, the labor, we will concede—may I say it from the opposite side—anyhow, has least interference from the Government; but the labor has to fear the matter of injunction, which has been tried to be put out of the way here, during the work here in Washington.

Now, you have got to concede that the labor has organized for certain reasons, and so has capital, and now when it comes to the contractor, you are being interfered with by the acts of both. The labor end of it is not doing any more harm probably to the progress of the country and going along without trouble than is the contractor who, in his overexertion and competition, is making things ruinous for the whole country. In other words, there are two conditions there. In other words, there is a condition of lack of confidence between everybody—a man and his wife sometimes. That ought not to be so, but it is, and it applies all along the line.

The condition that has got to come in this country, in my mind, borders right on the line of your talk of the arbitrator; and if this is going to come when the Government comes in and says, "Thus far and no farther; you may make your agreement, Mr. Struble, with your stone men for a conciliatory board and an arbitration board, but there has got to be a place where the arbitration stops and the strike stops and business goes on"; and that is where this third party now is of no particular account except as a temporary arrangement. This has got to be a Federal proposition. In Illinois we have a board. I do not know what they call them, but every time there is a labor trouble they send in and want to know if they can be of service, and we say, "No," and then they come, anyhow. [Laughter.] They hear your tale of woe, and then they sit around and look wise. What is the name of that board?

Commissioner DELANO. The committee of mediation, I believe.

Mr. STRUBLE. They have no power to act.

Commissioner DELANO. And no standing there.

Mr. STRUBLE. No power; and this is another makeshift; and, I believe, in my short experience with the Government—and I have thought for the last 15 years that the Government has got to have—the Federal Government has got to have—somebody that says "Good night," as the case may be, with this matter of meetings.

I attended a meeting in Chicago a few years ago, and Mr. Gompers was there, and they had a lot of leading lawyers, and they had some bright fellow from Australia and from New Zealand, and I wore myself out for about a week, and I think it was forgotten by the time they got home. I forgot it, anyway. I am saying this to this board just on a few remarks that Mr. Delano made when Mr. Eidlitz was on here, and I am saying these things as I see them. I came from Chicago at the expense of this committee. I suppose they contribute to the expense of those people they are bringing here. I do not know how they are going to settle it.

So far as I am concerned, I will welcome—

Commissioner BALLARD. You are not the only man who is up against that proposition.

Mr. STRUBLE. I know; it is like all these other propositions—misery loves company.

Commissioner BALLARD. Do you not think you might say to Mr. Struble, Mrs. Harriman, as you have to others, that you would be glad if he would submit a brief?

Commissioner HARRIMAN. How do you feel about the idea of an industrial council that should be individually appointed by the Federal Government—a Federal board; something on the lines of the one they have in England—that will settle all these troubles and do about what you say you want done?

Mr. STRUBLE. With power to act?

Commissioner HARRIMAN. With power to act.

Mr. STRUBLE. With power to act, I think it would be welcomed throughout the world.

Mr. THOMPSON. That is not so with the English board.

Mr. STRUBLE. Then, there is where they are weak.

Mr. THOMPSON. Do you believe, from the world experience on compulsory arbitration, that it is a success? Has it not been proved to be a failure wherever it was inaugurated?

Mr. STRUBLE. I do not believe it was handled by as bright minds as we have in this country.

Mr. THOMPSON. We do not seem to have gotten along any further than anybody else in industrial development, according to all contemporary history. How can you compel a man to work if he does not want to work?

Mr. STRUBLE. That is impossible.

Mr. THOMPSON. Then, how can you compel, by power, the settlement of industrial disputes?

Mr. STRUBLE. In this way: If there are those who do not want to work, and you can not compel them to work, there are those who do want to work if they are allowed to work. There never was a time in the history of the world when there were not those who were willing to work. Why could they not work? Because there was no protection. If somebody is going to lie down and say, "We will not do it," then the industrial board will come in and say, "You take this."

Mr. THOMPSON. We must take into consideration the result that occurs, must we not?

Mr. STRUBLE. Yes.

Mr. THOMPSON. In New Zealand I understand that the Government made a decision in regard to an industrial matter, and it undertook to compel the observance of it; and I understand to-day in that far-advanced colony they have gatling guns and soldiers and all that trying to enforce the decision of a board of arbitration; and I think the decision is enforced, and they have soldiers and guns there, and nothing is doing; that is all there is to it.

In other words, have you not got to emphasize the idea of deciding a thing justly and then letting the force of public opinion stand back of that? And, after all, is it not a greater power in the settlement of industrial matters?

Mr. STRUBLE. To answer you, I think you take that too seriously when you speak of enforced arbitration. There is not a case that I know of that has come to arbitration where a third party has been called in, but what it has been settled. I may consider that it was unjustly settled. But you heard Mr. Eidlitz say to-day that when a man acted as umpire here in New York, he served only once. We want a board paid by the Government that will say: "You shall serve as long as we want you." The action of this board would be conciliatory, in a way.

Mr. THOMPSON. In regard to this matter of conciliation and arbitration—and we have gone into so many things that we are pressed for time—the question of arbitration, even the question of a third man, and all that, depends, like the organization proposition, on the spirit in which the thing is done as much, if not more than on the machinery involved. Now, if either party to a dispute feels that the third man is ignorant of the trade conditions and is simply trying to unburden his mind and get rid of the proposition, and has made a sort of a toss-of-the-coin decision, when he feels he has got the worst of it he is naturally aggrieved, and is dissatisfied with the result. But there is a new theory growing up, as I understand it, with regard to the arbitration of matters by a third party. It is not for a man unacquainted with the conditions of the trade to give a knockdown decision, so that the side that is the victor may feel that he got more than he is entitled to and it can not succeed, but in that whole

thing should be the spirit that the third man should use those powers to persuade the two sides to get together, and be resourceful enough, and have that spirit of trying to be resourceful, to provide ways in which the parties can agree, and this spirit of bringing the parties together. In other words, the third man using the spirit of conciliation, the parties will get so close together that although he does have to make a decision the difference will be such a small matter that it does not make much difference. With that absolute spirit of conciliation and arbitration is it not likely that we would make more progress than under the old theory of the board deciding it with a club, or the Government deciding it with a club?

Mr. STRUBLE. I do not look at it as you do, as to the club part of it. Now, if we got into an argument we would have a good one. I am not much on the arguing, but I will say this: You can take this agreement that I presented to you to-day, and you can take any other agreement that will be brought in here between labor organizations, such as this New York protocol, as I believe they call it. That name does not fit with the building business.

Mr. THOMPSON. The name has worked, anyway.

Mr. STRUBLE. I may be very strong in my opinions, but the agreements that you are working under to-day with labor in this country are gentlemen's agreements, and that is all they are. Then as soon as something goes wrong Mr. Eidlitz told you how they do in New York, and that is not the fairest example of conditions in the country. Do not take it too seriously. There is not a city to-day in the country like New York. I am not going to tell any tales out of school, but you want to understand me that there is a hole there that you can get things out of, but you can not get anything in. In other words, they build a fence around the city and say to Mr. Bricklayer and Mr. Stonecutter, and so on, "You come and play in my back lot, and I will play in yours;" but they do not play in any of them. They do not, down in New York. That is not a fair criterion for the rest of the country. I will tell you a few things that I know, and maybe I will slip a few; but that is the situation.

Mr. THOMPSON. Does that appear in there [indicating book]?

Mr. STRUBLE. If you try to sell any cut stone there you will find out. I know that I can not sell any there; but I can go up to New Haven and build a lady a nice house there. They have the labor there and the money in hand to do it, just as Mr. Spencer does.

Mr. THOMPSON. Why did you not slip one over while he was on the stand and we would have put that to him?

Mr. STRUBLE. I was not asking him questions.

Mr. THOMPSON. We are going to reach New York anyway.

Mr. STRUBLE. You are going to get there, I understand, and you will find the situation there as it is, even though it is not as I say.

Mr. THOMPSON. I think you are right about that, too.

Mr. STRUBLE. I think this commission ought to have all the assistance possible in what they are trying to do, because they are going to bring a good result out of it; but you have got to get a fair and square deal wherever you go.

Commissioner HARRIMAN. Have you any other suggestions? You said that you had several you wanted to make.

Mr. STRUBLE. Everything I had to say came under that one head. That is what it was leading up to, that it has got to be an industrial board with power to act, and it has got to be a Federal Government board, too.

Commissioner DELANO. If I understand your point, you mean there will be an industrial board that will have the same conditions in industrial affairs as the Supreme Court does in legal, civil difficulties?

Mr. STRUBLE. Yes.

Mr. THOMPSON. We have all got to abide by the decisions of the Supreme Court in law suits.

Commissioner BALLARD. Have the stonecutters ever objected to the introduction of new machinery for handling and cutting stone?

Mr. STRUBLE. Certainly; that was what the trouble first arose about, the planer and the lathe.

Commissioner BALLARD. Has that all been adjusted?

Mr. STRUBLE. They agree to it now; yes, sir; as this contract states. That is how we could come together. We have waived those objections to the stone-working machinery and the shipment of cut stone. There were only three or four questions that hung fire for 11 years.

Commissioner HARRIMAN. If that is all, we thank you very much.

(The second contract presented by Mr. Struble was marked "Struble Exhibit No. 2," and is as follows:)

AGREEMENT BETWEEN THE BEDFORD STONE CLUB (MEMBERS OF THE NATIONAL CUT STONE CONTRACTORS' ASSOCIATION) AND THE BEDFORD BRANCH OF THE JOURNEMEN STONE CUTTERS' ASSOCIATION OF NORTH AMERICA.

First. This agreement witnesseth that the Bedford Stone Club (designated as the party of the first part) hereby agrees to employ as stonecutters and carvers only such men as may be members of the Journeymen Stone Cutters' Association of North America (party of the second part): *Provided, however*, The said Journeymen Stone Cutters' Association of North America, above mentioned, shall at all times furnish and provide such number of skilled workmen as shall be required by the members of the Bedford Stone Club. Any failure on the part of the said Journeymen Stone Cutters' Association of North America to provide a sufficiency of men after two weeks' notice shall confer the right to the members of the Bedford Stone Club to employ such stonecutters and carvers as they see fit, and such men so employed shall at once make application and be permitted to join the Journeymen Stone Cutters' Association of North America upon their payment of the initiation fee that may govern similar cases.

Second. The wages of the journeymen stonecutters shall be fifty-seven and one-half (57½) cents per hour from January 12, 1914, to June 30, 1914, and sixty (60) cents per hour from July 1, 1914, to January 12, 1915. This rate of wages shall not apply to superannuated members, for whom a class shall be provided, designated as exempt.

Exempt members shall be at liberty to make the best terms possible with their employers.

Third. Eight (8) hours shall constitute a day's work, and no more than forty-eight (48) hours shall be worked by any stonecutter or carver in one week. Full time on Saturdays the same as other week days.

Fourth. The party of the second part shall recognize the right of the party of the first part to subcontract carving, and the wages of carvers shall be one (1) dollar per day in excess of stonecutters' wages.

Fifth. It is mutually agreed by the parties hereto that no labor shall be performed on the following holidays: Thanksgiving, Decoration Day, Fourth of July, Labor Day, and Christmas Day, or Sundays.

Sixth. All pneumatic hammers and tools to be used with same shall be furnished by the party of the first part.

Seventh. The wages of the party of the second part shall be paid alternate Saturdays, in cash or check, at the mills where the men are employed before quitting time. The week shall end on Friday.

Eighth. There shall be no discrimination on the part of the party of the first part against any member of the party of the second part because of any duties he may perform as a member of a committee or for the performance of his duties as a shop steward.

Ninth. It is also mutually agreed that the terms of the agreement entered into between the National Cut Stone Contractors' Association and the Journeymen Stone Cutters' Association of North America shall be recognized as part of this agreement.

Tenth. It is mutually agreed by and between the parties hereto that this contract shall remain in force and effect for the period of one (1) year beginning on the 12th day of January, 1914: *Provided, however*, That no changes are requested by either party to this agreement before October 1, 1914, said agreement is to remain in full force and effect until January 12, 1916.

Eleventh. Apprentices: The number of apprentices to be employed by the party of the first part shall be as follows:

One (1) apprentice to five (5) or less members employed.

Two (2) apprentices to over five (5) and less than fifteen (15) members employed.

Three (3) apprentices to over fifteen (15) and less than twenty-one (21) members employed.

Four (4) apprentices to over twenty-one members (21) employed.

Apprentice wages: The wages of apprentices shall be optional with the party of the first part.

Twelfth. It is mutually agreed between parties hereto that this agreement shall be submitted to the executive committee of the National Cut Stone Con-

tractors' Association (Inc.) and the executive board of the Journeymen Stone Cutters' Association of North America for final ratification and approval.

In witness whereof we, the duly authorized empowered representatives of our respective associations and societies, hereunto set our hands and seals this 7th of January, 1914.

Bedford Stone Club:

ARTHUR MICHIE,
A. E. DICKINSON,
ROBT. REED,
CARL FURST,
HENRY STRUBLE,
Committee.

Bedford branch of the Journeymen Stone Cutters' Association of North America:

CHAS. S. AUSTIN,
THOMAS BRENNAN,
ROBERT E. HOLT,
ANDREW LINDSAY,
JOHN MCR. MATHESON,
Committee.

TESTIMONY OF MR. THOMAS J. WILLIAMS.

Mr. THOMPSON. Will you please give your name, residence, and business?

Mr. WILLIAMS. Thomas J. Williams. I am president of the building trades department of the American Federation of Labor. Residence at present in Washington.

Mr. THOMPSON. What trade do you belong to?

Mr. WILLIAMS. My own particular trade?

Mr. THOMPSON. Yes.

Mr. WILLIAMS. Encaustic tile laying.

Mr. THOMPSON. Where were you employed in that trade?

Mr. WILLIAMS. Pittsburgh, Pa.

Mr. THOMPSON. Are there any collective agreements or trade agreements between that union and firms?

Mr. WILLIAMS. We have had agreements for, possibly, to my knowledge, 20 years.

Mr. THOMPSON. Mention one, for instance—a typical agreement.

Mr. WILLIAMS. In Pittsburgh?

Mr. THOMPSON. Yes.

Mr. WILLIAMS. I will say in Pittsburgh we have had in my own trade agreements, to my knowledge, for about 20 years.

Mr. THOMPSON. In a general way, what has been the subject of those agreements?

Mr. WILLIAMS. There is an association of manufacturers in the particular line, and, of course, a union, and they have yearly, or possibly every three or four years, met and drawn up the agreements.

Mr. THOMPSON. From your experience of 20 years under such agreements, are you of opinion that they are good things for the labor people?

Mr. WILLIAMS. Absolutely.

Mr. THOMPSON. Do you believe that the labor people, dealing collectively, can better protect their interests, such as their wages, hours of labor, and conditions for working?

Mr. WILLIAMS. Absolutely.

Mr. THOMPSON. You think, then, they have an advantage over the individual in dealing with the boss?

Mr. WILLIAMS. According to our present-day condition—and I am speaking of the building industry—individual bargaining is an impossibility, for practical purposes.

Mr. THOMPSON. In connection with your contracts did they have any provision for the settlement of disputes?

Mr. WILLIAMS. Oh, yes.

Mr. THOMPSON. What were those provisions, if you know?

Mr. WILLIAMS. Of course, this pertains to one trade with their employers in one particular city, you know. This is not a general proposition. This is not factory work. This is all on the buildings. If there is any dispute of any kind

they have a joint executive board, an executive board of the association of employers, and an executive board of the union, that meets at stated intervals, even going so far that if work is improperly done this joint executive board shall decide whether it is the workmen's fault or not.

Mr. THOMPSON. What is the membership of that board, odd or even?

Mr. WILLIAMS. Generally it is five on each side.

Mr. THOMPSON. What class of questions generally come up before that board, and specifically, do they involve in many instances the grievance of an individual workman?

Mr. WILLIAMS. Yes, at times; but not very often.

Mr. THOMPSON. Generally they are larger questions?

Mr. WILLIAMS. Yes, sir.

Mr. THOMPSON. Matters of policy and trade agreements?

Mr. WILLIAMS. Yes.

Mr. THOMPSON. And for such questions you think that the even board is the best board?

Mr. WILLIAMS. Yes; I think so.

Mr. THOMPSON. Have you any opinion and any experience with reference to the use of boards of arbitration in factories, or in cases where there are open-shop arrangements?

Mr. WILLIAMS. In factories?

Mr. THOMPSON. Yes.

Mr. WILLIAMS. I must confess that I have very little practical knowledge of the working conditions in factories.

Mr. THOMPSON. Then you have no opinion as to which character of board, a board without an umpire, or a board with an umpire, would be best in such cases?

Mr. WILLIAMS. No, sir; I would not like to advance an opinion, because my work has been confined to buildings, and I have not any opinion that it would be of use to this commission to advance.

Mr. THOMPSON. Of course, it goes without saying that you believe in the settlement of disputes without a strike?

Mr. WILLIAMS. Absolutely, and it applies particularly in the building industry.

Mr. THOMPSON. That is all that I care to ask.

Commissioner LENNON. Mr. Williams, you have some general knowledge of the conditions existing between the building trades contractors and most of the unions, have you not, in most of the trades?

Mr. WILLIAMS. Yes, I have; I suppose I ought to have, and I have a general knowledge of those conditions throughout the country.

Commissioner LENNON. And in Pittsburgh you were usually active in a general way in connection with these trade matters, were you not?

Mr. WILLIAMS. I was president of the building trades combination in Pittsburgh for about 10 years.

Commissioner LENNON. What did you find, in Pittsburgh, during the term of your years there, to be the conditions as to the possibility of decent living as between employees who are in unions in building trades, and in some instances where employees were nonunion? How did their conditions compare as to wages and hours and treatment generally, or was there any difference?

Mr. WILLIAMS. That is rather a peculiar condition in the building industry.

Commissioner LENNON. I know it is.

Mr. WILLIAMS. In this respect, that the nonunion man is able to get all the fruits of the labor or work of the union man, and apparently is able to get the same wages as the union man, and he frequently quotes that to you, using the usual term, "I get the wages." You analyze the thing and you will find that he gets the wages through the efforts of the union being able to establish the rate of wages. Of course where he does not his condition is not as good. His opportunity for getting work is limited; he is more under the orders of the employer, and he has to-day in his work longer hours than he would have, of course, if he was living under the terms of a written agreement; and, of course, his conditions generally will not compare with those of the union man.

Commissioner LENNON. Were you ever up at Altoona, for instance?

Mr. WILLIAMS. Yes; and have worked in Altoona quite frequently.

Commissioner LENNON. Is that a well-organized city, like Pittsburgh, in the building trades?

Mr. WILLIAMS. No; it is poorly organized.

Commissioner LENNON. What do you find the condition there as compared to Pittsburgh?

Mr. WILLIAMS. The conditions do not compare at all.

Commissioner LENNON. What does a bricklayer get in Pittsburgh, and what does he get in Altoona, if you know? Or, take your trade, tile laying?

Mr. WILLIAMS. The bricklayer is not a fair criterion.

Commissioner LENNON. Yes, I know; that is true.

Mr. WILLIAMS. The other trades would not, in the building industry, get anything like as much in Altoona as they would in Pittsburgh.

Commissioner LENNON. Do you ascribe this to the fact that there have been contractual relations between the building trades in Pittsburgh, and there have not been such relations in Altoona, or is there some other reason for it?

Mr. WILLIAMS. The reason at the bottom of it all is that the individual unions are not as well organized, and therefore they can not be as well organized collectively. You see, it is not alone in the building industry now, the fact that the individual trade may be well organized into a union, but the fact that they are collectively as unions well organized.

Commissioner LENNON. Have you come considerable in contact with these vocational disputes that exist in the organizations—between the organizations?

Mr. WILLIAMS. That is my unfortunate position, to have occasionally tried to adjust them.

Commissioner LENNON. Does it appear to you as though the tendency was in the direction of their elimination?

Mr. WILLIAMS. Of course, this may not be understood or appreciated by the members of the commission, but if the different trades would reasonably live up to the laws as laid down by the building trades department we would eliminate 95 per cent of the disputes in the building industry for the United States and Canada.

Commissioner LENNON. What seems to be the particular object with these particular trades that keeps them from taking hold in this effort of the building trades to settle these matters? What is it that they see that stops them?

Mr. WILLIAMS. I may be wrong in my analysis of the whole subject, but I have thought, if I may be allowed to express this opinion, that if a body of practical men sat down and devoted all their efforts honestly to devise laws to govern—I am speaking particularly of the building industry—the building industry, and they did finally devise a set of laws or define a constitution such that finally it depends on the individual carrying them out, with this restless feeling that is engendered in nearly everyone of us in this country at the present day, a feeling that they will not abide by any given rules, you will find that regardless of what is done in framing the law, a combination of individuals will say “Well, we have power enough to think otherwise or do otherwise”; and the result is that the laws will not be lived up to. So it all depends on the individual, anyway.

Commissioner LENNON. In other words, you seem to think that where a certain party feels strong enough to resist the suggestions made by the building trades department, they simply resist, that is all—do not “come across,” as the boys say?

Mr. WILLIAMS. It is too bad.

Commissioner LENNON. How are the building trades organized now, as compared to when you started to work in this part of the country?

Mr. WILLIAMS. Oh, much better.

Commissioner LENNON. They are much better organized?

Mr. WILLIAMS. Yes.

Commissioner LENNON. Are the wages increased?

Mr. WILLIAMS. Very much.

Commissioner LENNON. At that time was an 8-hour day in existence in any of the trades?

Mr. WILLIAMS. No; not when I started. It was a 9-hour day.

Commissioner LENNON. Now, it is generally, is it not, an 8-hour day?

Mr. WILLIAMS. In the building industry, with the possible exception of what is known as building laborers—and they have in some cases 9 and 10 hours, because they have to prepare certain materials for the mechanics to start with early in the morning, and so they have to start half an hour or an hour earlier than the mechanics.

Commissioner LENNON. One of the important things that this commission is to study is the causes of industrial unrest. Of course, that is a broad proposition, but you understand what it is. The enactment of the law creating this commission grew out of many things, but perhaps especially out of troubles in the structural iron trades, and out of the contest that was on in Lawrence,

Mass. Perhaps those two matters particularly brought to a head the movement that created this commission.

What do you consider the principal causes of unrest that exist among the organized workers of the country, as far as you know?

Mr. WILLIAMS. How would you desire me to answer that? There is unrest, of course, in regard to jurisdictional matters.

Commissioner LENNON. Oh, yes; of course.

Mr. WILLIAMS. And then there is an unrest in regard to underlying conditions which have nothing to do with jurisdictional matters. How would you have me answer?

Commissioner LENNON. As to the discontent with conditions that surround the workman.

Mr. WILLIAMS. In the building industry at the present day I believe there is less unrest than formerly, and I believe there is less unrest in the building industry than in any other line of work. Of course, I might say this, that owing to the fact that the building industry, I suppose, is as well organized as any in the country, they having a better understanding with their employers, there is less cause for unrest; because I believe that the combinations of workmen in the different unions in the building industry have brought to a higher state of perfection the principle of arbitration and conciliation and agreements relating to it than any other combination of unions.

Commissioner LENNON. And that has eliminated unrest, or rather that has brought about conditions that make the unrest less noticeable among building-trades people than among factory people, say?

Mr. WILLIAMS. Yes. You find in the country that it is less noticeable, that there is less serious disturbance in the building industry than you will find in what is known as the miscellaneous trades.

Commissioner LENNON. That is all I care to ask.

Commissioner DELANO. Mr. Williams, you have given the impression, from your evidence, that there is less trouble in the building trades than there is in other trades. I have gotten the impression, as a resident of Chicago, that there is more trouble in the building trades, and that we have more strikes and more trouble and more friction than we have in most other trades. Is that a wrong impression?

Mr. WILLIAMS. I take it this way, that I believe the disturbances in other trades more seriously affect the whole community and the country, and therefore they are more noticeable than those in the building industry, because a strike in the building industry may cover just one building, and while that is of course important to the city, to the community, yet the strike in that one building is relatively not so important as one strike in one large factory would be.

Commissioner DELANO. That is so; but yet all building operations stopped in Chicago entirely last summer or in the early fall, for two or three months. We had a case of a man—I think he was a steamfitter—shooting a plumber, or something like that, the trouble growing out of a jurisdictional fight. We have had some pretty serious matters of that kind.

Mr. WILLIAMS. Possibly, but that was not so recent as that?

Commissioner DELANO. This shooting business was not recent. That was two or three years ago, I know; but I mean the cessation was last summer, was it not?

Mr. WILLIAMS. Yes, it was; and as the result of that there was an agreement drawn up between the employers and the local council there.

Commissioner DELANO. You do not think there has been more trouble; you still think there has been less trouble in the building trades?

Mr. WILLIAMS. I speak nationally, of course.

Commissioner DELANO. Nationally?

Mr. WILLIAMS. Yes.

Commissioner DELANO. Has Chicago been particularly unfortunate?

Mr. WILLIAMS. In Chicago there has been a tremendous rise in building operations for the last five or six years. Prior to that things were rather dull. In fact, immediately following the world's fair things became very stagnant, and as they grew better, that of course brought out questions that while things were quiet, were lying dormant, and when they saw so much work they became a little ambitious as to what they should get, and as a result I believe wages would be considered higher in Chicago than in almost any other city in the United States, with the possible exception of San Francisco.

Commissioner DELANO. Ought that not to have made for contentment rather than for friction?

Mr. WILLIAMS. It will do so, finally; but it is in the process of making.

Commissioner BALLARD. In the case of a jurisdictional dispute, as for instance, between the plumbers and the steamfitters, and I take those because they have been used by way of illustration, that would come to you as president of the building trades department of the American Federation of Labor, would it not?

Mr. WILLIAMS. It would under ordinary circumstances, but it will not any more because it is all settled.

Commissioner BALLARD. That particular dispute; but in case of a jurisdictional dispute it would come to me because of your position?

Mr. WILLIAMS. Yes. If I may be allowed to explain, of course, a jurisdictional dispute generally comes up in a given city. The trades involved frequently apply to their respective international unions. In the event that all these building trades are affiliated into one local building trades council, the matter is referred to that local building trades council. Then they try to adjust it. I take it that in a large number of cases they try to adjust it on the national laws of the building trades department. Failing to arrive at a satisfactory conclusion on it then they carry it to the headquarters of the department, and of course then it comes to me. The policy pursued is, if it is of course a very flagrant case, the president of the department decides at once in favor of the particular trade that rightfully owns the work. If there is some little doubt the president of the department will refer the matter to the presidents of the two international unions, and tries to get them to see the light and so instruct their respective locals. If that fails, the department has a law that the president of the department has the right to appoint an arbitrator who shall visit the city where the dispute is on, and the two unions—it will be usually two unions, and seldom if ever three—would have their representatives present the case. Of course he is a building tradesman, and he, after thoroughly investigating the case will render a decision. That decision is supposed to be lived up to, and the union having the decision rendered against it has the right to appeal at the next convention of the department.

Commissioner BALLARD. But in the meantime the work must go on.

Mr. WILLIAMS. And we have a very strong and specific law that there shall be no stoppage of work in any place or at any time on a jurisdictional matter; and any trade that does stop work on account of a jurisdictional dispute is simply violating the law. And that comes back to what I said, that no matter how you devise laws, no matter how good they are, it rests with the individual, because of course we have no compelling power to compel a compliance.

Commissioner BALLARD. There is no machinery to compensate the owner of the building for losses in time?

Mr. WILLIAMS. No; but I have known cases where a local went out, not on a jurisdictional matter, but went out in violation of an understanding that they had with the local council, and asked for more wages and were able to get them, and were afterwards compelled to come back again at the old wages and to return the money they had gotten over and above the former wages.

Commissioner BALLARD. Are all the unions in the building trades open? At any time can a person raised in that trade, not a member of the union, join the union, or can a member move from one town to another and join the union in the place to which he moves?

Mr. WILLIAMS. They have a very excellent arrangement with the different unions who control their own autonomy, of course. If I am a plumber here in Washington and I find that trade is slack here, all I have to do is to take a clearance card or a traveling card and go to Chicago, and without the payment of one cent of money I can become a member, a full-fledged member of the local there, entitled to all the privileges of a man who is a resident of Chicago; and that applies to all trades. All trades have what is called a clearance card or a traveling card, and all the members have to do is, when they go into another city, under the jurisdiction of another local, to just pay the same amount of monthly dues, and that would be known as a home card for the party.

Commissioner BALLARD. That applies to all the building trades in the country and in all the cities in the country?

Mr. WILLIAMS. To all the building trades and in all the cities. In my own particular trade I can go to any city in the country and become a full-fledged member with all privileges, without paying one additional cent of money. Then of course there are death benefits and sick benefits, and in some cases the loss of tools is covered by benefits, and there are out-of-work benefits.

Commissioner BALLARD. Have all the unions the same provisions in that regard?

Mr. WILLIAMS. Yes. I might explain to the commission the full meaning of that. I may be mistaken, but if you do understand it will not hurt. I do not think you understand the full meaning of what a building-trades union means.

Mr. BALLARD. No; we would be glad to have it explained.

Mr. WILLIAMS. The American Federation of Labor is the basis, of course, of all trades. There are, of course, a few organizations outside of the field of the American Federation of Labor, but they comprise all industries. In their annual convention, where they legislated supposedly for the benefit of the different trades, it was found that matters pertaining to the building trades could not be adequately taken up and covered, and therefore it was decided by the building-trades men themselves that in order to more thoroughly cover their own industry they would establish themselves in a department; but it practically is the American Federation of Labor. But in order to properly carry out the work particularly covered by building trades they determined that they would have a department of building trades.

All the building trades in this country are affiliated, with the exception of the bricklayer, who is not affiliated with any organization in this country. Just at present the large organization of carpenters, owing to an internal matter, has seen fit to withdraw, but they of course are still members of the American Federation of Labor. Of these different internationals of the different trades there are 19. There would be 20 building trades in the country without counting the bricklayers. Counting the bricklayers, there would be 21, but we are not counting the bricklayers. These organizations meet in convention immediately after the American Federation of Labor convention, and, of course, they are a legislative body, the same as the American Federation of Labor; they are represented by delegates from the international unions, and they establish laws for the benefit of the building trades, you see. In order to properly carry out the full meaning of this in the different cities of the United States they establish local councils of unions of the internationals. For instance, in Chicago there would be unions representing every one of these internationals. In other words, there would be 19 different crafts represented in the Chicago council; but in the Pittsburgh council, you see, or in the Washington council, in this city—and they are all affiliated with the department, of which we have our headquarters in Washington—they do not themselves legislate. It is the international unions that meet in convention that legislate. The locals of the councils are supposed to carry out the laws that are enacted at the convention, and the department issues a universal building-trades card to all these different local councils.

So if you hear the term "local council," it must not be confused with the department as a national body, although they are all affiliated.

Commissioner HARRIMAN. That is awfully interesting, but I think all of us have gotten more or less away from the question before us, which is arbitration and conciliation, and the time is getting so short I am afraid we shall have to go on and confine ourselves to that.

Commissioner DELANO has some questions he wants to ask.

Commissioner DELANO. I want to be sure I understood Mr. Williams on one question. I understood you to say that the bulk of the difficulties were settled by a board of five men on each side.

Mr. WILLIAMS. That is, in a locality.

Commissioner DELANO. In a locality?

Mr. WILLIAMS. Yes; in a city. That does not apply nationally.

Commissioner DELANO. What happens if that board is deadlocked or is even?

Mr. WILLIAMS. The argument against an even board, of course, is that you may get a deadlock.

Commissioner DELANO. Does that happen?

Mr. WILLIAMS. Not very often; but when it does, and there happens to be a local building-trades council, they apply to that council to appoint a committee.

Commissioner DELANO. Then what does that committee do? Do you mean an odd-numbered committee?

Mr. WILLIAMS. Yes; possibly a committee of three. But it seldom or never happens just in a local affair in that way. Of course, when they do not agree, I am sorry to say, then there is a strike.

Mr. THOMPSON. That is the way they finally adjust it?

Mr. WILLIAMS. That is where the strikes start from. For instance, when a scale between a local union and its employers expires and they meet, say, a month or two months before the expiration to draw up a new one, and they

finally fail to agree, unless some extraordinary efforts are made on the part of the local council there is a strike on the part of the union.

Commissioner DELANO. Mr. Thompson would naturally think that the way to solve that would be to have an umpire. Why do you not have an umpire?

Mr. WILLIAMS. In local matters covering local unions they have not, as a rule, reached that point where they even think of appointing an umpire. It is too bad that they should have to resort to the strike, but it is done.

Commissioner DELANO. How do you feel about it?

Mr. WILLIAMS. It all depends upon who your umpire would be; not whether his name may be Mr. Smith or Mr. Brown—I do not mean it in that way—but I mean whether he would be what would be considered really somewhat competent to judge of the matters in dispute.

Commissioner DELANO. You heard what Mr. Eidlitz said about it. He apparently thought that it was necessary to have an odd man.

Mr. WILLIAMS. Well, I am applying this particularly to a local union, not to a combination of unions or a combination of employers, where the problem would be a little harder to solve. A local union can know their own particular needs so well, and their employers in that particular industry also know their own needs so well that they are generally able to adjust matters without the need of an outside man.

Commissioner DELANO. What do you mean by "generally;" what percentage of the time?

Mr. WILLIAMS. I should say 85 per cent. Take a dispute with a local union in drawing up a scale. There is where the principal conflict comes in, in drawing up the terms of a scale or agreement for that particular local union. I would say there it was about 80 per cent. I would say in most cases, or in 80 per cent of the cases.

Commissioner DELANO. We have had very contradictory evidence on just this point. The suggestion has been made that if you had in the background an umpire who would be called in in case of the ten men failing to agree, it would cause the 10 men to agree. Others have said that if you had a man in the background, it would cause a disagreement, because the temptation would be to pass the buck to him; to "make him the goat," was the actual expression, I think. How does that work in practice?

Mr. WILLIAMS. As it would apply to what I have heretofore called—and I have to repeat the term—a local union matter—I have had very little experience of the necessity of having an umpire. It is all right in general matters, but not where local unions are concerned.

Commissioner HARRIMAN. If that is all, we are obliged to you.

TESTIMONY OF MR. EDWARD A. CRANE.

Mr. THOMPSON. Mr. Crane, will you state your name, residence, and occupation?

Mr. CRANE. Edward A. Crane, Philadelphia, Pa.; an architect.

Mr. THOMPSON. Did you receive a communication from the commission stating the purposes of this meeting, or not?

Mr. CRANE. Yes; at the very last moment. I came here very hurriedly. I received a telephone message asking me if I would come, from the American Institute of Architects, and received the note on the way from my office to the train. I did not read it until I was on the train.

Mr. THOMPSON. With reference to the question of collective bargaining; that is to say, bargaining between the employees as a body and the single employer, or the employers as a body, have you had any experience?

Mr. CRANE. I can not say that I have had any particular experience in that way. An architect is not apt to have anything to do with the employment of labor.

Mr. THOMPSON. Yes; I understand that, but does not the architect have a great deal to do with that question in the building trade when strikes occur, where there is a possibility of trouble?

Mr. CRANE. Well, his dealings in that respect are with the general contractor, who is the man who is having the trouble. He does not really come in contact with the labor side of the thing. That is, it is only occasionally with some one architect who may be tremendously interested in that thing, but he might go outside of the straight professional practice and mix in.

Mr. THOMPSON. But is not the architect frequently called in, in connection with the supervision of building work?

Mr. CRANE. I never saw such a case.

Mr. THOMPSON. And has he not the power, under the contract, in case there is a strike on the building, to see what the cause is, and has he not also the authority to try and adjudicate the matter and bring the parties together?

Mr. CRANE. I have never seen a contract in the East, on a big building operation, drawn in that way.

Mr. THOMPSON. Then, in your practice you have not come in contact with these troubles nor have you seen the operation of the trade agreements?

Mr. CRANE. I never have. I realized that I would be a very poor witness for you when I was coming down on the train and read the letter, because I appreciated that I knew very little about the matters.

Mr. THOMPSON. Have you observed these matters? Have you had an opportunity of observing the use and the effect of contracts between bodies of workers and an employer or bodies of employers?

Mr. CRANE. Not enough to be a good witness. I may perhaps have.

Mr. THOMPSON. What experience have you had and what observations have you made?

Mr. CRANE. I, perhaps, have been very fortunate, because I have had a very broad experience in very large building operations and never have had a strike on any of the buildings going on, except in minor contracts.

Mr. THOMPSON. Have you had any contracts with the workmen?

Mr. CRANE. No, sir; I have never had any contracts with the workmen, nor seen them, nor had anything to do with them.

Mr. THOMPSON. Therefore you have never seen them operate, and you do not know how they settled disputes and prevented them, or anything else?

Mr. CRANE. No, sir.

Mr. THOMPSON. I doubt if it would be possible to find another architect that could say as much.

Mr. CRANE. Although I have lived in Philadelphia, my work has been very little in Philadelphia. It has been all over the country.

Commissioner DELANO. It does seem to me, although Mr. Crane seems to have had a very fortunate experience, that he could help us a little more than he is willing to say. He is perhaps too modest; but he certainly has had opportunities to observe many of these things.

Perhaps your freedom from strikes has been due to the fact that you have dealt with certain contractors who are freer from labor troubles than other contractors. Have you avoided contractors who are notorious in any way for getting in trouble?

Mr. CRANE. I think, perhaps, that my freedom from that sort of thing is owing to the fact that my firm have done a great deal of public work that has been rather freer from strikes than commercial work would be. It has just happened that way. My work has been scattered over the country and has been of a public character.

Commissioner DELANO. That is, neither contractor nor union would be very likely to have any trouble with any of Uncle Sam's work?

Mr. CRANE. No; not one of their buildings, for instance.

Commissioner DELANO. You say your work has not been confined to Philadelphia?

Mr. CRANE. No, sir; it has been scattered all over the country, pretty widely.

Commissioner DELANO. Is Philadelphia pretty free from building strikes?

Mr. CRANE. If you ask me that question, I would say there have not been any strikes which have come to my attention, of any importance, for several years. Of course, there must be strikes going on there, but they must be of minor importance as far as tying things up is concerned.

Commissioner DELANO. Then, you have not had much trouble with jurisdictional strikes there, which are so injurious in other cities?

Mr. CRANE. No. I know there was some question about the carpenters there a comparatively short time ago, but it was not a matter that came before me in any way.

Commissioner BALLARD. Has it come to your attention at all that those contractors who have had contracts with their laborers along the lines that have been outlined have had less trouble than others? Would that come to your attention?

Mr. CRANE. That would hardly have come to my attention. That would have been just the one particular building on which they were working at the time.

Commissioner HARRIMAN. We thank you very much for coming, Mr. Crane. Is there any one else to be heard?

Mr. THOMPSON. No. Mr. Alpine and Mr. Dobson could not be here.

(At 5.30 o'clock p. m. an adjournment was taken.)

WASHINGTON, D. C., *Thursday, April 9, 1914.*

The commission met at 10 o'clock a. m., in the assembly room of the Shoreham Hotel.

Present: Commissioners John R. Commons (acting chairman), Mrs. J. Borden Harriman, Frederic A. Delano, Harris Weinstock, S. Thruston Ballard, John B. Lennon, and James O'Connell.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. B. M. Manly, superintendent Division of Industrial Investigations; and Mr. F. H. Bird, superintendent Division of Public Agencies.

TESTIMONY OF MR. CHARLES FRANCIS.

Mr. BARNETT. Mr. Francis, please state your name and address.

Mr. FRANCIS. Charles Francis, Nyack, N. Y.

Mr. BARNETT. What is your official position with the Printers' League of America?

Mr. FRANCIS. I am president of the national, and also of the New York local.

Mr. BARNETT. Will you tell the commission when the Printers' League of America was organized, and what are its purposes?

Mr. FRANCIS. It was organized in November, 1906.

Mr. BARNETT. What are the purposes of the league?

Mr. FRANCIS. There are only two or three paragraphs, which will best explain its purposes. The purposes of this league is to abolish—in the printing and allied trades—the system of making individual labor contracts and to introduce the more equitable system of forming collective labor contracts.

The special object: It is also the object of this league to establish, in conjunction with the representatives of the employees' unions, the necessary organ for collective negotiations, and to defend the common interests of the employers, members thereof.

Furthermore, to do what is possible to establish local and national trade courts for the adjustment of all points of dispute under existing contracts; to prevent, by mutual consultation and conciliation, all strikes and strife between the employer and the employee, and, as a means thereof, to use the methods embodied in sections 1 and 2, and to make agreements, or, if impossible to harmonize any matter, it shall be arbitrated by an expert or experts in the business who is not—or are not at the time—interested, the decision of such arbitrator or arbitrators to be binding on all the parties thereto. To formulate or put into action a council on adjustment and redress for the equitable and intelligent settling of all grievances of whatsoever nature arising between the employers and the employees, or between the employers only who are members of the Printers' League of America; such council to be known as a trade court or as a court of honor; the manner of formation to be determined by the local branch affected, at a regular or special meeting, which will appoint a committee to confer with the employees, unions, who are parties to any agreement made, their acts to be sanctioned by their respective organizations to which the committees belong, and to be binding upon such organization.

Mr. BARNETT. State briefly about what you regard as the fundamental and peculiar principles of the printers' league, as distinguished from other similar organizations of the printing-trade employers.

Mr. FRANCIS. The fundamental principle of the Printers' League is that your employees are much better to work with you than for you. In other words, it is a question of friendly relations between the employer and the employee; and to accomplish that we go down into the unions' rooms and consult and talk with them in making our contracts. I will make allusion to one special contract with what they call the Big Six in New York. We got together with their officers and formulated a contract. After that contract was formulated we asked for an open meeting with their union to put that contract into force. When they met to confirm that contract there were between 1,500 and 2,000 members of the union in the hall and 7 of us employers on the platform. Naturally, there were some very strong speeches made against that contract, but with the counteracting influence of the employers on the platform, the contract was finally carried by unanimous consent, not a single vote dissenting.

Mr. BARNETT. How many branches of the Printers' League of America are there at the present time?

Mr. FRANCIS. There are two in New York—a Jewish and an English; and, then, Cincinnati, Toledo, Cleveland, Chicago, St. Louis, and Spokane.

Mr. BARNETT. What percentage of the employing printers in the job trade in New York are in the league?

Mr. FRANCIS. That is pretty hard to state—except you mean in regard to equipment?

Mr. BARNETT. Yes; I mean in regard to the number of men employed in the book-and-job branch. What part of the men employed in the book-and-job branch does that include?

Mr. FRANCIS. We have something over 10,000 men in the shops that are in the league.

Mr. BARNETT. How many men are employed in the book-and-job trade in New York?

Mr. FRANCIS. I should say nearly twice that number.

Mr. BARNETT. So that half the employing printers in New York City—that is, those employing half the men—are members of the league?

Mr. FRANCIS. Employing half the number of men in New York; yes.

Mr. BARNETT. Are you equally strong in the other cities in which you have branches?

Mr. FRANCIS. Yes; in those cities where they are organized.

Mr. BARNETT. Where you have branches?

Mr. FRANCIS. Yes.

Mr. BARNETT. Roughly, in the cities where you are organized, you have about half of the employing printers, estimating according to the number of men employed?

Mr. FRANCIS. In Chicago more.

Mr. BARNETT. In Chicago more than that?

Mr. FRANCIS. Yes.

Mr. BARNETT. What is the character of the local agreements which your organization makes with the local unions of the printing trade?

Mr. FRANCIS. I have them here.

Mr. BARNETT. I mean, will you give us the salient features?

Mr. FRANCIS. The salient features are that we formulate a contract with them for the purpose of consultation and conciliation and final arbitration of any question that may come up—any kind of difference.

Mr. BARNETT. You have a contract in New York with Big Six?

Mr. FRANCIS. Yes.

Mr. BARNETT. Does that contract exclude from the scope of arbitration the laws of the International Typographical Union?

Mr. FRANCIS. Yes; in so far as the local contract is concerned.

Mr. BARNETT. So that any rule regulating working conditions enacted by the convention of the International Typographical Union becomes automatically binding on your members so far as they employ printers?

Mr. FRANCIS. Yes.

Mr. BARNETT. Is that included in your contract with the pressmen?

Mr. FRANCIS. It is not.

Mr. BARNETT. What is your arrangement in the contracts with the pressmen for the settlement of rules relating to working conditions?

Mr. FRANCIS. The national organization can take up such matters in the same manner as it does with the local.

Mr. BARNETT. You heard Mr. Lynch's testimony yesterday?

Mr. FRANCIS. Yes.

Mr. BARNETT. You heard Mr. Lynch testify that in his opinion it was better for the working conditions in the shop, outside of hours and wages, to be settled by the international union concerned and not by conference with the employers. He thought that the unions are ordinarily fair in these matters and that that was the better method of arranging. Do you agree with Mr. Lynch in that opinion?

Mr. FRANCIS. I agree with him in the fact that he believes that they are ordinarily fair, and I should say they are, but I do not agree with him in the fact that there should be no consultation with the employers.

Mr. BARNETT. Do the members of your league have any complaint to make against any of the laws or rules of the International Typographical Union now in force in their shops?

Mr. FRANCIS. Yes; on some matters they do.

Mr. BARNETT. What matters?

Mr. FRANCIS. I should have to go into a great deal of discussion on that proposition.

Mr. BARNETT. Does the priority law affect the book and job shops?

Mr. FRANCIS. Not at all.

Mr. BARNETT. And the exchange of matrices does not affect them?

Mr. FRANCIS. Very little.

Mr. BARNETT. Does the rule relating to the discharge of men affect the book and job shops?

Mr. FRANCIS. It is very much overlooked. It is not carried out to any material extent at all.

Mr. BARNETT. So that at the present time these rules of the International Typographical Union are chiefly rules intended for newspaper offices, are they?

Mr. FRANCIS. That is so.

Mr. BARNETT. So that the fact that they insist on compliance with those rules without conference does not really militate very much against your making agreements with them?

Mr. FRANCIS. Not at all.

Mr. BARNETT. But you can conceive that it might at some future time be a matter of controversy?

Mr. FRANCIS. Yes; it might at some future time.

Mr. BARNETT. So that on the whole you would feel that the better method was the method which you have adopted in your agreement with the pressmen?

Mr. FRANCIS. Decidedly so.

Mr. BARNETT. You have also, in addition to those local contracts, an agreement with the pressmen's international union, have you not?

Mr. FRANCIS. Yes.

Mr. BARNETT. Will you describe the salient features of that agreement?

Mr. FRANCIS. It is exactly the same as the objects which I spoke of in regard to the league. It is the settlement of all questions by consultation, conciliation, and final arbitration.

Mr. BARNETT. How is this specifically done? Suppose there is a dispute in an office of a member of the Printers' League. How is that dispute arranged? What is the first step under your agreement with the international pressmen?

Mr. FRANCIS. I think I should like to go into a little explanation of that proposition, because it will give some information on the whole proposition.

In the first place, in our contract the business agent, who has been a thorn in the side of the employer for a good many years, is not allowed to go into any of the offices without permission of the employer. That is an agreement. When he does get in by permission and he finds something wrong in the office—of course he has the chairman of the chaple there to take care of the union side exclusive of the business agent—when he gets in there and finds something wrong his proceeding is to go down to the union rooms and write to the executive committee of the local printers' league making his complaint. The executive committee immediately takes it up, and if they decide in favor of the employers and he still thinks he has a grievance it is then referred to the conference committee, the conference committee consisting of three employers and three employees. That provides for an arbitrator should it be necessary.

We have been in existence in New York for eight years with four unions, and in the whole of that time we have only found it necessary to go to arbitration twice. A full account of one of these arbitrations is right here.

Mr. BARNETT. I suggest that you file one with the reporter.

Mr. FRANCIS. Very well.

(A report of the arbitration was filed with the official reporter.)

Mr. BARNETT. Is there any provision for national arbitration?

Mr. FRANCIS. Yes; but so far it has not been necessary.

Mr. BARNETT. The provision is in case the two sides are not able, I presume, to select a local arbitrator, then to go to the national arbitrator?

Mr. FRANCIS. In exactly the same way.

Mr. BARNETT. Would either side have the right to appeal to the national board of arbitration if it was dissatisfied with the findings of the local arbitrator?

Mr. FRANCIS. Yes.

Mr. BARNETT. You have had two arbitrations in New York?

Mr. FRANCIS. Two local arbitrations in New York.

Mr. BARNETT. Did either side appeal?

Mr. FRANCIS. No; not at all. They were both well satisfied with the decisions.

Mr. BARNETT. What kind of persons do you get to serve as arbitrators?

Mr. FRANCIS. I think that is the secret of the success of the arbitration. We aim to have somebody who is acquainted with the conditions in the busi-

ness; in other words, some one who is practical in the business. This is the first arbitration. We did so with the cylinder-press feeders of New York. The man unanimously chosen was president of No. 6, compositors' union, Mr. Murphy. His decision was eminently satisfactory. If you desire, I will describe the contest.

Mr. BARNETT. Yes; I wish you would.

Mr. FRANCIS. The contest was as to whether one man or two men should run the feeding machines on two cylinder presses. The union claimed that there should be one man to each press. We claimed it was not necessary to have more than one man to two presses. The decision was that while one man could run two presses he should be entitled to a little more pay for running two presses than for running one, so that it was decided that while he was running a single press that he should get \$16 a week, and where he was running two he should get \$18 a week. That decision was eminently satisfactory to both sides.

I will just state, incidentally, that one gentleman who was on the outside, not in the agreement, tried to enforce the decision of our arbitrator in his own office. He had some 32 cylinder presses, which made a difference of 16 men to him. The union would not allow him to do that. They said their rules were one man to a cylinder press. He very soon became a members of the Printers' League of America and saved \$10,000 a year.

Mr. BARNETT. Do pressmen continue in New York to enforce their rule on outside printers?

Mr. FRANCIS. Yes.

Mr. BARNETT. That is a different rule from that enforced with the Printers' League?

Mr. FRANCIS. Yes. They claim they go to an arbitration with the league as an individual contract with the league; that is, it does not apply to anybody who is not a member of the league.

Mr. BARNETT. Who was the arbitrator in the other case?

Mr. FRANCIS. He was a former employer, Mr. Willett.

Mr. BARNETT. What was the case? That is, with what trade was it?

Mr. FRANCIS. It was with the same people.

Mr. BARNETT. With the pressmen?

Mr. FRANCIS. This was the arbitration which I have filed. It gives the whole question. That was eminently satisfactory—so much so that when the arbitration was through, and before the arbitrator gave his word, the president of the union, who was one of their committee, came to me and said, "Mr. Francis, I would not go back to the old plan for anything; you could not get me to go back." He said, "This is so much superior that we would not think of going back."

Mr. BARNETT. So that you do not feel the same objection to the employment of arbitrators which some of the witnesses yesterday expressed?

Mr. FRANCIS. Not at all. Some time ago Bishop Potter was employed in that position, with the printers, and made what to him, no doubt, was a good decision, and it was accepted, but it had to be corrected, because he did not know the technicalities of the business. They had to get together afterwards and correct his decision. In our case we always try to get somebody who knows the conditions, and who will not make technical mistakes of that kind.

Mr. BARNETT. Have you been equally well pleased with the workings of the agreement in other cities outside of New York; the other places where you have branches of the league?

Mr. FRANCIS. Yes. But it is not to be supposed that this is perfection, by any manner of means. We strike difficulties in this, as well as in anything else. For instance, the principal difficulties with such a matter as this are the unions themselves.

Take, for instance, the internal difficulties in the unions. Take, for instance, the politics in the unions. That has a great deal to do with the arbitration difficulties which we have. When they are coming near to an election, it is difficult to get anything through, or, if it does go through, it must be favorable to the union, in order to help a reelection.

Then they have jurisdictional fights between themselves, with which we ought to have nothing whatever to do. Those also have some effect on the employer, incidentally. For instance, the pressmen claim jurisdiction over certain apprentices, and the press feeders authority under the same international jurisdiction, but not under the same local jurisdiction, claiming equal

jurisdiction over some particular position. In those instances we generally suffer.

Mr. BARNETT. And sometimes have a strike?

Mr. FRANCIS. No; the only thing approaching a strike since the Printers' League has been in existence in New York City has been two instances in which the men really got drunk and went off, and their places were supplied within two hours' time after they went out, by the union.

Mr. BARNETT. So that you have no complaint to make on the score that the agreement has been violated through strikes?

Mr. FRANCIS. No.

Mr. BARNETT. Or cessation of work?

Mr. FRANCIS. Not at all.

Mr. BARNETT. The agreement provides that there shall be no cessation of work?

Mr. FRANCIS. It provides that there shall be no cessation of work, pending the decision—that matters shall remain in status quo.

Mr. BARNETT. Have any cases been taken up from the other cities under the pressmen's agreement, to the international board of arbitration?

Mr. FRANCIS. None of them.

Mr. BARNETT. Has the national board ever been convened?

Mr. FRANCIS. No.

Mr. BARNETT. Have you attempted to get any agreement with the International Typographical Union similar to the pressmen's union?

Mr. FRANCIS. Yes.

Mr. BARNETT. Why were you not able to make that agreement?

Mr. FRANCIS. It was at the convention, I think, in Minneapolis four years ago, but for some reason Mr. Lynch did not see fit to put it through at that time. It was put up to him and his executive committee. For some reason he has put off the question, up to the present time. We expect to have that go through this year.

Mr. BARNETT. Do you expect to have him allow claims to go to adjudication and settlement in all matters?

Mr. FRANCIS. That is what we expect to get through?

Mr. BARNETT. You expect then to get the International Typographical Union to waive this rule on which they insist in other relations with the publishers?

Mr. FRANCIS. That is really the intimation you got yesterday from Mr. Berry here, when he said they made some difference on account of the broad principles of the Printers' League.

Mr. BARNETT. You hope the International Typographical Union will make a similar agreement?

Mr. FRANCIS. Yes.

Mr. BARNETT. Has that been the chief difficulty in getting through this arrangement, as you understand it—the reluctance of the union?

Mr. FRANCIS. No; I think the chief difficulty came from the fact of the explanation which Mr. Lynch gave you yesterday about the difficulty of the odd man. He wanted to get that settled with the American Newspaper Association before he began negotiations with us. I think that has been the principal cause of the delay.

Mr. BARNETT. I think that is all, Mr. Chairman.

Commissioner DELANO. Mr. Francis, I understood you to say that your league deals with four different classes or subtrades of the general printing trade?

Mr. FRANCIS. Yes.

Commissioner DELANO. How many other subtrades are there in the general trade with which you do not deal?

Mr. FRANCIS. We have no contract with the engravers.

Commissioner DELANO. That is the only one?

Mr. FRANCIS. There is the contract with the electrotypers, but not connected with the league. It is a league contract, but it is not connected with our league.

Commissioner DELANO. Unfortunately I did not hear all of the testimony yesterday, but there has been a good deal of testimony before the commission for and against this proposition of an odd man. That is what we call the umpire or referee. Some take the position that having a referee in the background tends to result in harmony between the two sides of the faction, because those two sides realize that the referee will come in if they do not settle it.

Others take just the reverse position, that having a referee in the background has the effect of postponing harmony, because they feel that the matter can be referred to a referee, and he will be made the "goat," as was the expression used.

I would like to have an explanation from you as to how you think that works; which view of the thing is correct.

Mr. FRANCIS. In a sense I think they are both correct, but I think that the mistake comes in not having the right man as the referee.

Commissioner DELANO. How do you secure the right man? Do you secure him in advance of trouble; do you name him at the beginning of the year, for instance, not knowing just what is coming up, or do you wait until you get an acute situation and select the referee?

Mr. FRANCIS. We wait until we find that we can not agree by conciliation.

Commissioner DELANO. Supposing one side insists on one man or group of men, and the other side will not accept that man or group of men, but insists on an entirely different group of men; do you have a deadlock on that question?

Mr. FRANCIS. We have not deadlocked so far. We have been unanimous in our selection.

Commissioner DELANO. Unanimous?

Mr. FRANCIS. And in one case you will notice it was a union man, and in the other case an employer.

Commissioner DELANO. Is there any rule for the selection? Does one side or the other agree that it will select some one of a number of men that have been chosen or named by the other side?

Mr. FRANCIS. Both sides put up names, until we can agree by a process of elimination to decide upon some one man.

Commissioner DELANO. Do you find that when a man has once decided against either side, he is ever acceptable again as an umpire or referee?

Mr. FRANCIS. We have not had such a decision.

Commissioner DELANO. They were compromises, were they not?

Mr. FRANCIS. Yes.

Commissioner DELANO. Satisfactory to both sides?

Mr. FRANCIS. Yes.

Commissioner DELANO. Usually compromises are unsatisfactory to both sides.

Mr. FRANCIS. In these two cases they were perfectly satisfactory to both sides.

Commissioner DELANO. That is all, Mr. Chairman.

Commissioner BALLARD. Mr. Francis, is there any agreement on the part of the employers or employees that either side will not work men in any other association who are not members of either of those two associations? Can the union men work for anybody who is not a member of either association?

Mr. FRANCIS. Oh, yes.

Commissioner BALLARD. Can your association employ anybody it pleases, or must it employ union men?

Mr. FRANCIS. They agree to employ union men.

Commissioner BALLARD. Will union men who work for the association handle nonunion material?

Mr. FRANCIS. Just let me finish my answer. We agree to employ union men, but the union must provide us with men who are proficient in the business.

Commissioner BALLARD. Will they handle nonunion material?

Mr. FRANCIS. Yes.

Commissioner WEINSTOCK. Were you here yesterday, Mr. Francis, when Mr. Frey, of the Molders' Union, testified?

Mr. FRANCIS. Yes.

Commissioner WEINSTOCK. You remember the attitude he took toward arbitration?

Mr. FRANCIS. Yes.

Commissioner WEINSTOCK. He thought it was not conducive to the best results, and that the wisest plan was to endeavor to adjust difficulties through conciliation, and that if conciliation failed, he regarded a strike as a lesser evil than arbitration. Are you in accord with that view?

Mr. FRANCIS. I am entirely against it. I am absolutely opposed to strikes and lockouts.

Commissioner WEINSTOCK. You think if arbitration is an evil, it is a lesser evil than strikes or lockouts?

Mr. FRANCIS. Decidedly.

Commissioner WEINSTOCK. As an employer, would you, if you could, abolish the unions?

Mr. FRANCIS. No.

Commissioner WEINSTOCK. Why not? Would it not give you more latitude? Would you not be freer? With unions in the field, are you not more or less straight-jacketed?

Mr. FRANCIS. A gentleman once said to me, who was running along the same vein as your question, when there was a strike on in New York, "You ought to be very well satisfied." He said, "You only have one union to deal with, whereas I have a union in every man that is in the shop."

Commissioner WEINSTOCK. Is it not easier to handle the one man, if he is a union unto himself, than it is to handle a multitude of men, if they are united?

Mr. FRANCIS. I think not. The principle of the whole proposition is the question of humanity, the question of making these men understand that you are doing the very best you can for them honestly and that you expect them to do the best they can by you. In other words, as they put it, they want a square deal. If they want a square deal, and we are willing to give it to them, then they should give the employer a square deal also. It is a question that works both ways.

Commissioner WEINSTOCK. Then as a result of your experience you believe that from the standpoint of the worker and the standpoint of the employer, collective bargaining is conducive to the best results?

Mr. FRANCIS. I do.

Commissioner WEINSTOCK. Rather than individual bargaining?

Mr. FRANCIS. I do.

Commissioner WEINSTOCK. Have your unions—that is, the unions with which you deal—always observed their contracts?

Mr. FRANCIS. Yes.

Commissioner WEINSTOCK. There have been no instances of contract breaking?

Mr. FRANCIS. We have had no instance of contract breaking.

Commissioner WEINSTOCK. You have already explained that the conditions under which you operate in New York are different from those in Boston, where the employers have an agreement that they are at liberty to employ nonunion as well as union men. In your case you are confined to union men?

Mr. FRANCIS. As long as the union can supply us with proper material.

Commissioner WEINSTOCK. What are the relations existing between the employers, your association, and the unions? Are they cordial and friendly, or are they hostile?

Mr. FRANCIS. Decidedly friendly. I would say personally, for myself, that I have been down to the union rooms about a hundred times, and that I have always been received with the greatest cordiality, and I have been listened to with respect, and in many instances have gained not only confidence and esteem, but the points I went to gain.

I would like to mention one matter that related to me personally, not as a member of the league, or as anything except an employer of labor. I went down to the Cylinder Press Feeders' Union on one occasion where they had made an application for a raise in wages, with the intention of asking them to withdraw their application voluntarily. I made my plea, and after I got through I learned that I lost that proposition by a majority of three, which shows that the employer has some influence upon that kind of a proposition, because from what I knew when I went into the room, there was not a man there who was in favor of withdrawing that application for a raise.

I honestly believe that if I had had two or three other employers who would have backed up that plea to them we would have won out—that would have determined it. I showed them in what condition it would leave them; it would put them in a position that when they came back, showing a consideration for the employer, it would be very hard for the employer to refuse them, if they came back in a proper time. I will say that they respond wonderfully to a talk of that kind. If you will tell them the conditions that you have and they have confidence in what you are telling them, they respond very readily. I think that the system of education by getting closer together with the employees would have a wonderful effect on the whole Nation in regard to its relations between employer and employee.

Commissioner WEINSTOCK. I take it, then, that you have found it, as the result of your experience, that far better results, from the selfish standpoint of the employer, are to be obtained by working with the unions rather than fighting the unions?

Mr. FRANCIS. Decidedly so. I do not think there is any comparison.

Commissioner WEINSTOCK. That if you show a readiness to recognize and deal with them they are likely to be in a more reasonable frame of mind than if you show hostility and lead them to feel that you want to wipe them out?

Mr. FRANCIS. Decidedly so.

Commissioner WEINSTOCK. Have you had any difficulty about the problem of limited output?

Mr. FRANCIS. Never.

Commissioner WEINSTOCK. Is there any restriction placed upon your men as to output?

Mr. FRANCIS. Not that I know of; and I really believe that it is not true, so far as we are concerned.

Commissioner WEINSTOCK. I am a layman in the printing business, and so I am not familiar with the technicalities; but are your people paid by piecework or by day wage?

Mr. FRANCIS. Almost entirely by day wage at the present time. Piecework is almost abolished.

Commissioner WEINSTOCK. Have you any means of measuring a man's work, as to whether he is earning his wage or not?

Mr. FRANCIS. Yes; in a sense we have, especially in the pressrooms.

Commissioner WEINSTOCK. And you can easily distinguish the fit from the unfit by results?

Mr. FRANCIS. In my place I have a report from each press three times a day, so that I know pretty nearly what is being accomplished on that press; and, naturally, the employee is the one to look to for results.

Commissioner WEINSTOCK. Do your union men show loyalty to their employers?

Mr. FRANCIS. Yes.

Commissioner WEINSTOCK. They give the employer the best they have to give?

Mr. FRANCIS. Yes.

Commissioner WEINSTOCK. Can you discharge any of your men at will, for any cause?

Mr. FRANCIS. I should say yes.

Commissioner WEINSTOCK. Are you obliged to give a reason for the discharge?

Mr. FRANCIS. If the man complains to the union, yes.

Commissioner WEINSTOCK. If, in the judgment of the union, it has not been a fair discharge—that is, if there has not been any cause that in their judgment would be sufficient to warrant his discharge—can they demand a reinstatement of the man?

Mr. FRANCIS. It goes through the usual process of conciliation. The complaint goes to the executive committee and then to the conference committee.

Commissioner WEINSTOCK. If it is a question of competency, do you have to prove that the man is incompetent?

Mr. FRANCIS. Not necessarily.

Commissioner WEINSTOCK. Is it not rather a difficult thing to do, to prove a man's incompetency?

Mr. FRANCIS. Yes; it is a difficult thing.

Commissioner WEINSTOCK. So that if, in your judgment, the man is incompetent, that practically ends it, does it not?

Mr. FRANCIS. Yes.

Commissioner WEINSTOCK. Will the union intervene in his behalf if he has been dismissed for intoxication?

Mr. FRANCIS. Sometimes they will, but they never get him reinstated.

Commissioner WEINSTOCK. They never do, but they are willing to intervene in his behalf?

Mr. FRANCIS. If it is a question whether or not he is intoxicated.

Commissioner O'CONNELL. The question, sometimes, as to when a man is intoxicated, has not been legally decided.

Commissioner FRANCIS. We have never had any trouble on that score. I think if the foreman were to say that the man was intoxicated, his word would be taken for it.

Commissioner O'CONNELL. We had quite a serious question in the District here, under our new law, as to when a man is intoxicated.

Commissioner WEINSTOCK. Yes; I suppose that is a difficult thing to determine, at times. I remember hearing of a case in California where a man was charged with crime, and the defense being that he was under the influence of liquor, a brewer being called as an expert, the question was put to him, how many glasses of beer a man could drink without getting drunk, and he said

that he drank 25 or 30, but some men made hogs of themselves and drank 35 or 40.

On the whole, Mr. Francis, then, you feel that the relations between your association and the unions are satisfactory and harmonious, and you would not change the conditions if you could?

Mr. FRANCIS. There are some things we would like to change.

Commissioner WEINSTOCK. But, taking the situation as a whole—

Mr. FRANCIS. Taking the situation as a whole, it is a hundred per cent better than it was before the institution of the league.

Commissioner WEINSTOCK. That is all, Mr. Chairman.

Commissioner O'CONNELL. Mr. Francis, are the members of the league also members of the typhotetæ?

Mr. FRANCIS. In some instances. I am a member of the typhotetæ.

Commissioner O'CONNELL. And vice versa?

Mr. FRANCIS. And vice versa.

Commissioner O'CONNELL. What is the essential difference between the league and the typhotetæ?

Mr. FRANCIS. The typhotetæ is an organization ostensibly for the building up of the printing business from the business standpoint. Originally it was formed for the purpose of fighting the unions. After the strike of 1906 it lost its occupation. In other words, it was beaten out.

Commissioner O'CONNELL. The typhotetæ was beaten out?

Mr. FRANCIS. The typhotetæ was beaten out, and from that time forward it has gone into the cost system, introducing cost systems into the different offices for the purpose of teaching the employer how to get a profit out of his business. They have a union and a nonunion branch. They have not formulated their union branch at all, but they have formulated their nonunion branch, and that is in existence at the present time. I should say that the Printers' League and the typhotetæ are endeavoring to get together, so as to make the Printers' League practically the union branch of the typhotetæ, if we can do so without losing members, and without interfering with the working of the league proposition; for the reason that the typhotetæ has been in existence for a very much longer time and has a wider scope and a larger membership. We have done no organizing, and what has been accomplished by the league has just been merely the natural growth from city to city.

I have been invited to different cities at different times, and have explained the purpose of the league; and the result has been that the league has been formed; but there has been no general effort. I could not give the time to it, because I have business to attend to. I have 300 employees in my office.

Commissioner O'CONNELL. In the formation of these two sections of the typhotetæ, one portion is organized with a view to cooperating with the unions, and the other is anti?

Mr. FRANCIS. Yes.

Commissioner O'CONNELL. When a member joins is he permitted to join either one of these divisions of the typhotetæ, or to become a full member?

Mr. FRANCIS. When they formulate those divisions. While the constitution provides for the formulation of a union committee, there has been no union committee formed up to the present time. There was a change made in the constitution in Denver, I think it was three years ago. Prior to that there was no regulation at all on the question of labor. At that time they took up this union and nonunion question and changed their constitution so as to allow their members to form an independent organization of nonunion and union branches.

Commissioner O'CONNELL. In the organization itself there is within it a smaller organization composed of those who do not wish to contract with unions.

Mr. FRANCIS. That is the main organization. These others would be outside of that main organization.

Commissioner O'CONNELL. But all holding membership in the original or parent organization?

Mr. FRANCIS. Yes.

Commissioner LENNON. I should like to ask, Mr. Francis, whether or not in so far as labor has to do with profits, your experience is that friendly relations with the union have been beneficial to you as a business man?

Mr. FRANCIS. Yes; especially on the question of stability. We have no fear at all of any strike, and in the business in which I am engaged, which is very largely publications, that is a very necessary proposition.

Commissioner LENNON. Then from your experience you consider it a profitable proposition financially.

Mr. FRANCIS. I certainly do.

Commissioner LENNON. That is all.

The ACTING CHAIRMAN. Mr. Francis, I may have missed your answer to this question: Your business is practically entirely distinct from that of the newspaper publishers; that is to say, you are what would be called a book and job office?

Mr. FRANCIS. A commercial office; yes.

The ACTING CHAIRMAN. You call that a commercial office?

Mr. FRANCIS. Yes.

The ACTING CHAIRMAN. What does that include that would not be included under the term of "book and job"?

Mr. FRANCIS. A book and job office generally refers to what you might term a commercial office, and yet at the same time it does not really cover the whole question. There are so many different divisions in the printing business at the present time that the word "commercial" covers the ground a great deal better than "book and job."

The ACTING CHAIRMAN. What besides book and job would be an illustration of what it means?

Mr. FRANCIS. A label office would come in under the head of "job." At the same time it would be strictly a label office, printing labels, like drug labels, for instance. That is one branch of the business. A poster office, printing nothing but posters, would be another. It is divided up into a great many things at the present time. Take the stationery business. That is a very large majority, and it comes under the head of job, but it differs, and I think the word commercial covers it a little better. Then take my own office. Sixty per cent of my business is publications.

The ACTING CHAIRMAN. That is, weeklies and monthlies?

Mr. FRANCIS. Weeklies and monthlies.

The ACTING CHAIRMAN. Then you have in your office a necessity of getting out your work on time?

Mr. FRANCIS. Yes. I put out a publication every day; different publications, monthlies and weeklies, etc.

The ACTING CHAIRMAN. Do you find that in bidding for work you are at a disadvantage with typothetæ or nonunion commercial houses—commercial printers?

Mr. FRANCIS. I do not. I find the competition is a great deal stronger from outside places, such as Mr. Finlay mentioned yesterday, where the rate of wage is so much smaller than it is in New York City. New York City pays the highest rate of wage of any city in the country.

The ACTING CHAIRMAN. Would it make any difference whether those outside cities were controlled by the union or were open shop?

Mr. FRANCIS. It does not make any difference. The rate of wages there is smaller, and the consequence is the expenses are less.

The ACTING CHAIRMAN. So the union does not protect you against the competition of smaller localities?

Mr. FRANCIS. Outside?

The ACTING CHAIRMAN. Outside localities.

Mr. FRANCIS. It does not. It has tried to in some instances.

The ACTING CHAIRMAN. Have you asked them to do it in any way?

Mr. FRANCIS. Yes. In the law printing they made a strenuous effort in New York to counteract the effect of Middletown, N. Y., which was taking a large amount of the work out of New York.

The ACTING CHAIRMAN. Could you state the difference between the wages you pay and the wages paid at Middletown in law printing?

Mr. FRANCIS. Middletown was run on a nonunion proposition and the wages would be nearly cut in half as compared with New York City.

The ACTING CHAIRMAN. About half the wages are paid in Middletown?

Mr. FRANCIS. Yes; mostly girls on that work. Law work is straight work, and it is comparatively easy.

The ACTING CHAIRMAN. Take any other outside town that does law printing under union conditions, can you recall such a case?

Mr. FRANCIS. I do not know of any case, specially. You might take it in another line, the book-printing line. The Riverside Press takes a great deal of work out of New York.

The ACTING CHAIRMAN. Where is that located?

Mr. FRANCIS. Just outside of Boston, at Cambridge, I think.

The ACTING CHAIRMAN. Is that a nonunion shop?

Mr. FRANCIS. No; it is a union shop; but their conditions make their overhead charges and their wages very much less than ours.

The ACTING CHAIRMAN. The union, then, is not protecting either Boston or New York against book printing by firms outside?

Mr. FRANCIS. No.

The ACTING CHAIRMAN. Would it be possible for them to do it?

Mr. FRANCIS. I think it would be a very difficult thing to accomplish. It would be the expense of living in one place, and the expense of living in the other, and the amount of time necessary to go to and from work, which makes it very hard to regulate.

The ACTING CHAIRMAN. There is no advantage in having a printers' league in one of these outside towns that pays lower wages, is there?

Mr. FRANCIS. Oh, yes; there would be an advantage in the Printers' League there, because they would protect themselves against trouble with the union.

The ACTING CHAIRMAN. But they would also desire to protect themselves against the competition of you.

Mr. FRANCIS. We do not compete very much with the outside, although that was spoken of yesterday; that is, that they go out and get it. In some cases we do, because of the very much more complicated machinery that we can use in New York City that they can not use in the smaller towns.

The ACTING CHAIRMAN. That is, you can get large operations?

Mr. FRANCIS. Large operations. They have not the facilities to get away with some things that we have.

The ACTING CHAIRMAN. On another point, do you know of any case in which, under your agreement, you have actually employed a nonunion man because the union was not in a position to furnish you with a man who could do the work?

Mr. FRANCIS. I do not recall any such case at the present time.

The ACTING CHAIRMAN. Whether in your experience or any other?

Mr. FRANCIS. The only one that I remember on that was not one that we had any contract with. That was a machinist. There were two machinist unions, and I hired a brotherhood man, and he remained in my place until I wanted to get rid of him, although they made some objections just the same.

The ACTING CHAIRMAN. He was not under the jurisdiction of the printers then?

Mr. FRANCIS. No; not under the jurisdiction of the printers.

The ACTING CHAIRMAN. Then, as a matter of fact, that option of taking non-union men is of no particular value to you?

Mr. FRANCIS. Yes; it is in some respects. I would explain one case. The J. J. Little & Ives Co. needed some monotype operators. The monotype operators had all been confiscated down here to Washington for the time being. They needed them down here and had drawn from New York until New York was absolutely dry. They had to have them at a certain time. Mr. Little was a member of the Printers' League, and sent down to the unions and they did not supply the men, and he put an advertisement in the World stating that he wanted some monotype operators, union or nonunion. I think he had one or two applications, as far as nonunion men were concerned, but the union immediately got busy, and he got all the monotype operators he wanted, and competent ones, too.

The ACTING CHAIRMAN. So, then, according to that, the advantage is that it puts pressure on the union to hunt up the men to furnish?

Mr. FRANCIS. Exactly.

The ACTING CHAIRMAN. Suppose they were to furnish you with a man, not in a different line of work or on a different specialty, but in ordinary composition, that you judged was incompetent.

Mr. FRANCIS. It is up to us as to whether we consider him competent or not.

The ACTING CHAIRMAN. You have never gone outside of the union to get a man in a case like that?

Mr. FRANCIS. No; we have not found it necessary.

The ACTING CHAIRMAN. In the matter of the exclusion of the business agents from the office, on what grounds have you had trouble with the business agents as distinguished from the chairman or father of the chapel?

Mr. FRANCIS. I do not just exactly understand.

The ACTING CHAIRMAN. You said that you had had a great deal of trouble with the business agent; that is, an officer of the union who was not one of your employees?

Mr. FRANCIS. Yes.

The ACTING CHAIRMAN. How is it that you do not have similar trouble with the man representing the union who is your own employee?

Mr. FRANCIS. Why, the difficulty has been that in most instances some employee who has been temporarily employed goes to this business agent and makes some kind of complaint and then he comes up to the office with the intention of getting even in some shape or another, and the consequence is that he comes up in a bad spirit, whereas the chairman of the chapel, if he is any kind of a reasonable man—and they usually are—gets along very well with the firm, and he knows the reasons why that man was put out, or what his trouble is, and he usually sanctions it. But the business agent is sometimes inclined to show a little authority, and he will come down and threaten the office, if there is no Printers' League in the office, that he will take the men out unless they reinstate that man. There is no reason at all; it is just despotic action.

The ACTING CHAIRMAN. So far as your experience goes, then, you think that the rule should provide that the business agent could not go on the job without the consent of the employer?

Mr. FRANCIS. I think it is very much better. I do not see any reason why a man from the outside or from the union should have entrance to your shop, when they are already represented in the office by the chairman of the chapel, and they insist upon having the foreman as on their side, also. That I disagree with, because I think that the foreman ought to represent the office as opposed to the chairman, who represents the union. I do not think there ought to be any outside interference.

The ACTING CHAIRMAN. But the business agents should restrict their dealings to the head of the firm?

Mr. FRANCIS. Yes.

The ACTING CHAIRMAN. And should not be allowed to deal with the men in the office?

Mr. FRANCIS. No.

The ACTING CHAIRMAN. In the case of the discharge of a union man on the ground that he is inefficient, the objection that would be brought up by the union would be that he is to be discharged for union activity, as a rule?

Mr. FRANCIS. Yes; I presume so.

The ACTING CHAIRMAN. Have you had complications arising out of discharging a man, and its being claimed that is was a matter of discrimination rather than a matter of inefficiency?

Mr. FRANCIS. I never heard of such a thing. We have had very little trouble with anything of that kind.

The ACTING CHAIRMAN. When you discharge a man it is usually accepted as a matter of incompetency?

Mr. FRANCIS. Yes.

The ACTING CHAIRMAN. To do your work?

Mr. FRANCIS. Yes.

The ACTING CHAIRMAN. And the union does not bring up that question?

Mr. FRANCIS. The union has not brought up that question at all with the league, that I know of.

Commissioner HARRIMAN. Mr. Francis, I would like to know how you would suggest bringing about a better understanding between the unions and the average employer. How would you bring them into closer touch?

Mr. FRANCIS. Very largely on the humanity principle.

Commissioner HARRIMAN. How would you have them start? Educate them up?

Mr. FRANCIS. I think it would be necessary for the employer to make the employee understand the conditions under which he is working. We have kept too much aloof from the employee, and he has gone into the office with the idea that the employer is just merely manufacturing money from his services, and he gets that idea so closely woven into his mind that he thinks he ought to have some of it, and he is going to get it some way or other. That is the impression that you have got to eliminate from the mind of the employee, and the only way that I know to eliminate it is to associate with them and get their confidence, and when you tell them anything tell them the truth straight, and do not try to hide anything, which has been done by the employers time and again. They have not been making much more and they just simply say that they can not pay these wages, but they do not show the conditions.

What I have said before is true. At any time I have gone down into the union rooms personally, myself, I have been treated with the utmost respect, and I honestly believe that every man in the room had confidence in what I said to him about the matter. What I have told them time and again is this, that it is impossible for them to take out of the employer's pocket any more than they put in. It is absolutely necessary for them to produce, if we are going to have any business at all, and if that business stops it stops them as well as it stops the employer; that they are half partners in any business, because they take away the first half of the money that comes in, and they have to have theirs, whether we have any or not. Forty per cent in addition to that goes to the overhead charges, and there is left only 10 per cent, as a general rule, about which we can have any controversy, and the question comes up, how much of that 10 per cent we are going to quarrel about, and if so, is it worth while; and I think education along those lines, which shows that they are absolutely necessary for the business and should be consulted in a good many cases, would be a very efficient manner in which we could overcome a great many of the difficulties.

I also have put it up to the employees in the printing business that it is their duty, as being the most intelligent class of labor in the United States, or in any other country, to lead the way under those conditions. They can understand.

You know, I can easily understand, in regard to the question of Mr. Schaffner, where he has a number of foreigners, that it is almost impossible to get them to understand the questions that we can make our men understand. You can talk as intelligently to a class of compositors and pressmen and make them understand the conditions of business as well as you can any business man; and if you are straightforward and honest in your convictions and can show them they are ready to be shown, and they are ready to respond to almost anything that you think or can make them see is necessary for the upbuilding of the whole business, because directly they stop work they stop themselves. They have got to keep on producing. I have told them this, that the whole capital of this country would not pay the wages for any length of time if they did not keep on producing. It is absolutely necessary to produce in order to keep the machinery moving, in order to obtain food and clothing for their families, and if they do not do that, or if they try to do anything in an antagonistic mood, it is absolutely impossible to get the best results. In other words, I have told them this, that if there is a man loafing alongside of one who is working, the man who is working is paying that man's wages, indirectly; that he has got to earn enough to pay the man that is loafing, and therefore it is up to him to see that the man does not loaf. The more industry, the more chance of paying wages.

Commissioner HARRIMAN. Do you believe there should be a National or State board of arbitration?

Mr. FRANCIS. I think perhaps it might be a pretty good thing, in a good many instances.

Mr. BERRY. Mr. Chairman.

The ACTING CHAIRMAN. Have you a question that you would like to ask?

Mr. BERRY. I would like to ask one or two questions, if the commission will permit.

The ACTING CHAIRMAN. Very well.

Mr. BERRY. In following up this question of fair play with the union that you speak of, it is a fact that you attend the conventions of the various printing trades unions?

Mr. FRANCIS. Always at their invitation.

Mr. BERRY. And discuss with them matters of law?

Mr. FRANCIS. Yes.

Mr. BERRY. It is a fact, too, that you have suggested a certain change in their fundamental laws, which has been given consideration and changed upon your request?

Mr. FRANCIS. That is true.

Mr. BERRY. In carrying out the general idea of cooperation and better understanding?

Mr. FRANCIS. Decidedly so.

Mr. BERRY. That is the international union that does that. Regarding the matter of uniform competition, it is a fact that the five international printing-trades unions have a universal eight-hour work day wherever they have their organization?

Mr. FRANCIS. Yes; that is true.

Mr. BERRY. But there is a variance as to compensation—as to wages?

Mr. FRANCIS. Yes.

Mr. BERRY. Which is the only difference in New York and the outside States. I want to say right on that point that the International Printing Pressmen's Union is endeavoring to establish, and is on record as favorable to the establishment of, a uniform wage scale throughout North America. I am quite confident that if the printers' league controlled the employing printers of this country, as we control the employees, we could very easily establish a uniform wage scale. I make this statement in order that the commission may understand that our union is desirous of giving to the employer every protection which is a fair protection, in the matter of competition; every protection that it is within our power to give; and one of the chief reasons for the failure to have a uniform wage scale is because of the division of the employers among themselves.

Commissioner WEINSTOCK. I should like to present the same thought that Mrs. Harriman presented, from a little different angle. I should like to ask you what, in your judgment as a successful employer of many years' experience and evidently as a profound student of the labor problem, is the missing link between capital and labor.

Mr. FRANCIS. The missing link is the fact that from time immemorial, since the unions came into existence, we have looked upon one another as enemies; the employer as the natural enemy of the workingman, and the workingman as the natural enemy of the employer, and it is just about time that we changed that proposition. Whether we want to or not, our aims must be the same; otherwise, we can not get the necessary results.

Commissioner WEINSTOCK. Is not the Socialist emphasizing that thought in the mind of the worker, that the capitalist is his natural enemy, and that he can only get rid of him by swallowing him up?

Mr. FRANCIS. I think that is true. Still, it seems to me that it is a very large sentiment, which Mr. Berry spoke of, at the present time. I find they are very willing to listen to an employer if he will go, and they are more than willing to issue invitations.

Since the printers' league came into existence there has never happened one international convention that, as president, I have not been asked to address them and go and consult with them on any item I thought would be beneficial to the general working conditions in the printing business.

Commissioner WEINSTOCK. I gather, then, Mr. Francis, that your judgment is that one way to find the missing link is along the lines of contact. That is, for the employer and the worker to get together more often and to learn to know each other better.

Mr. FRANCIS. I think there is no doubt about that, and I think it is up to an employer to educate the workingman in the principles that are absolutely necessary to success in business. Those principles are along the line of cooperation.

Commissioner WEINSTOCK. Are there many Socialists in the ranks of the printers?

Mr. FRANCIS. We run across them sometimes.

Commissioner WEINSTOCK. Do they dominate?

Mr. FRANCIS. No; not at all.

Commissioner BALLARD. Do you use the union label on your work?

Mr. FRANCIS. Yes.

Commissioner BALLARD. Do you find it has any particular advantage?

Mr. FRANCIS. When I find it is of no advantage I throw it out.

Commissioner BALLARD. Do you find it an advantage?

Mr. FRANCIS. At the present time; yes. I do not use it generally. I only use it when it is requested.

Commissioner BALLARD. For instance, if you should have an accident or breakdown in your shop, and you wanted to pick up some men on the street to make the repairs, would you be compelled to get union carpenters, union machinists, or printers, or could you hire anybody?

Mr. FRANCIS. I have never had any trouble with anything of that kind.

Commissioner BALLARD. Do you mean you could or could not employ a non-union man?

Mr. FRANCIS. I should take the opportunity of repairing that break as quickly as possible, and if I could not get a union man I would take anyone I could get.

Commissioner BALLARD. Would the union printers complain?

Mr. FRANCIS. There might be a complaint come in, but I have never known of any serious complaint coming in.

The ACTING CHAIRMAN. We are very much obliged to you, Mr. Francis.

Mr. FRANCIS. Mr. Chairman, there is just one other thing that I would like to call to the attention of the committee, if I may be permitted, and that is to call attention to the growth of unionism, especially in our own particular line. I would say that on the introduction of the linotype in 1886, especially where it came to the commercial line, the International Typographical Union practically comprised all of the branches of the allied printing trades, and the total number of members at that time was about 20,000. At the present time they have split up into five different organizations, and there are now between 100,000 and 125,000 persons in those unions. That shows that the growth of unionism is greater than the growth of the printing business; in other words, that it is increasing all the time, and that it has come to a time when we have to take care of that matter.

There is another suggestion I should like to make, if I may be allowed, and that is this: There has been some statement made here on our own particular basis about compulsory arbitration. I do not think we are quite ready for that at the present time, but what I do think is this: That there ought to be some law which would be binding on both parties to fulfill the moral contracts into which we enter, for they are nothing more than moral contracts at the present time.

I will say, in respect to these booklets which I have here, I think they might be of some benefit to the commission; and then there is this other book which I have here, which contains the constitution and by-laws of the Printers' League of America. In that there is a speech by the Hon. Joseph J. Little, who was a Member of Congress, and was also president of the board of education of New York City. He recently died. That speech has some very pertinent remarks upon the questions that the Printers' League take up, and I will leave that for the benefit of the commission.

The ACTING CHAIRMAN. What date is the book?

Mr. FRANCIS. 1909. It was at the inception of the National Printers' League.

The ACTING CHAIRMAN. Have you published any annual report since that time?

Mr. FRANCIS. We have not.

The ACTING CHAIRMAN. You could furnish to the commission all of your printed matter?

Mr. FRANCIS. Yes.

The ACTING CHAIRMAN. And all of the statistics which you might have?

Mr. FRANCIS. I can give you the statistics of the rates of wages in the various towns and cities, if that would be of any assistance.

The ACTING CHAIRMAN. If we call on you you will be glad to furnish these statistics?

Mr. FRANCIS. Yes; I will be very much pleased to, because I believe it is necessary that the union end of labor and the employers get together, and I think they have got to get together through cooperation one with the other, and not through strikes or lockouts.

The ACTING CHAIRMAN. That is all. Thank you, Mr. Francis.

GENERAL.

TESTIMONY OF MR. J. E. WILLIAMS.

Mr. THOMPSON. Mr. Williams, I will ask you to give your name and present address and occupation to the reporter.

Mr. WILLIAMS. Mr. J. E. Williams. I am the mediator of labor disputes, chiefly, now. My home address is Streator, Ill. My business address is No. 1314, 200 Fifth Avenue, New York City.

Mr. THOMPSON. I believe you have had some experience in the field of arbitration. Will you state what your experience has been?

Mr. WILLIAMS. It runs back quite a number of years. I was a coal miner myself about 15 years, and was interested in labor matters. I graduated from that business into the newspaper business, and into the amusement and insurance fields. I kept up my interest in the labor matters. I have been called upon as mediator and arbitrator at different times. Recently I prefer to call myself a mediator. I find that to be a fitter title for the kind of work that I

do. In Chicago I am chairman of a board of arbitration. In New York City my title is chairman of the committee on immediate action. I have been an arbitrator for the coal miners and the coal operators in the State of Illinois for four years, and there I have been called an arbitrator. I distinguish very definitely between the two functions, and I suppose I have, in the early part of my life and along down, been functioning as an arbitrator. Latterly I am functioning as a mediator, with power to act.

The ACTING CHAIRMAN. With power to arbitrate?

Mr. WILLIAMS. With power to enforce my decisions, if I make any.

Commissioner O'CONNELL. If you reach what you consider a conclusion, and either side does not agree to it, you simply say that they shall.

Mr. WILLIAMS. Yes.

Commissioner WEINSTOCK. That is agreed to in advance by both sides?

Mr. WILLIAMS. Yes. If I may be permitted to explain, let me say that I do not think either side quite understood what the development was likely to be. I was taken in as an arbitrator.

Commissioner WEINSTOCK. What trades?

Mr. WILLIAMS. In Chicago in the men's clothing trade and in New York City in the cloak and suit trades.

The ACTING CHAIRMAN. Also in the coal trade.

Mr. WILLIAMS. My function there was more like that of an arbitrator.

Mr. THOMPSON. I will ask you to state, so that the matter may be clear, the machinery which you operate in. For instance, in Chicago, in the men's clothing industry, and there you actually are the chairman of the board of arbitration of three members?

Mr. WILLIAMS. Yes.

Mr. THOMPSON. Which has power to operate in the old-fashioned way if it wishes?

Mr. WILLIAMS. Yes.

Mr. THOMPSON. And in New York you are the third man on a board of three members, which, if it wishes, can operate in the old method?

Mr. WILLIAMS. Yes.

Mr. THOMPSON. That is to say, both sides leave it up to you and put the decision on your shoulders?

Mr. WILLIAMS. Yes.

Mr. THOMPSON. But what you want to say, or what you have said, is this: That while the machinery is such that you could act in your own personal capacity, your own method of acting is this, to bring about a mediation of the parties, always having in your hands the power to enforce a decision.

Mr. WILLIAMS. That is true.

Mr. THOMPSON. Taking first your own experience in the coal fields, will you give us a brief statement of the matters you have passed on as an arbitrator, and the arbitration machinery under which you have operated?

Mr. WILLIAMS. My first experience was a number of years ago, in which I had to pass on the general questions growing out of a strike. In that case it was a question of advance of wages and involved a prolonged investigation, and the finding was purely that of an arbitrator. Later I became the arbitrator under the present trade agreement of the miners in my State. In this case there were questions relating to individual mines, not general questions of wages, but troubles arising in the mines which came up to me and were adjusted in the fashion of an arbitrator, I should say, bringing in a decision in favor of one side or the other.

The thing is so very different in my mind that I almost share the feeling that has been expressed here by some of the employers against the old fashion. The old fashion contemplated that the person should act as if he were a supreme court. He should adopt the legal method; he should appeal to some kind of precedent or some abstract principle of justice or some view he might have on economic practices, and he would hand out a decision, perhaps, as somebody has said here, to protect himself outside of that compromise. At any rate, it was pretty certain not to be satisfactory; that is to say, if you gave in favor of one the other side would be dissatisfied.

Commissioner WEINSTOCK. You are speaking now of an arbitrator?

Mr. WILLIAMS. An arbitrator.

Commissioner WEINSTOCK. The old-school arbitrator?

Mr. WILLIAMS. The old-school arbitrator. I have practiced in that form, and it was never very satisfactory. I would say, though, that it might be capable of expansion in this manner: Suppose, as happens at a time of wage strike, if

the worker asked for more wages, the employer generally says he can not afford it; that the business will not stand it. That is, as I have found, the common plea—that he says competition will not permit him or the business will not warrant it. It seems to me that arbitration might be useful in that case if it were made a thorough-going investigation of the facts as to whether he can stand it or not. It seems to me if that were done and a complete exposé made of the facts, that such exposition, if thoroughly made, might be convincing. It might satisfy the workers that perhaps the advance was not justified. But rarely ever is that opportunity given. That means if the employer is told he must show us his books and accounts and entire business he may not take the attitude he has heretofore taken. I should say if we should take this step that perhaps this commission is designed to promote, of having State interference or regulation of trade, it would come to something after awhile like our practice in the public utility business. It would stand here to make an investigation of all the facts, and if it had power to contemplate what was a fair reward for capital at this time, how much would be necessary to keep it in business and to make adjudication based upon that kind of showing, it might be a good thing.

Commissioner WEINSTOCK. May I be permitted at this point to ask a question?

The ACTING CHAIRMAN. A question of definition but not of anything else.

Commissioner WEINSTOCK. I do not know whether my question will be exactly a question of definition; but the statement just made by Mr. Williams brings up this thought as to whether in his opinion the wage ought to be based on the cost of living of the worker or ought to be based upon the profits of the business?

The ACTING CHAIRMAN. Can you postpone that until he finishes his main statement?

Commissioner WEINSTOCK. Yes.

Mr. WILLIAMS. This is mainly for the purpose of trying to show the difference between the old practice and what I am going to come to next.

An arbitration of the old fashion might even be possible and useful where its researches would be of a kind that would shed light upon the whole question and tend to produce satisfaction between the parties. As I see the ordinary arbitration, it does not act that way, and the result, as has been shown here from many sides, is usually rather unsatisfactory.

If I may be permitted to go on in my own way I will just say that the kind of functions that are possible for a person acting between the parties may be perhaps naturally divided into two—the kind that belong to a business which has few internal changes within the period of the contract and those which are fluctuating widely from day to day. The first kind may include a trade such as the mining trade, where the things that may arise are so completely covered by the agreement as to details and precedent that they will adjust themselves with the machinery they already have, and only rarely will the arbitrators need to be called in. That is one form. The other type is an industry where there are constant variations, such as the clothing industry. I have been in New York now just one month trying this out. In that time we have had 506 complaints. Of these, 29 came up to this committee of which I am the head. The others were adjusted by the deputies. There, you see, are constant fluctuations. The price, instead of being made for a year or two years, is made for a day, almost, don't you know? The conditions are changing constantly. I think that this kind of industry offers in some respects a very much more favorable position for the mediators.

Commissioner WEINSTOCK. You mean in the fluctuating?

Mr. WILLIAMS. The first thing the mediator needs is to get the confidence of the people he is working with and for. It is relatively easy to satisfy the employer, because he has immediate access to it and he knows the business and there are few of him in number; while the satisfaction of the laborer is much more difficult. They stand at quite a distance removed from it, they do not understand the business, and it is hard to get their confidence. I may say here that it is my judgment that nothing is worth while that does not get the moral support of the worker. However much force you may put behind the decision, it would not get any distance in establishing peace unless you have the real assent of the people to whom it must apply.

The one in which the mediator comes in constantly daily contact and is passing upon the grievances of these people is the one that gives him daily opportunity to get acquainted with them. If he happens to decide against the

laborer to-day he will decide for him to-morrow, and there is a long enough period elapses for his personality to penetrate those men, so they may become acquainted. It is, therefore, possible for such an arrangement as that to work out what both sides desire, and that is stability, as has been suggested here, in the industry.

As has been testified here in reference to the Hart, Schaffner & Marx matter, we have in two years really had that result there. The people are working daily. Where there was a strike in some section nearly every day now it is very rare, a very rare thing, and the employers are able to count on steady production which, as has been suggested here, is of great value to them. We are just beginning in New York City, but we hope to have some such result there. There the sporadic strike is still a rather common occurrence. I think there were nine last month.

Commissioner WEINSTOCK. That is, in violation of their agreements?

Mr. WILLIAMS. Yes. The union has not yet—it has been suggested here, and it is quite true, that this union, however desirous they may be, and they are, more than we are, of enforcing their contract, they are unable to control these groups.

Commissioner WEINSTOCK. Why?

Mr. WILLIAMS. Because there is not sufficient spirit of discipline, and there is not sufficient confidence that justice will be given them by the commissioner.

Commissioner WEINSTOCK. You mean there is too much individualism?

Mr. WILLIAMS. Too much individualism, and perhaps too much ignorance and lack of training and lack of knowledge.

Commissioner WEINSTOCK. So that a man has to be educated to become a unionist, as well as anything else?

Mr. WILLIAMS. Undoubtedly. That is the most important part of the educational scheme—getting people to participate in the business of self-government through the union, and these people have a great deal of it to do, instead of, as in the case of the other organizations, where there are a few people who attend the meetings and run the whole business. It has a more beneficial effect where they are being educated constantly through their problems.

It goes without saying, of course, that if a man is endeavoring to administer that sort of proposal, that man has got to be a thorough believer in unionism. He is not disinterested or impartial in that sense at all. He must see to it that his decisions and the measures that he takes are calculated to strengthen the organization and make it as such more efficient. They must believe that the mediator is going to further their purposes by giving a strong union. Without a strong union the whole thing will amount to nothing, because we need a strong union to get the decisions enforced. A union—or a man who is at the head of a lot of guerrillas, undisciplined, he is unable to make them do what they do not want to do; but if you give him a strong union he can always bring the small group to terms; so that the first consideration must be that he is their friend, and he will see that their union is protected and made strong, and if he is there long enough he will have time to impress them that way; but if he just makes a decision this year and then goes away and does not come back until another year, or maybe doesn't come back at all, he is not likely to make them believe that the thing they do not like is a good thing for them.

As I say, this has been largely a development; it just grew out of the genius of the situation. We started in to arbitrate in Hart, Schaffner & Marx, perhaps in the usual way, and we developed from that into this way of doing it, until now frequently we do not have as many as three arbitrators sit. Most likely, if it is a case involving an investigation in the factory, a motion will be made that the chairman will make a personal investigation on the spot and decide it; and with two clerks he goes into the shop, and perhaps he will hear testimony right there and decide it on the spot, in the shop.

Commissioner WEINSTOCK. Do you still operate in Chicago?

Mr. WILLIAMS. Yes.

Commissioner WEINSTOCK. You swing between the two cities?

Mr. WILLIAMS. Yes.

The ACTING CHAIRMAN. When you speak of the clerks, what do you mean?

Mr. WILLIAMS. The clerk is the name given to them in New York, and the working head of the union. He is their representative to adjust difficulties, and represents the union.

The ACTING CHAIRMAN. He has practically the power of this board of arbitration?

Mr. WILLIAMS. Yes; in New York.

Commissioner WEINSTOCK. He is what they call in Australia a "cessar?"

Mr. WILLIAMS. In Chicago they give him the name of chief deputy, but it means the same thing.

Commissioner WEINSTOCK. You say you go by yourself?

Mr. WILLIAMS. With the two clerks.

Commissioner WEINSTOCK. You go there with them?

Mr. WILLIAMS. I can go there without them, without the other two members of the board of arbitration.

Commissioner WEINSTOCK. And the clerks in that case that you take there, would be what?

Mr. WILLIAMS. In New York they call them a committee of immediate action, but in Chicago they go as two deputies with the chairman of the board of arbitration, but, any name, the effect is the same.

The ACTING CHAIRMAN. As a matter of fact you, as chairman, do not go by yourself?

Mr. WILLIAMS. Not in that sense; no.

Commissioner WEINSTOCK. You are the only one that has a voice?

Mr. WILLIAMS. I mean the other two members of the board do not go. You know in Chicago we have three members of the board of arbitration—myself and a member chosen to represent the workers and one chosen to represent the employers.

The ACTING CHAIRMAN. I understand that it is the case in New York, that you call these members clerks instead of deputies?

Mr. WILLIAMS. It is not the same, because in Chicago, for example, we have three men—Mr. Thompson, your counsel here; Mr. Carl Meyer; and myself. We are the board of arbitration. When we sit in state, we sit in a sense as judges. But, as I say, in many instances, perhaps the majority of instances, Mr. Thompson and Mr. Meyer will say, "I move that this case be taken up by the chairman in person and that he visit the factory and get evidence and settle it." Do you see? They two do not go, but the chief deputy on each side does go.

The ACTING CHAIRMAN. Then the action there is strictly the old line arbitration?

Mr. WILLIAMS. Theoretically, it was intended to be that proposition, but practically it is not that at all.

The ACTING CHAIRMAN. You do not act as mediator to get the two sides together?

Mr. WILLIAMS. Surely I do.

The ACTING CHAIRMAN. No; they delegate it to you, to go and do it yourself?

Mr. WILLIAMS. That is still the theory. Let me say—here is Mr. Howard here, who is chief deputy for the employer, and Mr. Hillman, chief deputy for the working people. We go there, and they call out the chairman of the shop where they have trouble. Maybe it is a discharge trouble, or maybe it is a price trouble, or some other question—some discrimination charge, or unequal distribution of work. Well, you go to the shop, and the foreman is brought out, and the foreman of the shop is told to bring out the workers, and the chairman calls out the section particularly affected. They appear before us, and they testify. Then the three of us consult, and we agree about what is the best way of dealing with that particular situation, having regard for all issues involved, and we rarely fail to agree. You understand, we try to find a way that satisfies the interests of both parties.

The ACTING CHAIRMAN. As a matter of fact they do not leave to you an independent investigation; you have two people, under whatever name you call them, representing the two sides, going along with you?

Mr. WILLIAMS. Yes.

The ACTING CHAIRMAN. And those two people agree, and their agreement is your opinion, too?

Mr. WILLIAMS. Yes.

Commissioner WEINSTOCK. But supposing you differ from the other two. Then what?

Mr. WILLIAMS. Well, I am always sure of a majority, because I shall be for one or the other, you know, and you can always get two, whichever side it will be on.

Commissioner HARRIMAN. But suppose they are both alike?

Commissioner WEINSTOCK. I suppose there is such a thing as two of them having one point of view and you having another? Then what prevails?

Mr. WILLIAMS. Nothing like that has ever happened; it never has happened. I do not know just what we would do.

The ACTING CHAIRMAN. Did you ever make a decision in which one side agreed with you and the other dissented?

Mr. WILLIAMS. Yes.

The ACTING CHAIRMAN. What do you call that?

Mr. WILLIAMS. We just write it down as a decision and it goes.

Commissioner O'CONNELL. The other two, then, do agree with you?

Mr. WILLIAMS. There are some cases—there are some of our decisions in New York with only two signatures.

Commissioner O'CONNELL. And do they proceed to carry out your decision in that case?

Mr. WILLIAMS. Yes.

Commissioner O'CONNELL. Therefore they agree with you?

Mr. WILLIAMS. They do. It has been known that they filed a protest and asked for a rehearing.

Commissioner BALLARD. Have you ever been overruled?

Mr. WILLIAMS. You see I am the ultimate court in Chicago.

Commissioner WEINSTOCK. A supreme court. Have you ever overruled yourself?

Mr. WILLIAMS. I do not know; I have reheard cases, but I do not remember that we have changed it very much.

In New York the situation is different. This committee on immediate action takes up cases on the spot and passes on them. It would be possible there for them to be appealed to the board of arbitration, of which Mr. Brandeis is chairman.

Commissioner WEINSTOCK. Then you are not the final court?

Mr. WILLIAMS. Not there; no, sir.

Commissioner O'CONNELL. Are you employed by both sides?

Mr. WILLIAMS. Yes.

Commissioner O'CONNELL. Paid by both sides?

Mr. WILLIAMS. Yes.

Commissioner O'CONNELL. Is that the case in Chicago, too?

Mr. WILLIAMS. Yes. The difference is this, that the way we are actually pursuing it is more like a commission; the other way is more like a court. The commission plan takes account of the actual situation; it does not much refer to abstract principles of justice or statutes or any laws that have been made, but we find that actually there is a line of interests that are common to both; the action is rather that of discovery, of contrivance or invention to find a practice which will serve the interests of both sides. Of course you have the faith that there is such an interest; then your ingenuity and all that will be exercised to make those interests run parallel. So far it has been possible—it has been possible in many cases in such a way to avoid these recurring strikes, as I told you, to find that there is an interest that is not antagonistic, that there is enough to be gained by both sides, so that it is worth while to do it.

On the side of the company we seek to find a line that will give them efficiency, help their productiveness, give them stability, regularity of employment, and freedom from this everlasting danger of interruption by strikes. That is worth a good deal to them, and they are willing to pay for it; they are willing, if they are sure of getting it, and they are able to grant it, because they are made more effective, productively, by reason of this steadiness of employment, and they are ready to give some of it to the people by giving them advantages; whereas, if they were in a hostile state, they could not afford to do it.

So that it is possible to make it pay on both sides. I do not say that the line of parallel interests will continue indefinitely; there will come a time, probably, when the general question of how to divide the earnings of the business will come up, and it is quite possible that, if the employer was making 10 per cent, the workers would say "That is too much for you; I think 8 per cent is enough for you, and we ought to get the rest." That is something that can not be mediated, if they hold that position strongly. Perhaps, it could by arbitration; but only in the way that I have indicated—by showing what there is to divide. A strike might cost the company \$100,000, while to give the advance might cost them \$700,000, and they might prefer to do it. You can not eliminate that ultimate conflict of interests at that point, even by this method I propose, but those cases come rarely, while these other causes of trouble—grievances, complaints, and interruptions—are con-

tinuous, and it is worth everything to an employer to get rid of those; and it is surely as profitable to the workmen. It is on this particular line that we have developed within the last few years, and that is what I feel myself most competent to speak on, because it is the line I have had most to do with. I think you have had the testimony from the Chicago firm—that it has been very successful. In New York it has yet to be made a success.

Mr. THOMPSON. Will you state, so that the commission may understand, the machinery which is now in existence in New York for the adjudication of disputes, starting where you think best, to explain it?

Mr. WILLIAMS. This, too, is a development. I think about two years ago there was a great strike there. After that the protocol was formed, which is just a trade agreement. They foresaw this continual grievance, and they tried to provide for that, so they appointed a grievance committee—which should be a court of first jurisdiction—composed of a number of persons from the employer and the employee. If they should fail to agree, then there was recourse to this board of arbitration with Mr. Brandeis as chairman.

The ACTING CHAIRMAN. Who were the others?

Mr. WILLIAMS. Mr. Hamilton Holt and Mr. Weyl of New York.

The ACTING CHAIRMAN. Not in the industry?

Mr. WILLIAMS. No; I think they were all outside of the industry. I am speaking from hearsay, of course, because it happened before my coming; but I am told that the board of grievances—the commission—did not dispose of the cases fast enough, and it was charged, on the part of the union, that they were allowed to accumulate.

Nearly all of the complaints arise from the union, so that the failure to adjust a complaint was like deciding against the union. The number of the cases accumulated, and the union became more and more dissatisfied; they demanded that there should be an umpire, that there should be somebody to cast the deciding vote on that board. That led to fierce controversy in which several good men went down, and it very nearly ruptured the protocol and cause a general strike; but, perhaps, the sacrifice and devotion of some of the members in it—they resigned; they got out of the way—so that it would be possible to get the human element out of the way and permit the protocol to go on.

It was then changed to this plan that I have suggested, and the employers consented to have an impartial man, but with this change, that instead of this impartial man being at the head of the board of grievances that he was only to be one of three, and two clerks and himself, who should act as this committee, so that the board of grievances becomes a consultative body now and is now in active use for the adjustment of grievances.

It has a force of about a dozen or 15 deputies, who go out into the factories and first hear the complaints, and then, if they can not agree, they are referred to this committee of three, who have the final decision.

The ACTING CHAIRMAN. That is, a deputy from each side?

Mr. WILLIAMS. Yes.

The ACTING CHAIRMAN. Then, do you go to the two chief deputies next or to this committee on immediate action?

Mr. WILLIAMS. I think that was the original intention, to have the two chief clerks agree on it, but when I went there and asked how to do it, I said, "I will not wait until you disagree; I will go right with you into the factory, and we will go together and we will agree together," and this is the way I have done it; and thus far, permit me to say for your information, there has been no occasion as yet for the chairman to cast the deciding vote. We have been able to agree unanimously in every case.

Mr. THOMPSON. In regard to appeals, where do they lie from the decision of this board?

Mr. WILLIAMS. They lie to the board of arbitration.

Mr. THOMPSON. To the board of arbitration?

Mr. WILLIAMS. Yes.

The ACTING CHAIRMAN. Where do the chief clerks come in?

Mr. WILLIAMS. There are three members of the board of immediate action, and the two chief clerks and myself are that board.

Commissioner WEINSTOCK. In New York the clerks are members of the board. In Chicago they are not.

The ACTING CHAIRMAN. I do not quite understand. There are quite a number of clerks?

Mr. WILLIAMS. Deputy clerks. There are two chief clerks and there are 12 or 15 deputy clerks.

The ACTING CHAIRMAN. Do you always meet with the chief clerks?

Mr. WILLIAMS. Yes; always.

The ACTING CHAIRMAN. And not with the deputy clerks?

Mr. WILLIAMS. If the deputy clerks can agree, that decides it. There were 550 complaints last month, and the deputy clerks settled all but 19 of them.

The ACTING CHAIRMAN. And you took up those 19?

Mr. WILLIAMS. Yes; as I say, we agreed unanimously on those 19, so that we have had no conflict of opinion there yet.

The ACTING CHAIRMAN. This board of grievances still remains?

Mr. WILLIAMS. It still remains. There will be use for it, but its old function has passed.

The ACTING CHAIRMAN. Have you referred anything to that board of grievances?

Mr. WILLIAMS. Let me see. I think we had them together on some questions which we were not clear had been decided previously. We asked them to agree on some plan for adjusting certain things.

The ACTING CHAIRMAN. In that case did you consult with the board of grievances?

Mr. WILLIAMS. I think we will find a use of that kind for that board.

The ACTING CHAIRMAN. You would there be also a kind of mediator with the board of grievances?

Mr. WILLIAMS. In the last meeting I did not open my mouth. They did all the talking, so that I could not mediate very much.

The ACTING CHAIRMAN. But in case they split, or there was a deadlock, you would be called on?

Mr. WILLIAMS. No; I do not fancy that I would have a deciding vote there. This is still forming.

Mr. THOMPSON. I might say for the information of the commission that this board of grievances in New York has not been changed at all. It still consists of just 10 members, and under the agreement as made, under the protocol Mr. Williams only sits as chairman of that committee of immediate action, and as Mr. Cohen said yesterday as to the board of grievances, at the time we made this amendment to the protocol, it was understood between the parties practically that this board of grievances should be retained, and it is retained by the protocol, and that it would do actually legislative work. For instance, if there was need for some new agreement. Suppose that in the further working out of the protocol it is necessary to make some provisions, or say the union people insist that certain provisions ought to be made; they could not bring it up to the board of immediate action, because they have no legislative power, but they would bring it up to the board of grievances because they have power to legislate, and when that decision is not satisfactory to one party or the other, they have their appeal to the board of arbitration. The board of arbitration is the last place, the last resort of the parties. Suppose the business men should consider that the board of grievances and the board of arbitration had saddled on them a thing which could not work in a business way, which would mean destruction; they have a right at any moment to terminate the protocol and say, "We do not want it."

Is that all you want to say now, Mr. Williams?

Mr. WILLIAMS. I am ready to answer anything you want to ask me. I have this in mind that I would like to emphasize: what my experience seems to teach me is that it is not a question of machinery so much. You want enough machinery to do your work, but it does not so much matter what it is. What you want to do is to give effect to the human spirit. For instance, there should be some influence, some purpose, somewhere in the relations of employer and employee to serve the social end. Now, neither of the parties, each of them having their keen, pressing conflicting interests, are likely to regard that. We need the creation of some new force or institution that will stand there to say, "This is for the social end, something to represent that idea, so that you will not be able to make ducks and drakes, in your passion, of what really is of public concern, of public interest." The thing I think we are doing is that we have the nucleus of that sort of thing. It ought to grow stronger. I feel the necessity, even in New York, there now, with its rather scattering and fragmentary and conflicting interests, that there should be a central power, a sufficient body of influence, of moral pressure, so that if they became keen to rupture this thing and blow it up, there would be sufficient power to say, "You can not do it. There is an interest that is different from your interests. There

is the interest of the protocol itself that we will not permit you to wreck. We will not let you make this experiment fail, if we can help it." This is rather incoherent, it is rather formless, but it is a thing which I think rather needs to be built up. There is a need of something that stands to represent the public interest that is between these parties, and we must infuse that spirit in them from time to time, that they are working for a bigger thing than an increase in wages, or an increase in profits to employers; and this is a new function, and therefore I am laying stress upon this thing as the beginning of a new medium here, a new public function.

Commissioner WEINSTOCK. I should like to repeat my question which I presented a little while ago. In your judgment should the wage be based on the profit of the business or on the cost of living to the workers?

Mr. WILLIAMS. Of course, if I am obliged to answer and say one thing or the other, I should say that it must afford the American standard of living to the worker, that is, whatever the current standard may be. It ought to do that. If it can not do that, if we are forced to that, if we can not mediate and help to bring it up from time to time, it might involve the destruction of the industry, or that particular trade, and I should hesitate about making a rash application. But if I am obliged to choose between those alternatives, I should say that the worker must live, and live according to the American standard.

Commissioner WEINSTOCK. Then, you take the cost of living as the basis rather than the earnings of the business?

Mr. WILLIAMS. I would say, as between the two, it might be that the industry would not be able to yield the American standard of living to-day, but if you nursed it along a little while it might do so next year. I would not want to adopt any rash and arbitrary measure.

Commissioner WEINSTOCK. Then, you would say as a rule you would take the cost of living?

Mr. WILLIAMS. Yes; and we would modify that by the conditions.

Commissioner WEINSTOCK. Assuming that the parties had taken the cost of living as the basis and had fixed the wage accordingly, and then the profit of the business increased, it increased in prosperity and the earnings of the business increased, would it be equity, in your judgment, to increase the wages proportionately?

Mr. WILLIAMS. These are more or less economic questions. I do not know that I am fully clear on it. I should be generally in favor of any arrangement that would make the workingman a partner in the business. I mean that the ultimate of trades-unionism is copartnership.

Commissioner WEINSTOCK. You mean profit sharing?

Mr. WILLIAMS. It might be by agreement and it might be they would say "You can afford to pay us more and you ought to pay it." At the same time it might be with regard to the conditions of the business; he might be able to pay it this year, and it might be that he would lose a lot next year. I should think we might meet that when we came to it.

Another thing would be that the cost was put on the consumer and the consumer should be regarded.

Commissioner WEINSTOCK. I think your point of view is very important in this thing, because this is really a basic wage. Summing up, then, I gather that your opinion is, again, that the basis for wages should be the cost of living modified by the conditions existing in the industry?

Mr. WILLIAMS. If a business can not be conducted in this country to yield the basis of living it had better be done in some other country where it can.

The thing that I wish to make my contribution, however, is this. It is not for the worth of my opinion about any ultimate problem, or that I would feel competent to describe the ultimate solution. This is merely tentative, and goes to the next step of the industrial problem. That next step must be by trying to establish cooperative relations between the employer and the employed with this mediating body, whatever you choose to have it, so that you may assure to the workman that his economic rights shall be maintained, his human rights shall be regarded, and that he shall be put in a position of such knowledge as will let him know, so that there will be sufficient publicity so that he will know, what share he is getting.

Commissioner WEINSTOCK. That question I put to you is a question that is perplexing the minds of the greatest authorities on labor problems, the world over. For example, in Australia the basis there is that the worker must be

afforded a living wage, and that if the industry can not pay that living wage it had better die.

In England, talking with Lord Asquith, his statement was that while we must not lose sight of the living wage, yet on the whole he felt that it was better to afford to many people half a living than none whatever; it was better that they should make a partial existence than become totally dependent upon society; so that there you have two very opposite points of view from two great authorities.

Mr. WILLIAMS. I should say that is very easily explained. Lord Asquith is in a country which already has its population and its means of wealth production, and their ability to produce might be able to yield there three or four hundred dollars a year, when it might not yield \$1,000 dollars, and it is a question of how much they should be allowed to get out of industry. He takes the political view of it and he feels like keeping England up to its fighting strength; but we have not those problems here. He might properly take that ground as a statesman, while here we not having to face those problems, might more easily yield to the other view of it.

The main thing is to bridge this chasm that has been referred to in this country at this time, and establish cooperative relations between the two parties, and interpret them to each other, so far as the conflict is due to a total misunderstanding—to imagining. Why, the most prolific cause of unrest and discontent among the working people is vain imagining. They think that the employer is making a lot more than he is, often; they think that he is bent on oppressing them, crowding them down and out, and that he is hostile to them—and he is, sometimes, fearing that they are going to destroy his business. Now, it is possible to remove those sources of unrest and friction, and the machinery that I have indicated this morning and the spirit that I have tried to give out is thus far the result of my experience in just that little province.

Commissioner WEINSTOCK. May I put the same question to you that I put to Mr. Francis a while ago: What do you think is the missing link between capital and labor?

Mr. WILLIAMS. You imply in your question that there is a missing link, of course.

Commissioner WEINSTOCK. The fact of strikes and lockouts is the proof of it.

Mr. WILLIAMS. I should say that I am the missing link. [Laughter.]

Commissioner WEINSTOCK. You are evidently a believer in the Darwinian theory.

Mr. WILLIAMS. Not retrospectively. [Laughter.] What I mean is that you have got to have a bridge, a nexus, to connect the interests of these two sides. Fundamentally, while not identically in the popular sense, there is there a community of interest which an ingenious mind, an inventive mind that wishes to find it, can find; he can discover it, and he can so display it and make it clear to both sides that they can see it, and many of these things that cause most of the trouble can be eliminated in that way; and you need not only the conciliatory link that you see before you now, but you need the development of that idea and ideal until you get a body of influence working in the direction of correcting these obvious abuses and bringing the two people together, finally resulting, sometime, in a clear understanding of what the partnership is and what share each is to get. I think really it is possible in a degree to approach the end that the socialists have in view without revolution. I think you can pass right through the stage we now have into the stage whereby the workman will know what state the business is in and will know whether he is getting a share of the profit comparable with what is ideal, or what he may think he ought to have.

Commissioner WEINSTOCK. Do you think, then, in these large enterprises it would be wise and expedient for labor to be represented on the board of directors by voluntary action of the capitalists?

Mr. WILLIAMS. I would not say what form it should take. I should say that result should be secured; that they ought to know about the business.

I think there is another very important addition that must be made, and that is, that the workman must need to know that in a large measure his wages come out of the wages of other people; that is to say, a man in the clothing business, if he is able to force up the price of a suit of clothes from \$20 to \$25, must know that in the main his fellow workmen pay for it. One of the important questions to be settled, as we proceed in this line, will be how much ought the common laborer to get when you say the builder gets \$5 a day. What is the relation as between laborers and their earning power? What shall the

unskilled laborer have? What shall the skilled laborer have? It seems to me, when the American Federation of Labor comes to their own, it will be a court where there shall be an adjudication of the relative scales of various men in its employ, and it will say to somebody who simply has a monopoly of the power and is able to force up prices to \$6 or \$7 or \$8 a day, and strike if it is not done, "No, you can not do so. You are getting now more than your share." There must be an adjudication as between workers of their share of the common earnings, and then an adjudication as between employee and employer as to their respective shares.

Commissioner WEINSTOCK. Would you regard this as a fair way to arrive at these differentiations in wages—that is, the method pursued in Australia? In Australia they take as the base the unskilled laborer. They determine what that unskilled laborer can live for in decency, and from that they build up, paying the skilled workers the usual differences as shown by past experience, between the unskilled worker and the skilled worker; and for the laborer on a building, and the carpenter and brick mason on that building, they maintain as nearly as they can the ratios established by past experience, taking the unskilled laborer as the basic factor.

Mr. WILLIAMS. As to the way in which you would do it, I have no right to have an opinion, but that it should be done I have none. I think rather that kind of a division should be administered by the trades themselves. The should stand there and say to each other, "You must be fair, and because you have the power over here, and because you have a strong union on the one hand, and these poor day workers have not any union, you can not hog it all." That is to say, you recognize what the I. W. W. is clamoring for—that the aristocratic unions shall not take the cream off of the thing and disregard the rights of the workers that are not so well organized and have not so much power to compel their rights.

Commissioner WEINSTOCK. Would you restrain the strong unions for the protection of the weaker ones?

Mr. WILLIAMS. I would rather have them restrain themselves. I think it could be done by a congress of labor, managed by some such organization as the American Federation of Labor.

Commissioner WEINSTOCK. Were you here the other day when Mr. Briggs testified?

Mr. WILLIAMS. No, sir; I was not.

Commissioner WEINSTOCK. Mr. Briggs represented the employers in the metal trades. He took the ground that as the result of his long experience and observation, unions were not desirable for the workers themselves; that he thought they could fare very much better under a system of individual bargaining than under a system of collective bargaining. What is your judgment on that point?

Mr. WILLIAMS. I have no sympathy whatever with that view.

Commissioner WEINSTOCK. You have not?

Mr. WILLIAMS. None whatever. I am not an individualist, and I do not believe they would fare as well in any way. Trade-unionism is the greatest educative force that we have. It is through their unions the men become intelligent in the things they need to know most about. It is the best school of ethics we have. Even at its worst, it compels one man to subordinate his individual greed to the interests of the group. Even if it is a predatory group, at least there is that much in it. In the main, the trades-union affords the men the most practical school we have now of social and industrial and ethical principles.

Commissioner WEINSTOCK. I take it from your point of view, if unionism were wiped out in this country it would be in the nature of a calamity?

Mr. WILLIAMS. Undoubtedly. What we want is more unions and stronger unions. They gain responsibility in number and power. It is the weak union, the one in which the leader must fuse his people, that you have the most danger of, and the most trouble from. It is an unfortunate part of our human nature, applicable to unions as well as to churches, that the thing that will enable men to fuse into a body or group is the jingo spirit. If the Protestant Church goes for the Catholic Church, it is done by a feeling of hostility, of getting them to stand for their rights. If a union starts for any purpose, the easier thing to get them to rely on is that idea that they must make war on the employer, which has been unjust and unfair; and so this common psychology which we have makes that the easy way to get this thing done; that is, fuse a body together for any one purpose. The danger is they will never get past that

stage. They certainly will not if they are weak. When they get large and strong, they get a sense of responsibility to other people. There is a passing into the second stage, which is that of wanting to cooperate in production, of having the one got rid of, and of developing a social sentiment and ethical sense of justice.

Commissioner WEINSTOCK. Is there any sympathy between organized labor generally that is represented by the American Federation of Labor and the I. W. W., for example?

Mr. WILLIAMS. I can not speak with any authority on the subject.

Commissioner WEINSTOCK. Are there any I. W. W.s in the organization with which you have been brought in contact as mediator?

Mr. WILLIAMS. I do not know whether there are any members or not. Of course, wherever you find that refractory spirit, that unwillingness to submit to discipline, you have what we have been associating with the I. W. W. idea; but the I. W. W.s would not be very different from the other people if they had a proper organ of expression. It is just that sense of futility of their lot, of their means of action, that makes people resort to these measures of force. If they had a proper organ of expression, the I. W. W., just as soon as they get big enough and strong enough, will develop conservatism.

Commissioner WEINSTOCK. The radical of to-day would become the conservative of to-morrow?

Mr. WILLIAMS. That is history.

The ACTING CHAIRMAN. Mr. Ballard, do you desire to ask any questions?

Commissioner BALLARD. Mr. Williams, you spoke of working in Chicago and working in New York. You said you are also connected with the mines of Illinois?

Mr. WILLIAMS. Yes, sir.

Commissioner BALLARD. Have these systems of mediation and conciliation and arbitration been as fortunate in mining as in other places?

Mr. WILLIAMS. The mining industry is one of those trades in which the kind of complaints liable to arise have been so standardized, have been so much the subject of regulation and rule, that the kind of mediation that I am testifying about is not applicable there. There have been so many precedents that they are able to adjust them without difficulty or without calling in an outside party, very frequently.

Commissioner BALLARD. In the development of the principle of conciliation and mediation which might be national in its character, do you feel that if the various labor organizations should appoint a committee, and the various employers should appoint a committee, they might, eventually, together draw up a declaration of principles which might be accepted by all the employers and by all the employees as fair and just and workable?

Mr. WILLIAMS. You are asking for just an opinion, and my opinion would be that you could not be very democratic about it. You would have to get the workers to believe in it. You might get such as the I. W. W. people now, a lot of people hostile and rebellious, and they would not want to help make it go. They would rather believe in fighting. If you wanted a conference of people of that kind, you would need to get the people that knew about it and believed in it.

Commissioner BALLARD. You think if they did formulate a declaration of principles which might appeal to the good sense and good judgment of the public generally, that would have some influence?

Mr. WILLIAMS. I think it would be a good thing to make an effort to get representation in any conference you might have of both sides, so it would carry that weight. I know in my State we had the mining laws to revise last year. The governor appointed three men from the employers and three men from the employees, and appointed three outsiders, of which I was one. It turned out we were about the only ones that did much. We codified the laws of the State and revised them, and they were passed without discussion by the legislature, and they are now the laws of the State.

That was one of the applications of that idea in Illinois.

Commissioner BALLARD. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Delano, do you desire to ask anything?

Commissioner DELANO. Mr. Williams, we have been trying to find out in these hearings this week what kind of collective bargaining is successful and what kind is unsuccessful, and why; and what kinds of conciliation and arbitration are successful and what kind are unsuccessful. You have brought out some of the points. I do not know whether you have said everything you

want to say on that proposition. I particularly want to get your idea on this matter of the umpire or referee to cast the deciding vote. As I get your point it is that the longer a man serves in that capacity, the better it is understood by each party, and the more willing each party is to accept the casting vote of that individual, and that perhaps the reason why the umpire has been unsuccessful in some cases is that he has only acted in one case and then dropped out, and that sort of arbitration or casting a vote results unsatisfactorily and results simply in a compromise, which is more or less unsatisfactory.

Do I understand you correctly in that?

Mr. WILLIAMS. I think so. I would say that the work is actually a work of construction. When these three people get together and find a problem before them, it is much like a problem a scientist might have, or any other problem of law or ethics. It is a question of what is the best solution, taking into account all the factors in it, and having regard to all the interests involved. The employer would say, "I would like to do that, only I am in danger of having this thing follow: There will be less discipline, or maybe something else." Then they say, "How can we give the men what they want and yet protect you? What kind of a contrivance can we make?"

When you get all the factors of the problem and get three fairly good heads together, you will find a very different solution of the problem that will take care of the interests of all of them in that problem. You can not refer to any abstract rule or decision, or anything that is behind you. You have to make a construction. That is especially true with regard to these industries where difficulties are constantly arising and conditions are varying from day to day.

Commissioner DELANO. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. O'Connell, do you desire to ask anything?

Commissioner O'CONNELL. Nothing.

The ACTING CHAIRMAN. Mr. Lennon?

Commissioner LENNON. I want to ask just one question, I believe. I understood you to say, Mr. Williams, in order to minimize evils of industrial conflicts, you consider it necessary for a new force to come in, or a force that we are just beginning to think about, for the social good. Do you believe it is possible, by the organized State, to intervene by means of legislation in such way as to promote this new force of social good to minimize these evils?

Mr. WILLIAMS. I should say yes; although I would not be able to describe just the way. The handicaps at the source are of course obvious to you. With our present political situation, you would readily see the handicap a man might be under who came there even with the best intentions. Let us say I have built up a fair reputation and want to serve these interests where I am. If I go into a strange city as a commissioner from the Government I would be met with the thought at once: Here is a politician; here is a fellow that has a pull and has an office. I think that would be impossible, in the main. That would be, as I conceive it, about the heaviest handicap he might have.

Commissioner WEINSTOCK. He would be immediately discounted?

Mr. WILLIAMS. He would fail to get his confidence which is indispensable to success—that belief of the workman that he is going to get a fair deal is an indispensable condition for the success of the mediation.

Commissioner LENNON. Do you believe that would be within the province and right of the Government, to institute a council or commission, no matter what it is called, that would make a real, intensive, scientific study of different industries so as to have the detailed information at hand upon which to base wages and those things?

Mr. WILLIAMS. That is what I suggested previously. I believe that what the Government might do would be to institute some sort of commission that would have the right and have the power to go in and remove the grounds of misunderstanding and misinformation that men might have as to the profits of the employer; that they could go in and make a complete showing, so that the worker would not be thinking all the time that the employer is making mountains of money, and he was not getting his share. They would have the power to do that, and could at least do that much. That would stop a great many strikes, I think.

Commissioner LENNON. You feel, I judge from the expression which you made, exactly as I do—that the principal cause of unrest, and I mean this in a general sense, is because people do not understand each other?

Mr. WILLIAMS. I have found that is true in a very large measure.

Commissioner LENNON. And if men want to serve society the best thing they can do is to endeavor to get the people closer together and strengthen the human touch?

Mr. WILLIAMS. Yes.

Commissioner LENNON. That is the reason why you gave expression to the idea that the mediator in order to be successful must get the union's confidence, that he wants to serve them, not only as to decisions, but wants to serve them in order to strengthen their organization?

Mr. WILLIAMS. Yes, sir; unquestionably. I do not believe the unions would have any confidence in a mediator that did not accept that as a fundamental thing—that he was there to help make their union strong.

Commissioner LENNON. I wish we had time, because I would like to ask something about the Cherry mine disaster.

Mr. WILLIAMS. That is another case of mediation.

Commissioner LENNON. Yes; I know it was.

Mr. WILLIAMS. I will only say that in the Cherry mine disaster the efforts of mediation resulted in preventing a lawsuit involving a great number of claims, and the company recognizing a moral liability to pay out half a million dollars, which they did.

Commissioner LENNON. That is all.

The ACTING CHAIRMAN. Mrs. Harriman, do you desire to ask any questions?

Commissioner HARRIMAN. Mr. Williams, I understood you to say that you believe unionism is the greatest moral and economic educator of the worker. I wondered if you had any explanation why unionism is spreading so slowly.

Mr. WILLIAMS. No; I have never thought of it.

Commissioner HARRIMAN. The statement has been made here that less than 8 per cent of the workers are organized.

Mr. WILLIAMS. I would not have supposed it was so small.

Commissioner HARRIMAN. Some one else said it was less than 10 per cent, but it is not larger than that, I believe.

Mr. WILLIAMS. Of course, I did not mean it with reference to the magnitude of the problem; but I mean that for those who go into the unions it is the greatest educator to-day; it is the greatest democratizer that we have.

Commissioner HARRIMAN. Granting that is so, I wondered if you had any solution.

Mr. WILLIAMS. I should think that this publicity that we get through this means would help greatly. There are many large employers that stand against unions. Some of the largest of our corporations will not have them. They say they are afraid the unions will destroy their business or injure them. They will not give the power to anybody else to interfere with their business, if they can help it. Very rarely does an employer come forward and say, "I want a union," de novo. Then, you generate this heat that is the fusing power to get organization. We have a case in the copper country, and it has been suggested I should go up there. I declined for the reason that from my information and belief, I believed the employers would not consent to it. They would not transfer their power—and that is what it means. They would not part with their power, and nothing but compulsion would make them do it. It is not the place for a mediator. That is the place for fighting. Nothing but fighting will ever compel those people to do it.

Commissioner WEINSTOCK. The side that has the biggest stack will win out?

Mr. WILLIAMS. Very likely.

Commissioner BALLARD. Why should they be so opposed to it?

Mr. WILLIAMS. Because unquestionably unions have been mismanaged in the past, especially young unions. They fear their business would be interfered with and injured, and perhaps they may think in that business it would cost them more, and their profits would not be so big. I do not know the facts in the case.

The ACTING CHAIRMAN. Some question was asked in regard to your idea of what either the State or the Federal Government should do by way of a commission of some kind. Would you give that commission any compulsory authority or power? I am just now getting at the general view, based on your knowledge, as to what appears to you to be the extent to which we could go in recommendation.

Mr. WILLIAMS. I have not earned the right to have much of an opinion on that. My impression, offhand, is that with my feeling of the reluctance with which the workmen would accept a compulsory decision and feeling of impossibility of enforcing that decision upon the workman, I should be rather hesitant, don't you know, about adopting compulsory power for decisions.

The ACTING CHAIRMAN. For present purposes, at the present stage of the game, you think that would not be wise?

Mr. WILLIAMS. As I say, my opinion is not worth recording.

The ACTING CHAIRMAN. Suppose you take the ground next that it should have only advisory or only mediating power, the question then would be—you expressed the opinion that persons on such a body having the reputation of being politicians would not be useful as mediators.

Mr. WILLIAMS. That is the handicap we suffer under, of course, for being the kind of politicians we are. Perhaps you could reform it so as to put the politician into good repute, but at present it is more or less discounted.

The ACTING CHAIRMAN. Have you any idea why it is that that kind of people do get into control of these bodies?

Mr. WILLIAMS. They do not always; I am ready to admit that this body here is not.

Commissioner WEINSTOCK. This body is not what?

Mr. WILLIAMS. Composed of politicians.

The ACTING CHAIRMAN. This body is a temporary body, and it goes out of existence, and it can not be considered a mediating body; but why is it, taking it from a little different angle, how is it possible to select this missing link, this competent mediator, of whom we have as yet found very few? I think you are perhaps the first witness that has appeared before us that we could identify.

Mr. WILLIAMS. Thank you.

The ACTING CHAIRMAN. Now, it looks as though he has had to go through a period of training, he has to change his own views; it looks next as though he had to be competent to get the confidence of both sides; it looks next as though he ought ultimately to have the power to decide given to him in order that his functions of mediating—

Mr. WILLIAMS (interrupting). That is indispensable, I think.

The ACTING CHAIRMAN. Yes. How can we, as a general proposition—suppose we consider that the whole question of unionism will very largely turn on securing that type of man, available for all these thousands of disputes in all these unions. How can you suggest any recommendation as to the development of a business of that type, which would be not simply the accident of one man, I might say, who is particularly qualified, but how can we find such men, to make it a professional business?

Mr. WILLIAMS. I think the first thing to be done, if such a thing is desirable or practical—I do not doubt in the least but that we have plenty of men here that would fit into that situation admirably. I think that the incentives are the greatest anywhere. I do not know of any political position that I would value as much as the position that I hold now, so far as dignity and self-respect are concerned. I believe the rewards in a profession of this kind are so great that it would attract men as soon as it was known that it was possible to have it institutionalized; you would have the best and highest type of men, to whom the rewards would be nothing, and they would come from any business to engage in it. I do not believe there ever was as much social spirit in the world as there is right now, and I believe there are many individuals who could be found that would possess the qualities needed to make it a success, because their success would be in inverse ratio to the number of decisions they would give out; it would be according to the number of agreements they secured. They would think of the success of the arbitration and of the protocol as beyond any other success, and they would make it work.

The ACTING CHAIRMAN. Then you think if we would make this sort of recommendation, that conciliation in the form of arbitration should be recommended, that that would have weight with the legislatures and with the industries of the country—you think the type of men needed to carry it out would be forthcoming?

Mr. WILLIAMS. Oh, unquestionably, if they could go to the job; if they did not have to go through politics to get it.

The ACTING CHAIRMAN. Well, then, it is necessary for us to find some scheme of getting them. Have you considered the method of civil-service examinations for such a position?

Mr. WILLIAMS. No; I am not prepared. As you see, it is a comparatively new development. I have not thought of it in connection with the Government; I have only thought of making good myself, so as to show that it can be done, and that other employers and unions will be influenced to try it out. Here is your missing link that has been spoken of so much. This wide chasm

needs to be bridged, and experience has shown me that the best bridge possible is that of the human spirit as a mediating force—a man who will not be disinterested, but, on the contrary, will be tremendously interested to have both sides succeed.

The ACTING CHAIRMAN. It has been suggested that this commission should recommend an organization similar to the industrial council in England. Do you know what that is?

Mr. WILLIAMS. Only vaguely.

The ACTING CHAIRMAN. Do you know that it is composed of equal numbers of representatives from organized employers and an equal number of representatives from organized labor, and it is a mediating body? Would such an organization of that kind, do you think, be able to pick out mediators and arbitrators of that kind?

Mr. WILLIAMS. It might, if it did not have any political debts to pay.

The ACTING CHAIRMAN. Making such an organization, in other words, a civil-service commission for that purpose?

Mr. WILLIAMS. I have no opinion on that worth anything, because I have not thought strongly enough on it, and I do not wish my opinion to be any more than just one contribution into the symposium you are getting at, and it will be placed with the information you are getting from other sources; and I wish to center my emphasis upon the kind of thing we need and, in a way, counter the objections to arbitration that have been offered here.

The ACTING CHAIRMAN. To get at it a little closer, how were you first selected as an arbitrator or mediator before people knew you had the qualities that would fit you for it?

Mr. WILLIAMS. I am afraid that a recital of my experience would be discouraging, in a way, as to qualifications. I had to live 40 years in one town until people could inquire all about me and satisfy themselves that I was on the square. Then, my early mining and trade-union experience made me known to the miners; and then, being called on at different times—in every strike I was called in as a mediator, or as a volunteer butted in—and they got to know that I was friendly. That is what I had to go through, but that might be shortened for somebody else.

The ACTING CHAIRMAN. You had to be selected by the joint action of opposing interests?

Mr. WILLIAMS. Surely.

The ACTING CHAIRMAN. So that you would say that it is indispensable that the representatives of the two interests should make the decision?

Mr. WILLIAMS. I do not want to say anything that will bind any further action. I say that is the way it has been proposed, so that the Government might acquire the confidence of the people to such an extent that the people would accept whom they might ultimately appoint. I do not wish to say that I think that that is coming right away, but ultimately it might come to that. I intimated some time ago that it would result in a body with authority that could settle a large strike—for instance, a strike in the railroad industry or a strike in the coal industry—in such a way that it would have the power of one of our boards of public utilities now. They could tell a corporation now what is a fair profit, and an ultimate board of arbitration might come to that some time; but it is ultimate and not proximate.

Commissioner WEINSTOCK. Would it be so difficult to find these men if they were appointed by the Government, not men taken out of private life, men who are not widely known, and who would be looked upon with more or less suspicion; but if he has held a public situation, his record, and character having become generally known, he is sized up quickly, and both sides have means of determining whether he is the right man for the place or not and entitled to their confidence.

Mr. WILLIAMS. That would be so in some cases; there are some men who have been in public life and conducted themselves in such a way as to cast luster upon themselves. If that is true, that would help.

Mr. BARNETT. In the Chicago Hart, Schaffner & Marx conciliation scheme do the underdeputies, not the chief deputies, have power to settle any case which comes before them? Are there any restrictions on the kind of cases they may settle?

Mr. WILLIAMS. Mr. Hillman had better answer that question. He is the head of the organization, and I will leave that to Mr. Hillman.

Mr. BARNETT. Perhaps Mr. Hillman can tell us.

Mr. HILLMAN. There really was no definite arrangement. As a rule, the deputies—not the chief deputies—if they feel that this case is a little too big for them, they would just give it to the chief deputies. As a rule, everything they decided was always satisfactory; we never had to overrule them; but on principle we have the right to do that, the chief deputies.

Mr. BARNETT. The decisions are reported to the chief deputies?

Mr. HILLMAN. Yes; every detail of the investigation is reported to the chief deputies.

Mr. BARNETT. And if those decisions do not conform to principles which have already been established, or precedents already established, then what?

Mr. HILLMAN. I would like to say that we do not follow so many precedents. We always used to say, "We will face the situation as it presents itself," and if we found that we had made a foolish decision a year ago we did not have to be bound this year by the same decision.

The ACTING CHAIRMAN. Thank you very much, Mr. Williams. We will now take a recess until 2 o'clock.

(Whereupon the commission took a recess until 2 o'clock p. m.)

AFTER RECESS.

The commission resumed its session pursuant to the taking of recess.

The ACTING CHAIRMAN. Mr. Thompson, are you ready to proceed?

Mr. THOMPSON. Yes. If the chairman please, Mr. King is here, and we would like to call him first.

TESTIMONY OF HON. W. L. MACKENZIE KING.

Mr. THOMPSON. Will you please give the reporter your name, address, and occupation, Mr. King?

Mr. KING. W. L. Mackenzie King; my address is Ottawa, Canada; and I am a journalist at present and take an interest in public affairs.

Mr. THOMPSON. In the past have you had connection with the administration of the Canadian industrial disputes act?

Mr. KING. Yes; I had a good deal to do with it.

Mr. THOMPSON. What has been your connection with it, and how long did it continue?

Mr. KING. I drafted the act to begin with, and administered it part of the time as deputy minister, and part of the time as minister of labor in Canada.

Mr. THOMPSON. Are you familiar with the practical application of the act?

Mr. KING. Yes.

Mr. THOMPSON. And the instances in which it was applied?

Mr. KING. Yes; I was with most of them.

Mr. THOMPSON. And you are able to speak with knowledge of the facts?

Mr. KING. I think so; yes.

Mr. THOMPSON. Will you tell the commission the reason for the inauguration of the act, the purposes for which it was intended, and in what instances it has been applied, and how it worked, if you please?

Mr. KING. That would take rather a long answer, Mr. Thompson.

Mr. THOMPSON. It is the desire of the commission to allow you to make your statement in your own way, Mr. King, if you would like to do that.

Mr. KING. The act grew out of the experiences in the settlement of industrial disputes. When the department of labor was first formed in Canada the only act under which there was power to intervene in industrial disputes was a conciliation act modeled on the conciliation act of Great Britain. That gave to the Government the power to appoint a conciliator when an industrial difference arose and to use his good offices to bring about a settlement.

I happened to be appointed the first deputy minister of the department, and one of the first strikes that came up after the department had been formed I was sent to intervene in as a deputy minister. Having had some good luck in that strike I was sent to intervene in others, and the result was that for a number of years I was intervening as a conciliator in these individual strikes as they arose.

In 1907 there was a large strike that took place in the Province of Alberta, in the coal mines, in the spring of the year. I was in the old country during the year, but when I got back the premier asked me if I would go out to British Columbia and try to settle the difference. I went out and, to make a long story short, it took about two weeks to get that strike settled. The serious

part of it was that the prairie Provinces of the west were dependent on these mines for coal, winter was setting in, and the people in that district were facing the approach of winter with the possibility of starvation from fuel. Getting down into the district where the coal mines were, however, neither of the parties to the dispute seemed to consider that aspect of the case at all. They were thinking of their own particular grievances. After that difference was settled and I came back to Ottawa, the premier said: "We have got to draft some kind of a measure that will help to make this sort of thing impossible, if we can."

My experience there and in connection with other disputes had led me to believe that if we could put through an act which would compel the parties to a dispute to act together and provide some legislation that would get at the facts when they got together, that a large percentage of the industrial disputes would be saved.

I mentioned this circumstance to Sir Wilfrid Laurier at the time, and he said: "You had better draft a measure embodying those principles."

The industrial disputes investigation act is simply the result of that conversation.

The act is not original; it is based on legislation in other countries. The phraseology of it, a good part of it, is from legislation in New Zealand, and some of it is copied from State laws in this country. The feature of the act, however, is that it compels parties to an industrial difference to meet together and it affords the machinery whereby they can get at the facts when they are seeking to arrive at a settlement.

There is nothing compulsory in the act as to the acceptance of a finding of a board established under its provisions. The parties are expected to meet in this fashion before they strike or lockout, but once a board has been appointed under the act the parties may do what they like as to accepting or rejecting the award.

I might say that such limited experience as I had in dealing with these disputes showed clearly that one of the great difficulties in every strike was to get the parties together. That same thing came up on one occasion after the other. Employers would not meet so-and-so because they were belonging to a union, because they had become obnoxious, through personalities or other causes. Then there was also the difficulty that even when we got them together a question would arise as to some point of fact, and there was no way of compelling evidence—the taking of evidence under oath; and it was personal experience, largely, in that particular that made me believe that if those two points could be properly provided for the settlement of the industrial differences would be easier.

The provisions of the act are simply these: It applies, in the first place, to any dispute in the nature of public utilities—all transportation companies, transportation by steam, by electricity, to public-service corporations, agencies of communication and transportation.

It is a Federal act, administered by the Federal Government, and applies to the whole of the Dominion. It does not include all industries. The reason of its being limited to the particular industries that it covers is that, being a Federal measure, it is difficult to administer over so vast an area, and the industries to which it applies are more or less in the nature of industries upon which others are dependent, and the public in particular is affected by.

Well, in regard to any of those, where the difference is likely to result in a strike or lockout, the parties are by law, either of them, required to ask for a board of investigation. They send in an application to the minister of labor, and if it is made in conformity with the form of the act he then calls upon each of the parties to name a member of the board. They may name any person they please, provided that the person so named is not financially interested, and those two persons are given three or five days within which to agree upon a third man as chairman of the board.

If they are unable to agree or either party refuses to name a member of the board, then the Government, through its minister of labor, appoints a party in place of the one refusing, and that party acts as chairman.

The three members of the board are given all the powers of the court; they may compel the production of documents, take evidence under oath, or subpoena witnesses. They are paid \$20 a day each, I think, and expenses. The witnesses are paid. The whole expense of the investigation is carried on at the expense of the State.

This board uses its good offices to try to effect a settlement. If they are unsuccessful in the matter of drafting an agreement between the parties they

issue a report stating what in their opinion should be done to bring about a fair settlement. That report is made to the minister and given out by the minister to the press. Once it is given out the parties are free to do what they please—either strike, lockout, accept it, or do nothing.

The act was passed in 1907. It has been on the statutes now for seven years. I do not know what the latest figures are, but I think the last report of the department of labor, which brings it up to March, 1913, shows something like 147, and that out of the 147 all, with the exception of 20 resulted in the strike being prevented and the differences immediately settled, and the disputes that the board have had to do with have been the most important of the disputes we have had in the Dominion in that time, I think. That is about all; I think that covers it.

Mr. THOMPSON. What was done with reference to the 20 cases that were not settled?

Mr. KING. I think on those cases there were strikes. So far as I have been able to see, in no case where the strike followed the finding of the board was there any gain beyond what was recommended by the board itself. I do not know of a single instance where, a recommendation of the board not having been followed, anything better was obtained as a result of the strike.

Mr. THOMPSON. Do you know whether, in the 20 cases that went to strike or lockout, finally they were adjudicated by arbitration or conciliation?

Mr. KING. No; in every case the matter of one side giving in—no, they scrapped on until they got tired of it.

Mr. THOMPSON. Do you know whether in those cases the side that won would concede the findings of the public body, or would they insist upon their own contentions?

Mr. KING. Well, my impression, speaking roughly, is that in some cases settlement was ultimately made on the basis of the award that the board had put out, and in other cases terms not as satisfactory were the result.

Mr. THOMPSON. But in the majority of instances you believe that the terms found by the public board were adopted?

Mr. KING. I would not be quite sure of that. I am not so sure but in the majority of instances the settlement was less favorable to the party that refused to accept it than it would have been had they accepted the finding of the board at the time.

Mr. THOMPSON. Are there any sections in the act which make a dispute or a strike or a lockout an illegal strike or lockout, and what are those sections?

Mr. KING. There is a section in the act which makes it an offense for a strike to take place or a lockout to be declared prior to an investigation by the board, or pending an inquiry by the board; but the strike or lockout is not made an offense per se; it is only providing that it takes place prior to the investigation. There is a penalty—I am sorry to say I do not remember the exact amount of money—something like \$10 a day for individuals and a thousand dollars a day for the company that violates that provision. I have got copies of the act with me that I could give to the commission if desired.

Mr. THOMPSON. I think we have copies of the act. Has that penalty, so far as you know, ever been enforced, either against employers or corporations or companies?

Mr. KING. There are one or two instances where it is possible—one case I know of in the Cobalt mines, where it was enforced against a man. There was another case in a coal company in Alberta, where it was enforced against a company. There are other cases where it has been violated and nobody has proceeded against the parties.

Mr. THOMPSON. In the Alberta case were you able to collect? That was against the company?

Mr. KING. That was against the company and we were able to collect.

Mr. THOMPSON. And in the other case it was against a man?

Mr. KING. Yes.

Mr. THOMPSON. Were you able to enforce that?

Mr. KING. I think so, if I remember correctly. There was an appeal from the decision of the court that made the finding, and that appeal was sustained by the court, and I think I am correct in saying that the fine was collected.

But I would like to say this: The Government has never laid particular stress upon the penalty end of it; the penalty part of it has always been treated much in the same light as a penalty for trespass. If the party affected wishes to enter an action to recover damages, they may do so, but the Government of its own initiative has never laid an information against any of the parties for

violating the provisions of the act. What has been felt by the administration is that the merits of the act lie primarily in the way of investigation which will appeal to the parties themselves, and it has not been found necessary to take action in the way of penalizing the parties particularly.

Mr. THOMPSON. Has there been any consensus of opinion on behalf of employers against that penalty section, if you know, or any general opinion held by the majority?

Mr. KING. Well, at the time the measure was being introduced in Parliament there was some objection, I think, raised, but I do not know that the penalty end of it has attracted a great deal of attention one way or the other.

Mr. THOMPSON. What would you say in reference to the labor unions? Have they evinced any antagonism toward that section?

Mr. KING. I think they would prefer not to have that section; I might say in regard to that at the time the law was enacted, we were pretty much in this position, that each party, or rather, the parties in whose interests it was enacted, had to consider whether they were prepared to make some concession to the State, or the State make some concession to them.

I spoke a moment ago about the Alberta strike. I remember at the time dealing with that. The men there were very much incensed at the company, being unwilling to meet them, and they were equally provoked at the inability to get at the facts when we were working on them, and I said to them, when we were discussing the matter, that if we could not get this information that we were after or get this meeting we were trying to bring about in a voluntary way I would get legislation through Parliament to compel it if they would back me up on it, and they were highly agreeable to that point of view at that time.

I took the matter up with some of the officers of the Canadian Federation of Labor, and they saw clearly that we were practically in this position—to get an act through Parliament which would compel employers to produce their books before a tribunal on which labor itself was represented; labor had to be prepared to do something on its behalf which the State would recognize as a concession on its part, and the compromise, if I might so call it, that was made was this: That labor agreed—I am speaking now in general terms—to postpone the time at which they would disturb the general community through a strike on condition that the State would provide them another means of avoiding the strike at the expense of the State itself, and the bill in that way, being introduced with that understanding, did not meet with the opposition of the labor organizations at the time, with the exception, I think, of some of the miners' unions, but the leading officers in the labor organizations at that time were not opposed to it.

Mr. THOMPSON. Then, as a matter of fact, the incorporation of that section into the act was at the instance of the workmen?

Mr. KING. No; not the incorporation of the section imposing a penalty. No; if anything, that was at the instance of the Government, looking at the problem of getting that legislation through Parliament. The question was this: We knew that as soon as the measure was brought down that at once the employers would say and the public would say, "You are setting up a tribunal at the expense of the State, giving rights that have never been given to labor before, namely, the right to have their own member on a board, the right to choose a chairman, the right to call witnesses and to have those witnesses paid for by the State, the right to appear for themselves, or by their own representatives. You do all this at the expense of the State. What is the State getting in return for it?" The government of the day did not think the measure could be put through unless there was some answer to that question. The answer was this: "What you get in return is the continuous operation of the utility that is concerned," and the only way that could be put in words before the public was to impose a penalty which would be collectible in the event a violation of that took place. That is the nature of the understanding, so to speak, between the State and one of the parties to an industrial dispute.

Mr. THOMPSON. You say, in the first instance, labor did not oppose the act?

Mr. KING. No; the Trades' Labor Congress of the Dominion indorsed it, and think they have indorsed it rightly.

Mr. THOMPSON. What is the attitude, if any, of organized labor toward that section of the act to-day?

Mr. KING. I think organized labor would prefer to have the act as it is without any penalty undoubtedly, but I think if they were asked—particu-

larly the unions that had been under this act—in fact, I am quite sure when I speak of the unions under the act—whether they would rather have the condition as it existed prior to this measure, namely, where they had to fight with each other and had no means of holding an investigation at the public expense or having this measure with the penalties attached to it they would say, “Give us the measure with the penalties attached to it.” In other words, there has been no agitation for a repeal of the act since it was passed. Another government is in office at the present time, and I think if they thought it was desirable to have the act repealed or changed there would probably have been an effort to repeal or change it, but they have not done so.

Mr. THOMPSON. Is there any other method proposed or have you in mind any other or better method of handling that phase of the subject than the provisions of this act?

Mr. KING. That is the best method I know of.

Mr. THOMPSON. You think it has worked out satisfactorily?

Mr. KING. I think it has more than justified itself; yes.

Mr. THOMPSON. What advantage has been taken of the provisions of the act with reference to providing for conciliation and mediation of industrial disputes which do not come within the exact purview of the act; for instance, public utilities?

Mr. KING. There is a clause in the act which provides that any industry may, upon joint application of the parties, come under this measure itself. I think the men in the boot and shoe trade in Quebec, at least a company and its employes there, and one or two cotton industries in Quebec, have taken advantage of that section and have had an adjustment of their differences under the provision. With the exception of that there has not been advantage taken of it.

Mr. THOMPSON. From your experience with the act, as it has worked in connection with the industries covered, have you any opinion as to the advisability of extending the act further than just to public utilities disputes?

Mr. KING. It is a matter there of administration. I should think it was a desirable thing, if the act were to be extended, that it should be extended by the provincial governments rather than by the Federal Government, because I think where you have all the industries of the country to deal with and only the one central Government, it would be very difficult of administration there. I see no reason why the individual Provinces, or what would be individual States here, might not enact similar measures and make them applicable to all industries over a certain number of men. I do not think the State ought to bother about anything that is not going to affect it particularly. But if the industries employ enough men so that a strike or lockout of that particular industry would affect others, then I think there is a strong reason why the State should take some measure or seek to take some measure to prevent industrial unrest, if it is possible to do so.

Mr. THOMPSON. What is your objection to that act being a Federal act?

Mr. KING. I have no objection to the present measure being a Federal one. As I say, it is simply a question of administration.

Mr. THOMPSON. I mean, what is your objection more in detail as to a further act dealing with industrial disputes being a Federal one rather than a State one?

Mr. KING. It is just a matter of the administration of the law. For example, take a dispute arising in the Province of British Columbia. Where it is a dispute affecting a street railway or some large industrial concern, the Federal Government can handle it quite readily at that long range. A few telegrams back and forth enable the choice of men to be made for the board, the choice of a chairman, and the sending of documents that are necessary, and the like. But if you extend it so the building trades are under it, then you would have disputes in some little town for instance, and it would be very difficult for the Federal Government to find out quickly enough whether the number of men involved was such as to bring it under the act, or to get the necessary appointments made, and the like; whereas a State government, with its capital right within a few miles of where the dispute might take place, could deal very readily with any situation in that area.

Mr. THOMPSON. In saying you believe it could be better handled by the State government, you probably assume that each State would enact the same kind of legislation?

Mr. KING. That is my idea; yes. For efficient administration in regard to industries other than those in the nature of public utilities, it seems to me

that legislation of that kind can be more efficiently administered by a smaller body than by one having administration over a great area.

Mr. THOMPSON. Has there been, so far as you know, much legislation by the various States of the Dominion along this line?

Mr. KING. No; there has not.

Mr. THOMPSON. What you say in that regard is based really upon your opinion as to the administrative disabilities of a Federal act?

Mr. KING. Yes.

Mr. THOMPSON. You have not considered the matter from the standpoint of the greater weight of the national act over, perhaps, the weight of a State act, and the influence on the minds of the consenting parties?

Mr. KING. No; I was thinking of it purely from an administrative point of view.

Mr. THOMPSON. If, in your opinion, the administration of a State act lacks that force of public opinion that the national act would have, then would that outweigh the administrative objection?

Mr. KING. Yes; I think it would, and I think an extension could be made by the Federal Government if enough care were taken as to indicating the extent of the dispute which would be intervened in. For example, a dispute of the building trades that would involve a thousand men, I should say was something that possibly the Federal Government might be justified in placing within the act which it is bound to administer, but if it were a dispute affecting 100 men I think it would be too small an affair for the Federal Government.

Mr. THOMPSON. Your idea is that there should be limitation with reference to the magnitude of the industrial dispute?

Mr. KING. Practically in the effect on the community, or its lack of effect.

Mr. THOMPSON. Is the present machinery adequate for carrying out the act?

Mr. KING. I think so; yes.

Mr. THOMPSON. I understand, Mr. Chairman, you have some questions to ask. I have nothing further at this time.

The ACTING CHAIRMAN. Have you any questions, Mr. Barnett?

Mr. BARNETT. No; I believe not.

The ACTING CHAIRMAN. Mr. King, I will advise you and the other gentlemen who will be witnesses that you will be asked to remain, if you can, and make such rebuttal as you choose, and also to answer questions which the commissioners by that time may have framed up for you and the other gentlemen. We thank you for your statement, Mr. King. Unless you have something further to state at this point, you will have an opportunity later if you should like to follow it out.

Mr. KING. Thank you, Mr. Chairman.

TESTIMONY OF MR. SAMUEL GOMPERS.

Mr. THOMPSON. Not for our information, Mr. Gompers, but for the information of the record, I would like to have you state your name and position.

Mr. GOMPERS. Samuel Gompers; president of the American Federation of Labor.

Mr. THOMPSON. You have occupied that position for a number of years, Mr. Gompers, have you not?

Mr. GOMPERS. I have.

Mr. THOMPSON. Will you state, just for the record, how long?

Mr. GOMPERS. About 28 years or 29 years; that is, there was a year intervening when I was not its president. That was in 1894 and 1895.

Mr. THOMPSON. Was that a vacation year?

Mr. GOMPERS. No, sir; I have not been so fortunate as to enjoy a vacation.

Mr. THOMPSON. The Federation of Labor, Mr. Gompers, is a federation of a large number of trade-unions of this country?

Mr. GOMPERS. Yes, sir; that is, of the North American Continent. That includes the United States, Canada, Porto Rico, and part of the Philippine Islands.

Mr. THOMPSON. In the membership of the American Federation of Labor there is a very large percentage, is there not, of the organized labor of this country?

Mr. GOMPERS. Yes, sir.

Mr. THOMPSON. Have you any knowledge of about what the percentage is, in a general way?

Mr. GOMPERS. I think I could tell you better in figures than in percentages. Of course, you understand that the membership in the American Federation of Labor is in the unit of organizations, rather than of individuals. It is a federation of organizations of trade-unions, and the organizations pay their per capita tax for their respective memberships to the American Federation of Labor; and, in round numbers, the payments within this past few months have been upon 2,100,000 members; that is the paid membership.

Mr. THOMPSON. Is there any concise statement you would like to make, Mr. Gompers, with reference to the purposes of the organization and its powers, as introductory to the general subject of the day?

Mr. GOMPERS. The general purpose of the American Federation of Labor is to improve the condition of the working people materially, economically, politically, socially; to secure better industrial conditions for all the workers, better wages, and shorter or normal workday; better working conditions for safety, for sanitation; better homes; better lives for the workers in their homes and in their daily life; to secure for the children safety from exploitation from employers; to give them the opportunity for the development of a fuller life and understanding; and for their better opportunities; and, in a word, to make life the better worth living after all.

Mr. THOMPSON. In your position as president of the American Federation of Labor, Mr. Gompers, have you come in contact with the subject of collective bargaining or trade agreements or conciliation and arbitration?

Mr. GOMPERS. Yes, sir.

Mr. THOMPSON. From that contact do you believe that the worker can fare better by individual bargaining than by collective bargaining?

Mr. GOMPERS. No, sir.

Mr. THOMPSON. Then, from your standpoint and from your experience, if it were stated here that a man could fare better by individual bargaining than he could by collective bargaining, such a statement was a mistake?

Mr. GOMPERS. It is at variance with every fact in the history of industry of three decades, at least.

Mr. THOMPSON. In regard to your knowledge in that respect, Mr. Gompers, do you draw it solely from the experience here, or have you a general knowledge of the subject in the civilized world generally?

Mr. GOMPERS. I have it from my own experience as a wage earner for 26 years, working at my trade as a wage earner; it is the result of my observation and close contact in the United States and Canada with the subject, and it is the result of information obtained at first hand in several other countries.

Mr. THOMPSON. Mr. Gompers, will you tell us your views of the advantage of collective bargaining to the employees—in your own way?

Mr. GOMPERS. To give anything like an intelligent answer to that question it is necessary to call attention to the industrial conditions, the industrial development of the last half century. I need not enter into very much detail and will not; but, if I may be permitted, I would like to preface my answer by saying this: For many years, that is to say, the last 50 years, and accentuated in the last 30 years, there has been going on a great development in industry and a concentration of industry under the directions of partnerships and companies and corporations and trusts, so that, in many of the great basic industries, they are under the control and direction of a few persons or companies. Then, in addition, the development of the industry in the form of newer devices, implements, tools, machines, and so on, has caused the industries to become divided and subdivided and specialized. That is, the division and subdivision and the specialization of many of these large basic industries has gone on to the extent that we seldom find one man being a practical mechanic who has the mastery in the production of any one given whole article. That is, further, that the division and subdivision has gone on to such an extent that the worker does one particular small, comparatively insignificant thing, a part of the whole article; he does nothing but that a thousand times, five thousand times, ten thousand times, or more times, over and over again, and does nothing else and knows nothing else of any other branch or of the many branches in that industry, and each making the individual small part of the given whole article, has lost his industrial importance; he has lost his individuality. He is only a cog in the industrial wheel of a modern plant.

As a consequence of these two things, concentration of industry and the division and specialization and subdivision and specialization of the trades, the workman now no longer owns the tools which the workman of old possessed and with which the worker of old performed his labor. He has nothing

to offer but his power to labor, and is bereft of the tools, the means with which he can perform that labor, except in the modern industrial plant. To say that an individual workman can make a better bargain in such an industrial plant is to beg the question and is flying in the face of obvious facts. We might take any one of the great industrial concerns of our country, and I do not know that anyone will typify the condition better than the United States Steel Corporation. To say, for instance, that an individual workman can make a bargain for his labor power, for his employment, with the United States Steel Corporation better than can an organization of workmen—that is, workmen associated and in agreement making an effort to reach a collective bargain for the labor of themselves and in association—is obviously a mistake. I am trying to put it mildly. It is a mistake, if it is not prompted by ulterior motives, to exercise the full power which wealth gives to its possessor over those who have nothing and own nothing but their power to work, to give service.

Mr. THOMPSON. We have up for consideration the question of conciliation and arbitration in the settlement of industrial disputes. With reference to that subject, or those subjects, what opinion have you and what do you wish to say to the commission?

Mr. GOMPERS. The policy of conciliation is worthy and commendable. The policy of mediation is good. So is that of arbitration. I happen to count myself rather happy in my own frame of mind, though I have been frequently placed in the rather unfortunate position of combatting—of feeling myself necessarily impelled to combat—various theories of various men having their own notions as to how this great problem of the relations between workmen and employers can be met and treated and solved.

I have said—and if I could find words to more strongly state my view I would, but I do not find them and perhaps do not know them—that speaking not only for the American Federation of Labor, whom I have the honor in part to represent, but speaking for myself, I stand for conciliation and for mediation and for arbitration. I can not agree with all forms of suggested methods of either of these propositions.

The things best calculated to bring about most practical results with the least injury, the least permanent injury, to fundamental rights and principles, are those which come from the organization of the working people. It is not difficult to secure by voluntary action on the part of either a policy of conciliation or mediation, and finally, if all other things fail, arbitration, when workmen are fairly well organized, and the better they are organized the readier do mediation, conciliation, and arbitration follow. The question of arbitration is one which must, of course, commend itself of all right-thinking persons who have the welfare of their fellows at heart; but many suggestions have been made as to the form in which arbitration shall find its expression, and we are so prone to try and avoid any present or immediate discomfort or inconvenience that many of us are likely to resort to almost any device that seems to indicate a way out of that immediate inconvenience or discomfort, and that, too, regardless of subsequent consequences. I think that it might be likened to the individual who, suffering some severe pain, locates the pain and would, following the bent of his own misunderstanding, apply something radical to it in the hope of securing immediate relief, regardless of the physical danger and vital danger which he may inflict upon himself.

I make this statement with the fact in mind that we saw a few years ago in New Zealand an effort made to abolish strikes, and a man of the finest type and caliber, a high-minded man, who after making an investigation which was as he thought sufficient to warrant him to write a book, describing New Zealand as the country without strikes. A little later a gentleman came from New Zealand to convert the people of the United States to the theory of compulsory arbitration, to recommend to us the adoption of the principle of compulsory arbitration as it obtained in New Zealand, and I have the unhappy faculty of at times saying things which displease, and upon the occasion of that gentleman's visit to the United States I did so, and declared that the American working people would never, if I read their character correctly—and I thought I did and I now think that I do—tolerate such a thing in the United States as compulsory arbitration, with all that that implies.

The book of the late Henry D. Lloyd, *A Country Without Strikes*, and the lectures of Mr. Lusk, the gentleman from New Zealand, made quite an impression, so much so that in the Congress of the United States, and in special legislatures bills were introduced providing for compulsory arbitration of industrial disputes, and perhaps for a few years the men and women engaged in our

movement were as busy as they could be, engaged in an effort to disclose the real meaning of compulsory arbitration, and as finally succeeding that better understanding among employers generally, among workmen, among publicists and among our legislators, that compulsory arbitration, no matter if it might be good in another country, it was not fit for the conditions and institutions of the United States.

It was somewhat a sort of regrettable satisfaction to me to find about 10 years later, when upon the second visit of Mr. Lusk to the United States, he declared that the law of New Zealand had not worked out as satisfactorily as he and others who favored it supposed it would, and that he did not feel that such a law would be applicable in the United States; that we were not ready for it. I agreed with him, and I agree with him now, that we were not ready for it and are not ready for it, and if my opinion is worth anything, we shall never be ready for any system of legislation which confiscates the property and enslaves the working people.

I am not here called upon, I suppose, to defend the rights of property. Those who have property may find their own way of protecting it. I am speaking for those who work, the great mass of the people of our country, and I speak for some perhaps who would not have me speak for them, but I will speak for them nevertheless.

The difference between a freeman and a slave is the right of the freeman to dispose of himself, his personality, his labor, his power to work, as he himself may determine; his own wish, his own whim, his own interest, and not be subject either to the dominating will of an employer on the one hand or the Government of the country on the other; or, I ought to have said, probably, his own will, backed up by the power of Government.

As soon as the Government steps in and says to the workingman or the working men and women "You must work under such conditions as are here stipulated; if you do not work you will go to prison." At that moment slavery has been introduced. A system of compulsory arbitration, or a system of compulsory investigation, as it obtains in Canada, wherein and whereby workers are given the choice of continuing to labor, enforced compulsory service for any given period, when the worker regards it as his interests and his rights to leave that employment, call it by whatever name you please, compulsory arbitration or compulsory investigation, compulsory work, pending the final determination of that investigation, the system of slavery has been established, and I doubt that the workmen of the United States will ever be ready to accept legislation of that character without a protest.

It may be interesting to call attention to a feature or two as the result of the compulsory arbitration act of New Zealand. The popular opinion has it that it favors the organization of the working people, and that really it has encouraged it; that the awards have come as the result of the organization of workers and employers meeting before the arbitration boards or courts. The fact of the matter is that a new device, which the employers of New Zealand have gotten up, following the practice of our own sweet-scented National Association of Manufacturers of the United States, they have gotten a few of their satraps, a few of their own agents, and had them at work in some industry for a while—no matter how little they did, or how poorly they performed any work—and then had them form a union, and, under the law, as soon as there were enough of them, which was 15—they could organize a union, and between that union or such a union and the employers—the employers' association—arbitrations, investigations, and awards were conducted and rendered. In one instance, a large body of workers organized in a bona fide union, having an existence of more than 22 years, finding that that was the method which the employers had devised to have the court of arbitration give an award—binding upon all in the trade—the men in the bona fide union just simply became members of this fake concern, and then endeavored to appear before this court, but they were denied the right.

Mr. THOMPSON. In reference to the exercise of governmental authority in industrial disputes, what opinion have you with reference to the establishment of a Government body that would have the right to investigate, the power to call for the production of documents, and the swearing of witnesses, in order that the truth may be ascertained in the dispute, where there was no suspension of the right to strike or the right to lockout?

Mr. GOMPERS. The question is of its practicability, rather than its effect. Always bear this in mind, that strikes, in the largest number of cases, consist of those unorganized or the newly organized. As workmen and workwomen

remain organized for any considerable time, strikes diminish. They establish for themselves and with their employers means and methods of conciliation, of arbitration, and it is only when those absolutely fail that there is a stoppage and break in their relations. After all, that which we call a strike is nothing more nor less than an interruption of the former relations which exist between the workmen and the employers for the purpose of arriving at a new working agreement. In cases where the workers are well or fairly well organized, the facts are known to the employers and the employees. In the case of an unorganized or a newly organized body, they know nothing of each other's conditions, or very little, are no respectors of each other's rights, and the methods by which the workers could establish the facts are exceedingly meager. Investigations authorized by the State could establish but very little in so far as the relations between the employers and the employees are concerned.

Mr. THOMPSON. But would not it be possible for such a body—with that power of investigation—to ascertain the facts and probably be able to help both of the parties to arrive at a remedy where the dispute involved matters of fact?

Mr. GOMPERS. Generally, they are not matters of fact. They are matters of mental attitude, the mental attitude of the employers, who consider that the workmen have no rights that they as employers are bound to respect, and the failure on the part of the workmen to demonstrate that they have some power to diminish the profits of the employer by a cessation of their work. It is not a question of facts. The facts are these: When an employer has a mass of unorganized working people working for him he is master of all he surveys, and any attempt upon the part of the workmen to petition or request a change is looked upon by him as a rebellion. It is an insult to his position and to his dignity, because he, in his mind, has furnished them with work and with the means by which they live. He is perturbed at the idea that his position as their benefactor has been called into question. On the other hand, the workmen, who have been docile all this time, who have regarded the employer as omnipotent and all powerful, when they finally revolt in desperation against that one-sided arrangement, when they are for a while—possibly a short while—out, they imagine themselves all powerful, and the employer as having no power at all. It is a question of a struggle—that is, a struggle of the workers to still remain idle without doing anything and to subsist. If these working people remain organized at the the end of the controversy—whether they return by agreement or return with a victory or return with a defeat—if they retain their organization thereafter it was not a defeat, it was simply a retreat, and it will impress itself upon the employer in the very near future thereafter to establish better relations between them, where each will have a better understanding of the position of the other, and it will lead to an arrangement of recognition, understanding, and collective bargaining.

As to the investigation conducted by the State, while I can not see why there would be any objection where there would be no factors connected with it that would be of a compulsory character on either, my apprehension is this, Mr. Thompson, that once you place in the hands of the State this one feature, then you will have laid the basis for a continual effort which leads to compulsory arbitration. There is a constant effort on the part of so many people—and some are candid enough to admit that there is a constant effort—to tie the working people to their task, to tie them to their labor, to rivet them to their labor, that they can not quit and stop. I am in happy mental companionship with the great Lincoln when he said the great factor of American life and liberty is that there is a place where the working people could stop.

Mr. THOMPSON. Mr. Gompers, does your objection to compulsory arbitration and to the establishment of an institution for the purpose of investigation even, extend also to the establishment of a State body that could be appealed to for the purpose of mediation and conciliation?

Mr. GOMPERS. I think not. The chief objection I may have is that of apprehension as to the future, not of its immediate effect. I know of but very few instances in which there were any large contests between employers and employees involving public comfort, public safety, public convenience, where some means was not devised immediately, improvised, by which the parties were brought together and some sort of agreement reached.

Mr. THOMPSON. With reference, Mr. Gompers, to the forms of arbitration and conciliation which are voluntarily entered into by the parties under their trade

agreement, have you any choice as between those boards of arbitration which are evenly divided between the two contending parties, and those boards which provide for the selection, either immediately of an umpire or third party, or which make provision for his selection in the end in case the parties are unable to agree?

Mr. GOMPERS. My preference is for a board of arbitration, where arbitration is the last resort, where the representatives of both parties are evenly divided. As to the umpire or odd man, perhaps it would be just as well if the contending parties decided that after all they could not agree and they would toss up a coin.

Mr. THOMPSON. Take a trade, Mr. Gompers, in which disputes of necessity, you might say, are almost constantly arising, arising daily, and where perhaps a third man might be taken on more or less for a stated space of time, where he would become acquainted perhaps as well, in so far as the question of arbitration is concerned, better than those who are toiling in the trades, or who are operating the business; do you think in that case or cases of that kind the introduction of such an umpire, who would operate perhaps as a mediator, would be no better than the tossing up of a coin?

Mr. GOMPERS. Having had the very exceptional pleasure of my acquaintance with you, Mr. Thompson, if you or men of your type were umpires I should say immediately, Amen! But I have had experience with other men who are not Thompsons. The difficulty is to get one who is known as an impartial man, who is impartial absolutely, who is not influenced by his youth, his experience, his environment. I realize that it is the accepted best thought to leave the result to a fifth or seventh or ninth man, but after all there is a great responsibility upon this supposed impartial man who can not be impartial entirely. I know I have been called in as umpire or arbitrator in disputes between workmen and employers, in spite of the fact that my life has been inclined with the women and men of labor, the employer feeling his contention was so just, and I have had to say what I say freely now, that if I acted as an umpire in such a case I am free to confess in advance that 50 per cent of my sympathy goes to the workmen in their contention, so that it would have to be a pretty strong case on the part of the employer before I could give any sort of an award for him or offer some sort of compromise. I think that if the workmen and employers, organized and having their agreements, their collective bargaining, knew that upon themselves depended the reaching of an agreement or the breaking of an agreement with all that that involved, they might more easily come to an understanding and reach an agreement without the umpire. But inasmuch as they have to resort to the umpire, they relieve themselves from the responsibility and place it upon this third or fifth or seventh man.

Mr. THOMPSON. For instance, Mr. Gompers, take it in a trade or industry where there are frequently arising questions in an open shop or preferential shop, where a man makes claim that he is discriminated against or discharged because of his union affiliation, or that because of their union affiliations they were getting a poorer class of work to do and a poor place to work in the factory, or in some one of the many methods of discrimination they were unfairly treated, such questions require more or less of an immediate consideration. Usually those complaints come from the employee in his own particular instance, so far as the organization is concerned a small matter. In such cases as that, do you believe that a resort to a board of arbitration of a committee on adjustment, providing for the steady employment of a third man, is practicable and would be a profitable scheme?

Mr. GOMPERS. I should say yes, but I think that it might just as well be one man chosen to do that, agreed to by both parties. The other two are entirely superfluous appendages.

Mr. THOMPSON. But suppose in that sort of a case the main effort of the third party is to make suggestions and to endeavor primarily to bring the other two together, to prevent them from differing, to suggest methods of abridging their differences, and by that method really to get them to decide by far the larger proportion of the cases—if this method could be worked in spirit, in your opinion would that make a machinery still better?

Mr. GOMPERS. It would. I trust you will pardon me when I say that I have not come across many Thompsons. That is all there is to it.

The ACTING CHAIRMAN. We had a Mr. Williams here with us this morning. Do you know him? Have you come across Mr. Williams?

Mr. GOMPERS. I have not seen him. I have heard of him, but I do not know him. I may be well acquainted with him, but have the misfortune not now to recall him.

The ACTING CHAIRMAN. The man I refer to was in the Hart, Schaffner & Marx matter.

Mr. GOMPERS. Yes, I know who he is, but I do not recall having met him.

Mr. THOMPSON. You say there is a place for the use of such men, and that their use would be valuable in the working out of the immediate and temporary troubles that arise in industrial life?

Mr. GOMPERS. But it requires a man so deeply in sympathy with the real, earnest, honest aspirations of the working people; it requires a man who has the experience and the knowledge of the situation of the employers; it requires a man who is in sympathy with the honest, earnest organized labor movement, that among public men I am free to say I have met but very few who meet those requirements.

Mr. THOMPSON. In your opinion, Mr. Gompers, in the making of collective bargains, is it also well, in addition to the thorough and strong organization of the employees, that the employers should also be well organized?

Mr. GOMPERS. Yes, sir; to make the most effective collective bargain.

Mr. THOMPSON. If the commission please, that is all I care to ask.

The ACTING CHAIRMAN. Mr. Barnett?

Mr. BARNETT. No questions, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Gompers, if you will retire now, we will hear from Mr. Emery, and then hear further from yourself and Mr. King afterwards.

TESTIMONY OF MR. JAMES A. EMERY.

Mr. THOMPSON. Mr. Emery, for the purpose of the record will you please give your name, residence, and occupation?

Mr. EMERY. James A. Emery, Washington, D. C., attorney at law.

Mr. THOMPSON. I believe you are connected with the National Association of Manufacturers?

Mr. EMERY. I am.

Mr. THOMPSON. In what capacity?

Mr. EMERY. I am counsel for them and also for a number of other industrial organizations.

Mr. THOMPSON. For what other organizations, Mr. Emery?

Mr. EMERY. I can not enumerate them all—some 260.

Mr. THOMPSON. They are also employers' organizations?

Mr. EMERY. Probably not in the sense in which you use the word. I assume you use that word as meaning an organization composed of employers for the purpose of defense, or whose primary object is the interest of the employer in his relation with labor.

Mr. THOMPSON. Not necessarily. I meant it in the broader sense.

Mr. EMERY. Yes; the greater number are employers of labor in both instances.

Mr. THOMPSON. What is the general purpose of the National Association of Manufacturers?

Mr. EMERY. The general purpose is the promotion of the interests of the American manufacturer. Would you like some description of it?

Mr. THOMPSON. Yes.

Mr. EMERY. The National Association of Manufacturers was organized in 1895 primarily for the promotion especially of foreign trade, and as it grew in years it developed a wider range of interest for the manufacturer, and it deals to-day with practically every phase of social and industrial activity in which the manufacturer as such is interested.

It maintains its headquarters in New York and carries on an extensive foreign department. Those who might have more interest will find a very interesting account of it in the Saturday Evening Post of two weeks ago by Mr. Forest Crissey, who is writing a series of articles on trade organizations, and in that he speaks of this as the largest trade organization in the world, and he gives a most interesting account of trade organizations.

The National Association of Manufacturers provides for the shipment of freight of every kind for its members. It has a department of translations, in which the foreign correspondence of manufacturers can be carried on in some 30 languages, letters being received and translated and others written. It has some 2,100 correspondents in all the chief commercial centers of the

world, who keep it informed as to trade matters for the benefit of its members. It has a foreign collection bureau and a domestic collection bureau, and a shipping and transportation bureau. It has an extensive system of inspection for its factories. There is attached to it as a subsidiary organization a mutual fire insurance company, for the benefit of its members, and of course it informs its members as fully as it can on all questions of interest to the manufacturers. For instance, all questions which would develop in relation to the conditions under which manufacturers do business in every State in the Union, as well as in every foreign country.

The legal department attends to all the questions that necessarily arise under those circumstances. It keeps track of all legislation of the States and in the National Legislature, of interest to manufacturers. It informs them fully as to their terms and meaning. It represents them in opposition to such legislation as they oppose, and in the promotion of such legislation as they express formal interest in. There is practically no matter that would inform a manufacturer concerning conditions in the trade at home or abroad, and practically no questions of interest to the manufacturer of which it does not undertake to keep abreast.

In the last five years it has carried on a very extensive movement for accident prevention and workmen's compensation. It was the first large organization in this country to take up that work, and it made extensive foreign investigations as to the practical operation of workmen's compensation laws abroad and methods of accident prevention, and from this experience it has undertaken to apply the fruits in this country, subject to the modifications that exist in our differing forms of work. We have a standing committee in charge of that work, and a continuous inspection is going on of the factories of all our members with respect to increasing the facilities for the prevention of accident, and the inculcation of those habits which most readily and powerfully lead to accident prevention.

In addition to that, there is a very wide range of educational work carried on in connection with that and other subjects. Practically every shop of the members of the national association has been visited during the last four years by lecturers, who, through moving pictures and a form of address, have undertaken to enlist the cooperation of both employers and employees in the movement for accident prevention and vocational education. We have spent very large sums of money in that work, and have a very large staff carrying it on, and the films which have been made for the purpose of strikingly depicting these efforts and principles to the eye have not only been used among the employees or members of the association, but they have been generally at the service of public bodies of any kind or character in any part of the country that were interested in the subject, and those lectures on those subjects have been carried on before commercial and manufacturers' associations in every part of the country.

Mr. THOMPSON. I presume that among these activities you mention the relation of employer and employee have received the attention of the National Association of Manufacturers?

Mr. EMERY. Very decided attention; in the last 10 years, notably. Much attention was not paid to that at first, but it became more and more a subject of discussion in conventions and meetings, and from 1903 or 1904 it may be said to have been one of the dominant questions in the life of the national association, and the association has expressed itself very vigorously with regard to the principles which it believes ought to underlie the relations of employer and employee, and has undertaken by every legitimate means to defend those principles against attack.

Mr. THOMPSON. In your position as attorney for the association, have you had much to do with what is called the labor problem?

Mr. EMERY. Yes; I have. I have been, I hope, a very constant student of it. I have had a very keen interest in it, and I have endeavored, so far as I could, to study every feature of it that came within the limits of my observational experience.

Mr. THOMPSON. Has the National Association of Manufacturers laid down any rules with reference to the subject of collective bargaining?

Mr. EMERY. No; it has not. It has been a frequent subject of discussions in various conventions, and on various occasions; but the National Association of Manufacturers is not an organization for the purpose of representing its members in their dealings with labor, organized or unorganized. It has nothing to do with the making of their individual relationships with their employees, but

It has expressed its opinions upon those subjects, and its general conclusions have been stated in the form of certain principles which were adopted in 1903, and which bear upon that as upon all other features of the relationship between employer and employee. If you should like it, I should be very glad to read those principles.

Mr. THOMPSON. I should be pleased to have you do so.

Mr. EMERY. These principles were adopted at New Orleans in 1903, and have been reaffirmed at many subsequent conventions of the National Association of Manufacturers, and fairly express the general opinion of the association on what may be termed, generally speaking, the relations of employer and employee, apart from merely legal questions.

These principles are as follows:

PRINCIPLES AND PLATFORM ADOPTED AT THE NEW ORLEANS CONVENTION OF THE NATIONAL ASSOCIATION OF MANUFACTURERS IN 1903.

1. Fair dealing is the fundamental and basic principle on which relations between employees and employers should rest.

2. The National Association of Manufacturers is not opposed to organizations of labor, as such, but it is unalterably opposed to boycotts, blacklists, and other illegal acts of interference with the personal liberty of employer or employee.

3. No person should be refused employment or in any way be discriminated against on account of membership or nonmembership in any labor organization, and there should be no discrimination against or interference with any employee who is not a member of a labor organization by members of such organization.

4. With due regard to contracts, it is the right of the employee to leave his employment whenever he sees fit, and it is the right of the employer to discharge any employee when he sees fit.

5. Employers must be free to employ their work people at wages mutually satisfactory without interference or dictation on the part of individuals or organizations not directly parties to such contracts.

6. Employers must be unmolested and unhampered in the management of their business, in determining the amount and quality of their product, and in the use of any methods or systems of pay which are just and equitable.

7. In the interest of the employees and employers of the country no limitation should be placed upon the opportunities of any person to learn any trade to which he or she may be adapted.

8. The National Association of Manufacturers disapproves absolutely of strikes and lockouts and favors an equitable adjustment of all differences between employers and employees by an amicable method that will preserve the rights of both parties.

9. The National Association of Manufacturers pledges itself to oppose any and all legislation not in accord with the foregoing declaration.

Mr. THOMPSON. Referring to paragraph 5 of this declaration of principles by the National Association of Manufacturers, which says: "Employers must be free to employ their work people at wages mutually satisfactory without interference or dictation on the part of individuals or organizations not directly parties to such contracts," what is intended or what should be understood by that declaration with reference to "organizations not directly parties to such contracts"? Would that eliminate the ordinary trade-union—

Mr. EMERY. No, sir.

Mr. THOMPSON (continuing). From a part in the making of a contract with the individual?

Mr. EMERY. No, sir.

Mr. THOMPSON. What is to be understood, then, from that language?

Mr. EMERY. I assume that they had in mind especially the interference of organizations other than the one of which the workman dealing with the particular employer was a member.

Mr. THOMPSON. Then, under that declaration, if a teamster were to be engaged by a member of the National Association of Manufacturers, and he belonged to an organization of teamsters, it would be permissible for him to deal with the employer through his organization?

Mr. EMERY. Certainly; subject to the principles there stated. Those principles are to be taken as a whole and not separated from each other.

I do not wish to be misunderstood. I mean by that that there is no opposition, so far as I know, among members of the National Association of Manufacturers, to the principle of collective bargaining. There are many members of the association who deal with their employees collectively, and the association has never at any time interfered with the action of its members in that regard, but it has opposed the making of an exclusive collective bargain which meant the establishment of what we term a closed shop.

Mr. THOMPSON. But otherwise this section 5 is not to be understood or read as preventing collective bargaining?

Mr. EMERY. Not as expressing an opinion in opposition to it; no, sir.

Mr. THOMPSON. From your study of this question of collective bargaining and from the experience you have gained in your position as counsel for the National Association of Manufacturers, do you believe that an individual can fare as well with reference to his wages, hours of labor, conditions of work, if he deals individually with the employer as he would if he should deal collectively with him?

Mr. EMERY. It depends entirely upon the size of the employer with whom he deals.

Mr. THOMPSON. I mean generally speaking.

Mr. EMERY. Generally speaking, it depends upon the quality and character of the employer and his size. To illustrate what I say, I heard Mr. Gompers's very interesting illustration here, which he presented with characteristic extremity. It is true, what he said as to the individual having little chance in making an individual bargain with the United States Steel Corporation, but it is just like talking about a plumber over on F Street here having a little shop—a small employer, who employs two or three men—dealing with the plumbers' union. The small employer is at the same disadvantage in dealing with the union. I assume that if all the employers of men in this country were taken together it would be found that the average employer employs between 5 and 10 men. I merely take those figures from estimates that I have heard made by many manufacturers, both large and small. While it seems quite true that the individual laborers would be at a decided disadvantage in dealing with a large manufacturer, it is equally true that the small employer is at a decided disadvantage in dealing with a large union; and while it is true that the individual wage earner may be both poor and somewhat weak, it is equally true that collectively he is rich and powerful, which is illustrated by the influence exerted by many large labor organizations and by the very fortunate conditions of their treasuries; and it is equally true that there are many employers of labor who are as much enmeshed by the situation in which they made their contracts as any individual laborer could be. Mr. Bradstreet tells us that about 5 per cent of the men who engage in manufacturing industries succeed. The remainder fail. So that the roadway of the manufacturer is by no means of high success and certainty.

Mr. THOMPSON. Mr. Emery, if it is true that the small employer is in the aggregate the large employer of the country, and if it is also true that the small employer is weak in dealing with the workingmen who are organized, then it would naturally follow, would it not, from the standpoint of the workingman at least, that for him to deal collectively with the employer would better his condition?

Mr. EMERY. Yes; in many cases.

Mr. THOMPSON. I mean as a general proposition?

Mr. EMERY. Well, that is an abstract question that would have to be divided probably into several considerations to admit of a positive answer, a categorical answer, at least.

Mr. THOMPSON. Would you mind dividing it?

Mr. EMERY. Certainly. I think there are a great number of workingmen in this country, and the higher you go in the scale of efficiency the more you find of them who dislike to surrender their earning power to an organization that makes its bargain for them. I think your inquiry is directed to this question, because the market for labor, particularly in skilled trades, is always under-supplied.

So far as I know, the demand for men highly skilled, men capable of filling the positions of foremen and superintendents—I am speaking of skilled labor—is never satisfied, and I know personally from many manufacturers that I have come into contact with that there is always a pressing need and demand expressed for the higher forms of skill, both in the individual work-

men and for men capable of being foremen and for leadership and for constructive purposes, and especially for the increase of efficiency of the plant generally, because the intelligent and progressive employer realizes that that is the way to secure efficiency in competition, not only within the surroundings of our own Nation, but over the face of the earth, and that it is the efficient nation who owns the markets of the world. So the desire of every employer is to cultivate by every means in his power the efficiency of his men, and I think he realizes as keenly as any element in our community possibly can the enormous opportunity that good feeling between employer and employee has in producing this necessary condition of success.

Mr. THOMPSON. Then, as I understand it, if you were an employee of the ordinary and usual industries of this country, looking for a job and seeking to do the best for yourself that you could, you would be in doubt as to whether it was advisable, in order to accomplish that purpose, to join a union or to become organized or not?

Mr. EMERY. It would not depend upon that consideration alone. Peace for myself and my family might induce me to do many things that my industrial progress would require.

Mr. THOMPSON. But taking those conditions, without any other considerations, that would be your idea?

Mr. EMERY. It would depend upon the trade I belonged to.

Mr. THOMPSON. I mean eliminating both the advantages and disadvantages that would come to you?

Mr. EMERY. Yes.

Mr. THOMPSON. Eliminate the necessity of joining a union in order to get a job.

Mr. EMERY. Yes; and I think I would be supported in that opinion by many, many millions of my intelligent and practical fellow citizens.

Mr. THOMPSON. I take it that you mean but a small percentage of the workers are organized?

Mr. EMERY. The percentage of unorganized is much greater than organized, and in view of the active missionary campaign of organized labor there must be excellent reasons for so many remaining unorganized.

Mr. THOMPSON. That rather implies, I take it, that you consider the people unorganized have seriously considered the question of organization and have the means of forming an organization, but, having that door open to them, have decided that on the whole it is best not to do so?

Mr. EMERY. That is a conclusion I naturally form from the conditions which I observe all about me.

Mr. THOMPSON. Then we are to understand, as I said before, that you have no opinion as to the merits or demerits of collective bargaining from the standpoint of the employee, no general opinion?

Mr. EMERY. On the contrary, if I were looking at the matter from the standpoint of the employee, I see many advantages in collective bargaining, a great many indeed, and I should certainly be guilty at least of having suffered a miscarriage of interpretation if I permitted you to believe that I was personally opposed to collective bargaining or that my experience was against it or that I did not recognize it to be not only of importance, but a very essential feature of our modern life in many instances.

I would say that it is very difficult—collective bargaining, without referring to it with the approval or disapproval which I would give it—depends entirely upon the principles which underlie the proposal. If you say, for instance, the form of collective bargaining that is presented in what I regard the best statement ever made upon that subject, in the report of the Anthracite Coal Commission of 1902, I would say not only for myself, but the great body of manufacturers I personally have been in contact with, they accept practically almost unreservedly the opinions there expressed and would indorse the form of collective bargaining with the principles underlying it that was so satisfactorily outlined in that place.

Mr. THOMPSON. Could you briefly state in your own language what that form is and what are the commendable features of it which you indorse?

Mr. EMERY. The most important, to my mind, is that found under the ninth finding of the commission. You will, of course, recollect that both employers and employees were represented on this commission, unorganized employers, I believe, and organized employees, in person by E. E. Clark, now of the Interstate Commerce Commission. The most important principle there stated is this:

"It is adjudged and awarded that no person shall be refused employment, or in anyway discriminated against on account of membership or nonmembership in any labor organization; that there shall be no discrimination against or interference with any employee who is not a member of any labor organization by members of such organization."

I regard that as the most important, and a most fundamentally important principle. Of course, there are no such questions arising here as to the restriction of product or restriction of apprentices; no issues of that character were presented.

On the other hand, I should hesitate very much, it seems to me, to engage in any collective bargaining in which this section was embraced as part of it, part of the governing law that was to rule. I read from the constitution and by-laws of the Glass Bottle Blowers' Association. This agreement covers the 1913-14 blast:

"A member who encourages or assists in any manner, either directly or indirectly, any foreign glass blower to come to the country shall, upon conviction, be fined not less than one hundred dollars and be suspended from work for one year."

"Clause 25. No foreign glass blower shall be admitted into the association during the blast of 1913-14. But the national president and executive board shall have power to admit such when deemed necessary, and an initiation fee of five hundred dollars (\$500) imposed; one hundred dollars (\$100) to be paid down at initiation and 50 per cent of his earnings to be paid into the association until the whole amount is paid."

Commissioner O'CONNELL. What year is that?

Mr. EMERY. 1913. The blast of 1913-14 is now in force. It would seem to me, since you have asked me as an employee, that I should somewhat hesitate to become a member of the typographical union if I were required to take this obligation, part of which reads as follows: "That my fidelity to the union and my duty to the members thereof shall be in no sense interfered with by any allegiance that I may now or may hereafter owe to any other organization, social, political or religious, secret or otherwise."

I am reading article 12, section 1. That complete clause is part of the common obligation given to members.

I simply speak of this to illustrate my answer to your inquiry as to whether I would be a member of this or that organization, and I would say that it depends entirely on the conditions attached to the membership, and to the prospect of employment. I would not be misunderstood for a minute in either questioning the necessity, propriety, and the enormous social and individual value of the organization of the workingman. What I discuss now, when you ask that question, is perhaps a criticism of features of it which seem to be intertwined with the movement among organizations, which seems to me subject for a proper criticism.

Mr. THOMPSON. Let me see if I can state your position, as I get it at least, that where the making of a collective bargain with the employer automatically incorporated into that agreement detrimental conditions or clauses such as those you have named, naturally being in your opinion a bad agreement, you would not make it?

Mr. EMERY. No.

Mr. THOMPSON. But that if an agreement to be made between the parties had no detrimental features such as those you have named, or anything similar, you would then believe in collective bargaining?

Mr. EMERY. When you say "detrimental," that may either be a question of principle or of policy. A question of policy, of course, can be readily corrected by change; a question of principle, of course—

Mr. THOMPSON. I am trying first to get at the pure question as to whether, from the standpoint of the employer, or the standpoint of the employee, collective bargaining is a good proposition to go on.

Mr. EMERY. Yes.

Mr. THOMPSON. Then, we can eliminate from that such cases of collective bargaining that we would not agree to. Do you believe in a general principle of collective bargaining between employer and employee?

Mr. EMERY. Yes; I think it an excellent thing in many cases. I think the smaller the employer the more difficult position he is in, and the larger the employer the more difficult position the individual employee would be without it.

Mr. THOMPSON. You have read from the glass blowers' constitution and by-laws. What has the introduction of a man in the glass blowers' trade, which

has made that more or less an automatic proposition, had to do—or, change the form of the question, Is it possible that the introduction of such a man had the effect of throwing or tending to throw a great many men out of employment in the glass blowers' trade?

Mr. EMERY. Yes; I have heard that.

Mr. THOMPSON. Men who have heretofore been recognized as highly skilled men and who have devoted their lives to learning their trade and becoming skilled at it; that therefore under such conditions it was necessary for the union men to protect the livelihood of themselves and their families by introducing just such clauses in the by-laws so as to take into consideration the introduction of such a machine to the world all at once would seem like restrictive conditions which were unbearable and unjust; if the introduction of those clauses was caused by the introduction of such a machine, would that mitigate your view of such clauses?

Mr. EMERY. It would not mitigate the condition of a person who did not happen to be a member of the union, and was equally under the necessity of supporting his wife and children.

Mr. THOMPSON. Do you know of any union in which the system of collective bargaining which you commend has been enforced?

Mr. EMERY. You mean in which the right of nonmembers of the organization to belong is recognized?

Mr. THOMPSON. Yes.

Mr. EMERY. A great many. Brotherhoods are, of course, the most striking examples, and there are many others. For instance, the street railways of Boston have just entered into arrangements, or have just made a collective bargain with the Amalgamated Association of Street Railway Employees, which is a member of the American Federation of Labor. The first clause in that collective agreement provides practically for a principle that is here recognized in the Anthracite Coal Strike Commission, and, of course, when I read you from that, I brought to your attention by that fact an agreement entered into which covered all the coal miners whom Mr. Mitchell so ably represented here the other day.

That principle is still recognized, although I heard Mr. Mitchell say the other day that a man was expected automatically to become a member of the union. The Amalgamated Association of Street Railway Men has just made this arrangement with the Boston Elevated, and the first provision of the agreement recognized that condition. I have here a number of agreements with stationary engineers in which that arrangement was made, and I know the members of our own association, quite a few of them, who have collective bargains in which they decline to exclusively employ the members of the union with which they deal, but in other respects recognize them as to hours, wages, and working conditions, and deal with their representatives, and in all respects treat them as the agents or authorized representatives of the men, but not as the exclusive source for their labor supply.

Mr. THOMPSON. In referring to the question of collective bargaining, I have not necessarily inferred that it must be with the union.

Mr. EMERY. Sir?

Mr. THOMPSON. In considering the question of collective bargaining, I have not implied that it must necessarily be with organized trade or craft, but rather, as a whole of the employees of the factory or employees generally in a line of industry; following that out, however, and your answer—

Mr. EMERY. Your question, if you will pardon me, was, of course, whether or not I knew any organization maintaining collective bargaining of the type to which I have alluded.

Mr. THOMPSON. Following out the last answer which you gave, or at least apropos of it, if you were a miner working in the anthracite coal region, would you be inclined to join the union because of benefits you might thereby derive—I do not mean to escape violence, but for the benefits you might derive, would you be apt to become a member of the union?

Mr. EMERY. Yes; I might.

Mr. THOMPSON. If you were a trainman, Mr. Emery, on some of the railroads where there are brotherhoods, the brotherhoods you spoke of, would you be inclined to join those organizations and deal collectively with the railroad company, or would you be inclined to remain an individual and deal individually?

Mr. EMERY. It is very difficult to answer that question from my standpoint. I might and I might not, according to the circumstances. I would take com-

plete personal responsibility for what I did. I could answer you very fully in the terms of the Anthracite Coal Strike Commission if you would like to hear it. They answered that question very completely and I think very satisfactorily, and that report was signed by Mr. Clark.

Mr. THOMPSON. I will be pleased to have it.

Mr. EMERY (reading):

"The union must not undertake to assume or to interfere with the management of the business of the employer. It should strive to make membership in it so valuable as to attract all who are eligible, but in its efforts to build itself up it must not lose sight of the fact that those who may think differently have certain rights guaranteed them by our free Government. However irritating it may be to see a man enjoy benefits to the securing of which he refuses to contribute, either morally or physically or financially, the fact that he has a right to dispose of his personal services as he chooses can not be ignored. The nonunion man assumes the whole responsibility which results from his being such, but his right and privilege of being a nonunion man are sanctioned in law and morals. The rights and privileges of nonunion men are as sacred to them as the rights and privileges of unionists. The contention that a majority of the employees in an industry, by voluntarily associating themselves in a union, acquire authority over those who do not so associate themselves is untenable."

Of course, your inquiry is naturally predicated upon the assumption implied behind your question that I might find it valuable to join the union. I might and I might not. I should insist upon the recognition of my right to pursue my own happiness and to make my living for myself and family in either case as I saw best, and I regard that as a most fundamental principle in this whole controversy.

Mr. THOMPSON. Then you have no opinion now as to whether it would be valuable to join one of the brotherhoods on the railroads or not?

Mr. EMERY. It is a question of policy, and if I were in that condition I should form my judgment in the light of the facts. I should think, under all the circumstances, I would be very strongly tempted to do it. That is purely hypothetical, like your questions.

Mr. THOMPSON. Referring to the question of conciliation and arbitration, have you given that subject any thought and consideration?

Mr. EMERY. Yes, sir.

Mr. THOMPSON. What is your opinion regarding it, and particularly with regard to the forms of arbitration. You have heard the discussion we have had here in the last several days?

Mr. EMERY. Yes.

Mr. THOMPSON. What have you to say about it?

Mr. EMERY. I regard mediation and conciliation, of course, as merely various forms of preliminary steps for getting the employer and the employee together; in other words, to remove the many irritating causes of friction and to get them into such an equitable state of mind that they are in a rational condition to understand each other's proposals and to deal with them. I think that arbitration is a very proper thing to resort to on all questions of fact and on all questions of interpretation of agreements where such exist. Naturally, I do not believe you can arbitrate principles to which each may be committed, because a principle that ought to be defended is a principle that can not be arbitrated. That is true between individuals under our form of government, because, I assume, our discussion is being conducted on the realization that we are citizens of a republic in which certain fundamental rights are recognized and ought to be recognized, since they represent the progressive development of our race through many centuries.

As to the form of arbitration, I am very strongly inclined to agree with Mr. Gompers that the parties outside of the arbitrator are superfluous, except for this reason: That I think, in all forms of arbitration in which each person chooses one and the two chooses a third, naturally the third person chosen would have to be satisfactory to those two, each of whom are really attorneys for an interest. They represent those who chose them and they are generally possessed of special information that will correct the arbitrator at every step in the course of his opinion. I thoroughly believe in the establishment of an arbitrator, because, while I heard the objections previously made here, it seemed to me such objections run to the establishment of a judicial system. It is absolutely impossible—of course, abstractly speaking—to find an individual who possesses the impartial attitude of the Divinity. All men are human, subject

to prejudice, error and bias, and "All the idols of the tribe," as Lord Bacon called them; but we do succeed in arbitrating the most important questions that the individuals are compelled to deal with, and for that reason we have a judicial system, however it may be criticized, and it has even been possible for nations to arbitrate their great difficulties; so it seems quite possible that, humanly speaking, we can find an individual with so much of the divine spark in him that he can possibly pass upon questions of difference between individuals, even in a labor controversy.

Mr. THOMPSON. Apparently you and Mr. Gompers agree on the question of arbitration, not only on the compulsory side of it but on the other side of it.

Mr. EMERY. I do not believe in compulsory arbitration, but I very strongly believe in certain forms of compulsory investigation. I believe it would be a very valuable thing if we had in this country a direct organization, of the executive, for instance, to investigate labor controversies which interfere with the movement of the mails, with the movement of the civil or military forces of the United States, or which interfere with the freedom of intercourse between the States. There could be no question of jurisdiction to make such an inquiry, and when controversies assume such magnitude that they do interfere with those important relationships, they are touched with a public interest which affects the life of the Nation. The development of our material civilization has made our communities more and more interdependent. You can starve New York to death in three days. You can shut off communication with any of the great centers of population in this country and reduce them to a state of subjection equal to the result of a prolonged siege. They are unprepared for it, because the development of large cities, and the specialization of our industries have led to communities with rapid means of communication and transportation that depend upon far distant points for their daily supply of food, clothing, etc., and for all their raw materials upon which the great productive industries are dependent. To keep these going is essential to the maintenance of the whole civil structure, and of all forms of material production upon which the whole life of this Nation is dependent. When any controversy assumes a magnitude that it interferes with these, the safety of the public demands that protection should be given to the maintenance of that intercourse. Of course, under the laws as they exist we have perhaps an adequate protection against forms of assault which have not become through, I think, improper consideration, more or less privileged.

Mr. THOMPSON. Are you acquainted with the Canadian industrial disputes act of 1907?

Mr. EMERY. Generally; yes, sir.

Mr. THOMPSON. Would you be in favor of such an act in this country?

Mr. EMERY. No; I would not. There is, of course, a difference in our fundamental organic law which raises objections which seem to me insuperable on the one hand, and I do not think the Canadian act can be enforced as it reads, and I think those who administer it realize it most keenly of all. It has undoubtedly, practically speaking, brought about many good results in Canada, because it has, by the very nature of the penalties which it imposes, acted as a preventive, inasmuch as it excited the minds of both employer and employee to a realization of the high value put upon their relationship by the State. But I think that what Burke said a century ago applies almost equally well to-day. You could not indict the Nation then. You can not imprison a union of employers or employees.

Mr. THOMPSON. If the commission please, that is all I care to ask Mr. Emery.

The ACTING CHAIRMAN. Mr. Emery, will you allow us to call Mr. King and Mr. Gompers again, and then we would like to recall you for further questions which the commissioners desire to ask?

Mr. EMERY. Certainly.

The ACTING CHAIRMAN. If so we will hear from Mr. King again at this time.

TESTIMONY OF HON. W. L. MACKENZIE KING—Recalled.

The ACTING CHAIRMAN. Mr. King, there were doubtless some remarks which you would like to either criticize or rebut, in the statement of either Mr. Gompers or Mr. Emery.

Mr. KING. I would like to say, first of all, that I agree wholly with Mr. Gompers, and I think also with Mr. Emery, in saying that I am very strongly opposed to compulsory arbitration. I do not think that any group of men, either employers or employees, should be compelled under penalties to continue under

a certain condition of employment against their own free will, and what they conceive to be their interests. On the other hand, I think that Mr. Gompers, in linking compulsory arbitration and compulsory investigation together, if he did so—I am not quite sure whether he did or not, but I infer from his remarks that he did—is not aware that such a linking may be misleading.

As I regard compulsory arbitration, it is a means of compelling people to continue employment under certain conditions whether they wish to or not. Compulsory investigation, as proposed by the Canadian act, does not do anything of the kind, as far as I am able to see it. All that compulsory investigation does under the Canadian act is to substitute another means of obtaining justice than that of the strike. If I am right in the interpretation of the motive that working men have in striking, it is that they conceive that is the last resort left to them to obtain what they believe to be justice. Mr. Gompers says it is slavery for a man to have to give up certain rights. It seems to me it is slavery for any body of men to be compelled to give up the right of earning their own living in order to obtain justice if the State can find any means of affording them justice other than that extreme measure. I think that such a means has been found in compulsory investigation.

Commissioner O'CONNELL. About what period of time is required under that act? For instance, if a case were sent to the proper officer, how long does it take to select the board?

Mr. KING. The law fixes three days unless special cause is shown, and then it may be extended to five days.

Commissioner O'CONNELL. How long does it take for the operation of the whole proposition?

Mr. KING. I think, taking the average of all the cases that we have had in Canada, it would be found the boards would average something like 20 days from the time the application was put in—20 or 25 days. I do not know of any board, except by consent of the parties themselves, where the inquiry has run on longer than a month.

Commissioner O'CONNELL. The decision of the board would be rendered within that time?

Mr. KING. Yes.

Commissioner O'CONNELL. Have you knowledge of an affair that occurred on the Grand Trunk Railway system between the shop men and the company some two years ago?

Mr. KING. Yes.

Commissioner O'CONNELL. Have you any idea of the time that was occupied there?

Mr. KING. There, I think, there was quite——

Commissioner O'CONNELL (interposing). I think they ran along over the better part of a year.

Mr. KING. It ran along quite a time.

Commissioner O'CONNELL. The real cause for which the proposition was brought up had really passed away by the time the report of the commission was made. In other words, it died at the start.

Mr. KING. I am not quite sure of that.

Commissioner O'CONNELL. Is it not possible that under the plan a cause, for instance, that would bring up an investigation might be such that there would be a lapse of time sufficient for the cause to have disappeared entirely by the time the reports have been made?

Mr. KING. If I believed a thing of that kind were likely to happen I would put a clause in the act in a moment saying any inquiry that extended over a period of 30 days should terminate at that time.

Speaking of the particular disputes to which you have reference——

Commissioner O'CONNELL (interposing). I had personal intercourse with it, and that is the reason I know it had passed away.

Mr. KING. I may be wrong in the view I hold in regard to it, but I think there were motives other than purely economic motives in connection with that desire that accounted for the length of time that it took. I do not know that I wish to say more than that about it.

The ACTING CHAIRMAN. Have you any questions, Mr. Lennon?

Commissioner LENNON. I just want to ask one question. Under the act is the penalty as imposed, say, on the workingman, of a \$10 fine, enforceable? Suppose they refuse to pay, what happens?

Mr. KING. If the penalty is imposed and they refuse to pay it, I think the State will take such means as it has at its disposal to collect the money.

Commissioner LENNON. That is to say, they may be subject to imprisonment?

Mr. KING. Yes.

Commissioner LENNON. That is all.

Mr. KING. In regard to that feature, speaking of the imprisonment feature, personally I have as little love for that meaning of dealing with any question as I am sure Mr. Gompers has. If the act had been used in any way, or if there were any indication it was likely to be used as a means of compelling or insisting upon men acting contrary to what were their own interests, I imagine that clause would have been repealed long before this. It really has worked out nominally rather than really, inasmuch as the penalty is put on to compel a man to do a thing which experience has shown is in his own interest, namely, to have a grievance investigated. That is where the application of the penalty comes in—his unwillingness to submit to investigation, in the investigating of which they themselves have the choice of an investigator, and that being the case, and the award not being binding on the parties, the penalty end of the act is a very small affair. It hardly enters into consideration.

Commissioner LENNON. Then the fine was really imposed because they struck contrary to the law?

Mr. KING. That would be the reason; yes.

Commissioner LENNON. And that was the case in the one you cited when you were on the stand before?

Mr. KING. Yes.

Commissioner LENNON. That is contrary to the law, they did not wait for investigation, and they were fined for striking, that is, they were fined for quitting work?

Mr. KING. Yes.

Commissioner LENNON. That is all, Mr. Chairman.

Commissioner DELANO. Mr. King, I understand from your point of view on this subject that you recognize that the public, who may be entirely ignorant of the claims of the contending parties in an industrial dispute, have a right to demand that there shall be a cessation of any hostilities until they shall have been informed of the facts?

Mr. KING. That is the basis of the whole act. I was going to mention that in the discussion here before, as I have listened to it, the entire discussion seems to have been confined to the two parties to the industrial dispute. Nothing has been said about the rights or obligations of the third party, which is the community as a whole; and the Canadian act proceeds on this basis, that neither would capital be able to gain dividends nor would labor be able to gain wages unless it were for what the community, organized as a community, does for both. In other words, Government maintains law and order; it makes possible the development and organization both in labor and in capital. It enables modern industrial society to be carried on under the methods in which it is carried on, and therefore makes possible to each whatever gains are made. Now, if that is true, certainly something is owing to society in return, whereby the community shall not be adversely affected where it is not in fault one way or another, and the Canadian act proceeds on that line, that the public are to be given an opportunity to know, in regard to something which affects the public, the right and wrong of the situation.

There is this further feature. Mr. Emery, I think, cited Burke; I should like to cite Burke, too. Burke said somewhere that justice was the common concern of mankind. That being so, an act of this kind is framed with the view of enabling the public, which is mankind, to know in regard to the justice of the situation, and bring public opinion to bear on the side of the party that is in the right. That is the underlying motive of it.

Commissioner DELANO. And it is on that basis that you do not think that it is either unfair or in any sense slavery either to the employer or to the employee to compel him to hold his hand for 30 days while the investigation is being made?

Mr. KING. Perhaps I should put it in this way: It all depends on what the alternative is that is presented. If the Canadian act said "We will prevent you from striking and locking out," and presented no alternative, I would agree with my friend Mr. Gompers that that was taking away a right from people; but if on the other hand they say "In consideration of your holding your hand we will give you an alternative method which we think will enable you to obtain justice in a better way than through a strike or a lockout, and

you are not to strike until you have taken advantage of it," then it seems to me you have substituted a wider liberty rather than helped to enslave people.

I will put the case concretely. Take it in regard to the strikes on street railways. We have had, since this act went into force, one street railway strike in the Dominion of Canada, in all the cities and towns. That strike lasted about 10 days, in Winnipeg. But before the act went into effect there were strikes on all the street railways going on all the time in some of the cities in the Dominion. In estimating the value of the act and the amount of the slavery or withholding of rights that was involved, one has to ask the question, Are the workmen connected with the industry to-day in as good a position or in a better position, by virtue of having had this system of investigation, to obtain their rights; are they in a better position than they would have been under the old system of simply having to strike for them? What we do is this: We say to a body of men, assuming there was a strike going on in the city of Washington, on the street railways, "You choose anyone you please, Mr. Gompers or anybody else you wish to represent you, and we will give Mr. Gompers, by the State authority, a right to look into the books of this company, and we will give him the right to examine any witness he pleases, whether the manager of the corporation or the president or anybody else, and we will give him the right to have a choice as to the chairman, and we will give you the right to appear before this tribunal by anybody you wish as an advocate, your own trade representative or any person you like, and you can make out your case before the public in that way, and if after all that has been done, the board is unable to do you justice in the situation, then you are free to strike or lock out;" if a substitute of that kind is provided, I fail to see where we are introducing anything approaching slavery to an industrial worker. What you give as an alternative must be considered in comparison with what you take away.

Commissioner DELANO. That is all.

Commissioner WEINSTOCK. From the statement you made, Mr. King, 13 per cent of the disputed issues ended in strikes, and 87 per cent were settled without cessation of work. Is that right?

Mr. KING. Yes, sir.

Commissioner WEINSTOCK. The claim is made that the percentage of amicable settlements by voluntary conciliation in this country far exceeds the percentage of peaceful Canadian settlements under this act. Have you looked into that at all.

Mr. KING. The settlements by voluntary conciliation, including all of the trades of the country?

Commissioner WEINSTOCK. Yes.

Mr. KING. I can not believe that that is the case.

Commissioner WEINSTOCK. Commissioner O'Connell was my authority for that.

Commissioner O'CONNELL. What was that? I did not hear you.

Commissioner WEINSTOCK. The statement is that the percentage of peaceful settlements by voluntary conciliation in this country far exceeds the percentage of peaceful settlements under their act.

Commissioner O'CONNELL. I have not discussed the matter with you at all.

Commissioner WEINSTOCK. Perhaps it was Mr. Lennon, then, from whom I got that.

Commissioner LENNON. No; it was not.

Commissioner WEINSTOCK. Somebody made that statement.

Commissioner DELANO. That statement was made on the stand by some witness.

Commissioner WEINSTOCK. I had forgotten who made the statement; but is that in harmony with your knowledge of conditions, Mr. King?

Mr. KING. I could not say how many settlements have been effected in this country by voluntary conciliation. Without knowing the exact number I would hesitate to express an opinion.

Commissioner O'CONNELL. I do not think there is anyone living who does know.

Commissioner LENNON. I am willing to back up the statement. I do not know who made it, but it is a fact.

Commissioner WEINSTOCK. In your judgment it is a fact?

Commissioner LENNON. Yes.

Mr. KING. Of course, there is this to be considered in addition: That the settlements under the Canadian act do not begin to represent the number of settlements that may have been made by voluntary conciliation.

Commissioner WEINSTOCK. Outside of the act?

Mr. KING. Yes; and the fact that the act is there is one of the strongest weapons for producing voluntary settlements. I may mention something that was told me by one of the largest manufacturers in Canada on that point. He said, "But for the existence of that act we would have let our men strike, and we would have fought and beaten them, but knowing that under the act we would be compelled to submit to an examination of all of our books, and that many things would have come to the knowledge of others that we did not wish to be known, we settled with the men voluntarily instead of otherwise," and I think a very large percentage of the differences may be voluntarily settled in Canada, a very much larger percentage than are settled under this act. In fact, this act does not go into operation at all until one of the parties is in position to make his affidavit that but for an investigation a strike will take place. This figure only represents the cases that can not be settled voluntarily. Not all the cases that may come up are settled under the act.

Commissioner WEINSTOCK. It is like an act of last resort.

Mr. KING. It is an act of last resort. It is to prevent the necessity of stopping men from working and earning support for themselves and others. They have to go through this process, and then after that they may strike if they wish, but it gives to them that interval.

Commissioner WEINSTOCK. Some one has said that you can not imprison a union. If a trades-union should strike and violate the law how would that condition be dealt with by the Government?

Mr. KING. I presume that individuals would be proceeded against for violation of the act, if any person cared to lay an information.

Commissioner WEINSTOCK. The initiative is not taken by the Government?

Mr. KING. No; that is a feature that I can not bring out too strongly. The opponents of this measure dwell constantly on the necessity of penalizing, whereas in the experience of seven years it has been shown that the penalty end of it is hardly a consideration with the public or anyone, and the possible questions of difficulty that might arise do not arise in practice.

Commissioner WEINSTOCK. To the best of your knowledge and belief if a referendum of this act was made to the workers of Canada how do you think they would vote on it?

Mr. KING. The answer I might give to that would be one that was recently made by Sir George Asquith when he was in Canada. He came over from the old country, and he met the employers and the men and the public to find out how they viewed the act, and he presented his report to the British Government, and, as I recall it, it was very strongly an indorsement by all the parties who had been under it.

Commissioner WEINSTOCK. Would the act, in your judgment, be as successful as it has been if there were no penalties attached to the act and if the plan outlined in the Newlands Act was followed, which does not provide any penalties?

Mr. KING. In many ways I would prefer to see an act without penalties, because I really think they are misleading. The penalty to a certain group of men may have a restraining influence. It may prevent sudden and precipitate action, which if developed might result in something serious, and to the extent to which it provides that kind of thing it is helpful, but I think in a great many cases if there was no penalty at all, really if a body of workmen felt that they had justice on their side, they would be only too ready to take advantage of that kind of investigation so as to put their case before the public.

Commissioner WEINSTOCK. Are we to understand from your experience of the past seven years that you would, as the author of that act, having to rewrite it, eliminate penalties?

Mr. KING. I might be willing to do it. On the other hand, I will not say that I could get Parliament to indorse it. The question came up, "Can you secure for workmen their alternative to strike and the opportunity of having a board partially of their own choice, giving them the power of securing, after the inquiry, the right to strike or lock out, as you please—can you secure all of that at the expense of the State without doing anything for the State in exchange?" When it came to considering the representation that there is in the House of Commons, a body two-thirds of the members of which,

I suppose, are from rural communities, and considering the representatives from urban districts who for the most part are not representatives of labor but of capital, it became very apparent to those of us who were in favor of it that we could not get anything unless we had something to give the State in return.

That is the whole basis of that law; it is an endeavor to secure the workmen the right to have their grievances fully entered into, to have public opinion focused on the particular wrong, in the belief that if you can focus public opinion on a wrong, publicity is a more effective remedy for certain classes of industrial evils than any penalty.

Commissioner WEINSTOCK. With a knowledge of the conditions prevailing in the United States, eliminating penalties, how do you think that act would work out in the United States?

Mr. KING. Well, I would hesitate to speak in reference to any one country. I would speak generally, that human nature is pretty much the same the world over, and I can not see why a measure that works successfully among one particular group of men should not work equally successfully among other groups similarly placed.

Commissioner WEINSTOCK. If you were a citizen of the United States, would you advocate the adoption of the plan minus penalty?

Mr. KING. I would advocate with all my heart any measure that will help to gain publicity.

Commissioner WEINSTOCK. You believe that it does gain publicity?

Mr. KING. I do not know of any more effective means.

The ACTING CHAIRMAN. In case you omit the penalty, which I understand is either fine or imprisonment—is that true?

Mr. KING. "Fine" is the way it reads in the act, but if the men can not pay the fine the men are imprisoned.

The ACTING CHAIRMAN. Would not this act resolve itself into substantially what several of our American States have already, in that they have the power of compulsory investigation at any time when they have knowledge that a strike is impending or that it is in progress? I presume you know that we have got a number of States that have that power?

Mr. KING. Yes.

The ACTING CHAIRMAN. In other words, it was not the result of what you could look upon as legislative bargaining; that in order that the unions might get the power of investigation, the unions subjected themselves to fines, and it came about in those various States under the simple power of the States to make an investigation.

Mr. KING. Excuse me. In connection with the States you are speaking of, are there any in which the workmen themselves have the appointment of the man who is going to do the investigating, or is this investigation done at the instance of an official already appointed? That is the essence of the difference in the form.

The ACTING CHAIRMAN. I have a memorandum in general about the various States and the initiation. It is, of course, in this country made by a permanent board of mediators or arbitrators, by the State officially; investigation can be made on the motion of either party, labor or the other; it is supposed to be an impartial investigation by the State of all the facts, with power to bring papers and books to the court. I do not think it is true that the laborer, a private citizen, not having the oath of office, would have the right to question the witness. I think there is that difference.

Mr. KING. That is the essence, really, of the principles underlying justice in our measures, as we see it. Confidence, after all, is the thing to be sought in adjusting industrial differences, and by allowing workmen to choose their own members on the board, and endowing them with power that the judiciary has, we feel we are going much further than has ever been gone in any country that I know of in bringing about a condition of democracy; it brings the judiciary practically down to the people, by allowing them to select the judge by which they are to be tried.

The ACTING CHAIRMAN. Then these laws, where they have the power of investigation, would come out about the same as yours, if, whenever a dispute arises, the State could ask the two sides to appoint their representatives to meet with it, and giving them also the power of questioning witnesses.

Mr. KING. What I have thought is this, in regard to a measure of that kind: If a law were passed which would say to the parties, "In the event of your withholding your hand until investigation has been made, we will give you

the right to name your own members on the board; if you do not withhold your hand we will appoint the board without considering you one way or the other, and simply consider the public."

I believe the effect of such a law would be that in a large percentage of the cases the parties themselves would ask for the board to give them their own method and adopt that method before they went into strike or lockout.

The ACTING CHAIRMAN. Of course the other side might take immediate action in order to get immediate results; that is, the employer can fire all the men if he thought he had the right, or the employees might all strike at once if they thought the employer was going to get ready to bring in strike breakers, so that we would not have that compulsory withholding of warfare by law, so that it might be brought about. If we have the detail, I should think the question is, Would it have that power to investigate now in very many States? In some of them it operates very near the point where the local unofficial or extemporaneous representatives have the power, not perhaps the actual questioning, but the power of suggesting the questions which the commission should ask. If the penalty is going in desuetude in Canada, then it might be that we could get all of the advantages of the act either by moving in this direction that many of our States have moved in, without penalty.

Mr. KING. I think in some cases it would be quite true that the advantages obtained would be just as great without them as with them. At other times extreme men are prevented from taking extreme action by the penalty, and an industrial dispute would appear to be much more easily settled if the issue can be confined to the economic question and is not complicated by a number of personal differences and animosities, which are certain to arise when the dispute gets into the strike or lockout. That is the advantage of the penalty, the withholding of a strike taking place before inquiry.

Commissioner O'CONNELL. Was not there a case which occurred in connection with some mines where the men were fined for employing men to go into the mine for the purpose of striking, or something of that sort, in some mine trouble in Nova Scotia or other Provinces?

Mr. KING. In the case that I have referred to, the fine was imposed on the men; that was in connection with a mining strike, and it was for going out on strike before the board was appointed. I do not think there has been any other case.

Commissioner O'CONNELL. The men were not fined for employing men to go into the mines and then striking?

Mr. KING. I do not think there has been such a case; I don't recall it.

(Here Mr. King left the stand and again returned.)

Mr. KING. Mr. Gompers has just spoken to me, reminding me of something. It may be the same strike that you have in mind, Mr. O'Connell, in the Cobalt district, where there was a strike. This question came up, as to who should be fined. I do not know that I stated directly, but the principal reasons were that they were fined, and as I remember it, it was the officers of the union that were fined. Mr. Gompers has reminded me that the officers themselves were not actual workers in the mine, and that consequently they were fined for something somebody else had done. If that is the question you were alluding to, I was wrong in conveying the inference that no such cases had taken place. The officers of the union were the men fined, and I think on that same matter there is a section in the act that any one who incites men to strike in violation of the provisions of the act are liable to fine. I think they were fined under that clause, that they were inciting the strike prior to the inquiry.

(Here Mr. Gompers resumed the stand.)

TESTIMONY OF MR. SAMUEL GOMPERS—Recalled.

Mr. GOMPERS. If I might, I would like to supplement this statement made by Mr. King. It was suggested by the question asked him as he was about to leave the stand.

The facts in the case, as they came to me, were that the miners themselves went on strike, and after they were on strike they made application to the union for the benefits provided by the laws of the union to support them in the event of their being on strike, and the officers of the union furnished these miners with the benefits to which they were entitled, and for so doing these officers were arrested and fined for aiding and abetting a strike in violation of law.

The ACTING CHAIRMAN. Mr. Ballard has a question to ask you, Mr. Gompers. Commissioner BALLARD. In taking up questions of conciliation, arbitration, and collective bargaining, which we are trying to study, to be on any large scale they can exist only where both sides are well organized? It requires organization on both sides to have this collective bargaining?

Mr. GOMPERS. The best results are obtained that way.

Commissioner BALLARD. And it must be mutually agreeable to both sides?

Mr. GOMPERS. Yes.

Commissioner BALLARD. Being a manufacturer myself, I have, naturally, in my life heard the manufacturers' arguments against the organization of which you are president, and these are all along the lines of limitation of output, boycotts, coercion, breaking of contracts, and industrial strikes, refusing to use nonunion-made materials. All these things have come up, and I have no doubt a great many other things have come up on the other side.

It has occurred to me that if a commission—I do not care how many, but we will say six—representing the workmen and six representing the employers, and perhaps with or without some of the public, could be appointed, they could formulate a declaration of principles which might establish such fundamental principles that they could be agreed to on both sides, as, for instance, accepting the principle of the rights of property and an acceptance of the rights of the workmen, and citations, and conditions, and all that; could not that commission, if they formulated such fundamental bills of rights—don't you think that would put the case in such a condition that the manufacturers who wanted what was right and the workmen who wanted what was right could get together on some common ground? For instance, as you stated, declare the right of the workman to quit wage slavery, and on the other side, the right of the employers to discharge would be recognized, remembering always that the employer has before him the fear of loss in his business; it seems to me if some declaration of principles could be agreed to by both sides in this controversy, that would be a long way toward having some common ground where we could all stand.

Now, for instance, just on that very line of thought, the American Federation of Labor has with it, I understand, the Western Federation of Miners, and in this rather spectacular and unfortunate Calumet copper strike, in Michigan, it has come to my attention, the declaration of principles of the Western Federation of Miners. Let me read them to you as a fair man, and in a fair and honest spirit see what you think of a declaration of principles on the part of the employees, if you were running a factory on that plan yourself.

Here is the preamble:

"We hold that there is a class struggle in society, and that this struggle is caused by economic conditions.

"2. We affirm the economic condition of the producer to be that he is exploited of the wealth which he produces, being allowed to retain barely sufficient for his elementary necessities.

"3. We hold that the class struggle will continue until the producer is recognized as the sole master of his product.

"4. We assert that the working class, and it alone, can and must achieve its own emancipation.

"5. We hold, finally, that an industrial union and the concerted political action of all wageworkers is the only method of attaining this end.

"6. Therefore we, the wage slaves employed in and around the mines, mills, smelters, tunnels, open pits, and open cuts, have associated in the Western Federation of Miners."

I can not help thinking that there must be some common ground for a declaration of principles which all men in the country will recognize as fair, and then, if we could agree on that common ground, that would be a good start for conciliation, arbitration, and mediation; but when men start out by saying that they are the sole owners and that they are the "wage slaves" it seems to me they can hardly expect the manufacturers and employers to be willing to treat with them.

Mr. GOMPERS. Mr. Commissioner, I think you will agree with me that to give anything like an intelligent, comprehensive answer to all the matter which you have presented, will require not only a book, but a series of volumes. I shall endeavor to say just a few things in connection with the question you asked and the subject you have mentioned. I can not think of them all. My memory does not serve me that well.

First, let me say that there can be no question in our life that there are rights of property, and in any declaration of principles and any series of principles which the commission may formulate, that provision may be contained; but that is not offset nor is it corollary to say "Proper sanitation for workmen." If this commission or if any body of men should undertake to declare a series of principles and assert as one of them the rights of property, the only other question and the only one which should precede it is the matter of the rights of man, the mere matter of an incident, nor does it at all compare to the declaration of the rights of property. The Declaration of Independence was a declaration of the rights of man politically and religiously. The commission is dealing with a new question, the newer question, the modern question, the rights of man industrially—that is, to help by all means within its power the great movements of men and women of labor, of sociologists, of welfare of workers, of social workers—to establish the rightful relations or the more rightful relations, if you please, between the workmen and the employers.

It is, perhaps, not quite just to me to require me to answer the question in regard to the preamble of the declaration of the Western Federation of Miners, because the declared policies are not in accordance with my views. When occasion has arisen, I have had no hesitancy in saying so. There is this other question in connection with the Western Federation of Miners which should not be lost sight of. The policy which that organization has pursued in the past six or seven years has been of the most conservative, constructive character. The mere fact is this, Mr. Ballard, that whether deserved or undeserved is not material now, but the Western Federation of Miners has been given a bad name by its enemies and by their declarations, giving a seeming cause for it, and it seems that no matter what the organization may now do or propose to do for the protection of the rights and interests of the metalliferous miners, there seems to be a concentrated effort on the part of the enemies of that organization to defeat it in its very honest, honorable efforts. That is the point.

I am at variance with that declaration. The American Federation of Labor is at variance with that declaration. But because an organization in its youth, in its early days, has made mistakes—if it has made mistakes—is no reason why it should not be given an opportunity to become right. That organization has not been given that opportunity in Calumet, or in Minersville, N. Y. I know of this incident: A member of the executive council of the American Federation of Labor was requested to go to Calumet and make an investigation of the conditions there. To no man on earth will I more readily yield my judgment and my opinion than to him, and in no man have I greater confidence in his good judgment, his honor, and his honesty. He made the report that no men on strike were ever more justified than our miners in the Calumet district, and no men have conducted themselves more peacefully, more conservatively, and more within the law than have these men.

If I may be permitted to take the time, I will tell you the story of the Quaker, who had purchased a chunk of meat for himself and his good wife for their evening meal, and had it wrapped up in his hand. A great big dog came along, and, sniffing the meat, grabbed it and ran away. The Quaker would not kill the dog nor would he hurt the dog—it was against his faith. But he said: "I will give thee a bad name, that thou art a mad dog; a mad dog art thou," and repeating it louder and louder, he ran after the dog until a great crowd followed and then led him in the chase for the dog, and the crowd killed the dog and his conscience was free.

Commissioner BALLARD. I will say I was for some time president of the Employers' Association, of Louisville, Ky. During that time one of our members got up an organization, and I did not consider his rules of organization or his methods or his principles were correct. I sent for that member. I told him so; I told him I would not stand for it and that our association would not stand for it. He said, "What do you intend to do about it?" I told him, "Publish it in the newspapers and expel you."

This preamble is the same preamble of the Western Federation of Miners to-day, and this report from which I have read it is report No. 139 of the United States Department of Labor, February 5, 1914.

I am not doing this to criticize, but only to bring out what is fair. I want to say, as a fair man myself, if I were called into an arbitration between a union, if you choose, or an employee or association of employees, and an employer or association of employers, and I was met at the beginning with a declaration of principles like that, I would feel compelled to say, "Gentlemen, you must

change your principles before I can either arbitrate or act, because the declaration of principles does not accord, as you said, with the Declaration of Independence of this country." Therefore, I repeat that if you could get a commission or a committee of laboring men and employers who would formulate some declaration of principles which was mutually agreeable, I do believe it would be quite a step toward bringing forward more friendly and better relations between organized labor and organized capital.

Mr. GOMPERS. As to whether the question of the declaration would bring that about, I am not quite so sure; but I am quite in accord with you in the purpose of coming to some sort of mental agreement, the creation of a condition, that a few fundamentals may be the basis for our future progress. The antagonists to our movement charge the labor movement to-day with endeavoring to limit output. That is quite contrary to the facts. The labor organization of decades ago, not to-day, did that. The labor movement of to-day asks for the establishment of a workday of not more than eight hours. That does not mean a limitation of output. It means a limitation of the day's work, a limitation which every economist, every man who has studied the human character and the human make-up, and the difficulties upon the worker in the modern industry, agrees is the wisest, industrially, economically, and socially.

If I may be permitted I should like to submit a few observations upon something which has been mentioned here with regard, for instance, to the comparative small number of organized workmen to the unorganized.

Commissioner O'CONNELL. Before you do that, let me ask this: We have had two or three estimates here. One gentleman who appeared before us gave an estimate of 2.80 per cent of the total population as being organized. Others gave it all the way up to about 80 per cent.

Mr. GOMPERS. Of course, such a statement is not only ridiculous, but ludicrous, when you come to compare, even if the figures were right; for, as a matter of fact, counting the average family in the population of the United States as five to a family—that is the generally accepted number—it is not quite fair to consider that population of 5 to a family and 95,000,000 people in the United States, when there are 3,000,000 organized adults. There are not 5 of those as compared to the population in the family, but there are 3,000,000 adults.

The question must also be considered from this viewpoint, or this fact must enter into consideration. The farmers are not counted in the ranks of the organized labor movement, of the organized workers in the American Federation of Labor, and in the brotherhoods. The farm laborers are not, as a rule, organized. They are not counted. The employers, large or small, are not enumerated. The business men are not enumerated, large and small. The men in the professions of law, of medicine, of engineering, are not enumerated. The men office workers, in clerical work, are not enumerated.

Commissioner WEINSTOCK. In the civil service?

Mr. GOMPERS. In the civil service of the United States and of the several States and of the communities, they are not enumerated.

In a trade or an industry in which there are, in some instances, nearly 100 per cent of the workers organized, sociologically speaking, when there is one worker affected, all are affected; when a wrong is done to one, it affects the whole of society's conditions and its members. But, in so far as relations between employers and employees are concerned, the 100 per cent organized have the right to speak for that industry; there is no question about that. There are numbers of them in which there are 98 per cent, 95 per cent, 90 per cent, 85 per cent, 80 per cent, 60 per cent, 50 per cent, 40 per cent organized; some of them poorly organized, it is true. Surely those who are well organized have the right to speak in the name of themselves and for themselves and for each other.

I think I understand Mr. Mackenzie King's fundamental idea, and principally I am in accord with him; but he has told the commission that the only reason why the penal clauses were adopted in the Canadian law was because they could not get a law through Parliament without it; and that because the Parliament was made up of a larger number of farmers and a few from the urban districts, was the reason that was put in there; in other words, because they could not get a law through the Parliament of the Dominion of Canada without the penal clause was conceded, and the liberty—I do not care what you call it, you may call it by any other name—but the liberty of the workman was frittered away and bartered away because of the make-up of the Parliament.

Commissioner WEINSTOCK. May I at that point ask what would be the attitude of the American Federation of Labor to a new act if the penalty clause were eliminated?

Mr. GOMPERS. I have already stated in my direct statement that I doubt if there would be much of an agitation, except there would be always the apprehension of building upon, building upon, building upon, until the time to attempt to urge the compulsory arbitration and penal features.

Commissioner WEINSTOCK. If that act were submitted without the penalty clause, would the American Federation of Labor oppose it or support it, so far as you know?

Mr. GOMPERS. Mr. Commissioner, there is another thing I want to say in connection with that, and if you will kindly permit me to reserve my answer until I have stated that, or if I do not state it, I will be thankful if you will repeat the question then, and I will answer it.

What is justice? Talk about the court of arbitration or the court of investigation finding out justice and declaring it. What is justice? What was justice 10 years ago is regarded as a great injustice to-day. Justice is a concept, is an attitude of mind. The report of the Anthracite Coal Strike Commission was quoted here as having been ideal. Is there any man in all America who imagines that an award of the character made by the Anthracite Coal Strike Commission could have been rendered if the coal miners' strike had not occurred?

In 1897 the coal miners in the bituminous and the anthracite fields were simply impoverished and demoralized, and living in poverty and misery while working—not while idle. Their committees, committees from these districts, would come into the cities with credentials signed by the mayors of the town and the governor of the State, authenticating that these men were making a justified appeal for the poverty of miners and miners' families, and they came to the workmen, to us, to appeal for contributions while they were working. It was the strike of 1897 of the miners in the bituminous fields that checked that downward tendency of more than 15 years. You will remember during the political campaign of 1884, when the misery of the miners in the Hocking Valley was flaunted before the people, and it was only in the political campaign, as a political event, that it was used as political material; but when the campaign was over men had not the slightest advantage as the result of that campaign; not a thing. They were pitied but that is all.

But in 1897, when the remnant of the miners' organization declared for a strike, I think on July 4, 1897, and the men responded in their desperation, finally after about 16 or 17 weeks' strike an agreement was reached with the operators, and there was the establishment of a scale. Within a year afterwards they met again and established another scale with an increase in wages, and established for the 1st of April the eight-hour workday and in all the bituminous coal fields improved conditions, brought about the abolition of the "pluck-me" store, the company store, the right of the men to purchase their things and necessities wherever they desired. The contagion caught the miners in the anthracite region, and they went out on strike, with the result as we know. The second strike was ended by the coal strike commission and the award.

It is true that that commission made the declaration quoted by Mr. Emery; but it is equally true that that commission reduced the hours of labor to nine per day, and it also granted an increase of wages of 10 per cent, and it accorded to the miners the right to purchase their powder wherever they chose, and to make their purchases free from the coercion of making their purchases in the companies' stores, which meant, all told, more than 30 per cent increase in their wages and a reduction of their working hours and the establishment of better conditions.

Since then have come still greater and better improvements in the conditions of these men. And now, instead of the Federal authorities hearing and investigating and adjusting conditions between the coal operators in the anthracite coal regions and the coal miners, representatives of the coal operators and the representatives of the union miners meet and adjust their differences and endeavor to reach an agreement.

And this is the point I want to make: Had the coal miners prior to 1897 in the bituminous region appealed to a commission, if it were in existence in the United States, such as obtains under the act in Canada, if they were to ask for an investigation, an investigation would have come.

What justice would the miners have gotten? They might have gotten a cent or two a ton. But the strike of the miners in the bituminous regions and the strike of the miners in the anthracite region abolished wrongs and abolished misery and poverty and dependence that a century of investigation of a commission and all the altruism of which its members could be possessed would not have abolished, and that strike established justice that could not have been established in any other way.

In the garment industry, the sweatshop system and the miserable tenements and homes, where bedrooms were made workshops, and they were all huddled together and living in misery and degradation and poverty, where they were idle at certain periods and employed at other times, suppose they had asked for an investigation at the hands of the commission in the State of New York or of a Federal commission, they would have gotten just what the laundry workers got in the city of New York when they asked the Bureau of Labor to make an investigation, just what the miners in Minerville, N. Y., got—nothing; nothing but a word of sympathy, and then like the Philistine they walked by on the other side.

There was a time, you remember, just during the anthracite mining strike, when Mr. George Baer declared that he would not meet with the representatives of the miners' union; that he and other employers of labor were the trustees appointed by God to handle the interests of those members, and that they were to administer them in the interest of their working people. Well, I know that Mr. Baer has revised his industrial policy as to his working people. He now meets with them, and in determining as to his trusteeship.

The ACTING CHAIRMAN. Mr. Gompers, we would like to adjourn in a few minutes.

Mr. GOMPER. Do you mean now?

The ACTING CHAIRMAN. No; in about 10 minutes.

Mr. GOMPERS. I can finish up, I think, in that time. I want to call attention to the fact that the members in no industry which I know are threatened with such calamity or total extinction as are the men engaged in the glass bottle industry. An automatic machine has been invented which does not require any man's attention. It simply gathers the glass and blows it and molds it and forms it and makes it complete, and the men, the employers who want to continue in the business in the best way they can, meet the representatives of the workmen and try to devise some way to meet this condition which confronts us. They have agreed upon reductions in wages, have agreed so that the men might be enabled to work; to find some work. They have tried to devise some means in their rules and regulations by which the glass workers who are still here may not be totally thrown upon the streets, and the whole trade disappear; and that is a subject for the adverse criticism of Mr. Emery, criticism of such a condition of the union that Mr. Emery would not belong to, and those men made the type of bad, bad men, who would resolve upon anything of that character. Well, I am not called upon to make any criticism of the legal profession, but I do think that the members of the legal profession are making it daily and hourly and yearly more difficult for a young man to pass the legal examinations, and making the requirements of graduation and practice more difficult. Of course, that is on the hypothesis of making better lawyers, but, as a matter of fact, it is for the purpose of limiting the output of lawyers.

I want to say a word with regard to the International Typographical Union, and in regard to that declaration. It is not the first time we have been confronted with that declaration. I just want to call your attention to what it was, and the cause of it and what it really portends. In the International Typographical Union there existed or it was alleged that there existed, a body of men consisting of only a few in certain local organizations throughout the country which had a common purpose, a common policy, to control the legislation of that organization. Mr. Frank Morrison, the secretary of the American Federation of Labor, a delegate from his local union in Chicago to the Colorado Springs convention of 1896, made that charge in the convention and there was a committee appointed to draft a declaration which every member was expected to subscribe to, particularly every delegate and every ex-delegate who was in attendance was invited to take the obligation, that he would belong to no other organization affecting the trade, affecting his conduct within the International Typographical Union, and that is the whole sum total and purpose of that declaration.

It has been made to appear before committees of Congress making investigations, as it was made to appear here this afternoon, as if that declaration was designed as an obligation of treason to the United States.

Commissioner O'CONNELL. That inner wheel was known as the Juniata, was it not?

Mr. GOMPERS. The secret organization was known by a number of names, Indian names, Juniata, and several other titles. I am not so sure whether it ever existed or now exists. As a matter of fact, one of the prominent men who was asked the question, said that it was a myth, and the printers always had a good deal of fun with him and about him. They said that he said it was a myth; that it was a very tangible myth, and all that. At any rate, what I want to advise you gentlemen is that there is no question but that what I have mentioned as to the cause and purpose of this declaration is true, that it is exactly what I have told you, nothing more and nothing less. It was with the idea that if such a concern existed, the organization should be freed of it, if such a concern existed, of ridding the organization of a small coterie of men controlling the legislation of the organization, because they were working in concert with each other.

Commissioner WEINSTOCK. You asked me to remind you of my question?

Mr. GOMPERS. Yes. May I have just one moment more? Mr. Emery said that I always speak in extremes. I do not. I speak probably emphatically, but not in extremes. What I said as to the steel industry applies to the building trades, it applies to the textile trades, it applies to the iron trades, it applies to the boot and shoe industry, it applies to the garment industry, and many, many others; the great, basic industries of the country.

Just one more word on the question of the street railway men as they exist, and the organization which has come in Canada, without strikes. That is true, too. There is more justice coming to the miners, now, because they standardized their strike. They standardized somewhat the industry, wages, and conditions and hours of labor. So in the garment trade; it is somewhat standardized as to wages and hours and conditions, and sanitary conditions. And it is so in many industries. The strike in Canada on the street railways helped to establish a better standard of wages, and it is easier now to establish or to come near that standard without strikes. I have not the figures, but I do know that in nearly every industry there are thousands and thousands of agreements, collective bargains, between employers and unions, between workmen and employers, and associations of employers. Sometimes they have been obtained, in the early stages, by strikes, by contests; later by the policy of conciliation and meeting the conditions of industry, and the constantly growing needs of the workers, and the demands which they make upon society for a better life as the reward for the service which they give to society.

The ACTING CHAIRMAN. Mr. Weinstock, I suggest that if there are other questions which you want Mr. Gompers to answer, you had better formulate them in writing and have him answer them in writing, as has been done in other cases.

Commissioner WEINSTOCK. Very well, I will do that. Mr. Gompers, among the other methods that will be submitted to this commission for its consideration when it comes to make a recommendation, will be this Canadian act. We have here this afternoon the two leading exponents of that matter, Mr. King, who is the author of that act, and you, who oppose it, representing organized labor, so that it is very important to get this question as clear in our minds as we can, from both of you. We have Mr. King's opinion, and we want yours.

Mr. GOMPERS. I promise you that if you write me I will answer you fully.

Commissioner WEINSTOCK. Would you rather have me submit the questions to you in writing?

Mr. GOMPERS. Yes.

Commissioner WEINSTOCK. Very well; I will do that.

The ACTING CHAIRMAN. That is all, Mr. Gompers. We are much obliged to you. Your answers to those questions will be made a part of the hearings.

Commissioner WEINSTOCK. The questions and answers will be made a part of the hearings.

Commissioner LENNON. I want to ask a few questions, and I will do the same thing.

The ACTING CHAIRMAN. Mr. Emery, have you any point you would like to make? We have about 10 minutes, and if you could touch up what you have to say and let us ask in writing any questions that can be better handled that way, we would like to have you do so.

TESTIMONY OF MR. JAMES A. EMERY—Recalled.

Mr. EMERY. Of course I am at the service of the commission. I realize how impossible it is in the space of time we have to touch upon so many questions as are necessarily raised in a discussion like this. I should like to say one word, if I may, about one phase of this matter in which I think many employers of this country feel a very deep interest, and I should be doing a very great injustice to them and to myself, and to this commission, if I indicated by the tone of anything that I have said or by any undue exaggeration of the employer versus employee, which of course is the topic that you are peculiarly addressing yourselves to, any belief or opinion on the part of those for whom I can speak, that this commission is to put its mind exclusively to the relation of employer and employee.

We conceive that there is a far more fundamental relation at the root of many of the difficulties in the whole industrial controversy. It is a common sin of both employer and employee to treat this whole controversy of their relationship as though they were the parties of most importance, that this matter affected only them, and they could arrange their affairs or fight them out in an elementary and barbaric way, however unfitting that would be to the conditions under which we live. But they affect something else. They affect this country and all the people in it, when the controversy assumes such magnitude that it interferes with the supply of their needs or with the movement of all those instrumentalities which must be kept in motion to maintain the material aspects of our civilization; because every day that our material civilization grows more greatly it develops a burden upon those who sustain it, correspondingly. The great difficulties between employers and employees in the making of collective bargains and in the enforcing of them are not merely in those questions of policy which will always be acute as long as men have their labor to sell, and as long as they strive to get the largest return for it, and as long as those who buy it are producing under competitive conditions, not only in their own country but in the world, and undertake to estimate the cost of their labor as the most important factor in the making of the commodity which they have to sell. The man who is making something to sell is making it to sell in a given market in competition with some one else, and however much the producer of any commodity, which he must sell in order to sustain his operation of production, would like to consider only humanitarian and philanthropic notions, he is necessarily face to face with the most vital and material problem, how to continue to sell his article and how to make it and maintain the quality for the price for which he can afford to sell it in competition.

Now, all those questions of policy and concerning the hours of labor and efficiency of methods of labor are to be considered. They are immensely important problems. They are problems that will always be with us as long as men are engaged in having one man his labor to sell and another man his labor to buy, and so it was since the days of the first makers of brass. But the essential and vital thing upon which we can not afford to have differences in this country is the principle which is to underlie the collective contract, and that principle is not to be settled by employers or employees or by any commission for them—not while we live in this Government. It is to be settled by the principles of the Government in which we live, or we make an agreement outside of it and undertake to enforce it by means unknown to that Government. The vital thing in the Anthracite Coal Strike Commission report, to which I called your attention, is not the mere increase in wages and shortening of hours, important and necessary as it was, but it was the recognition of certain vital principles that ought to be recognized and enforced in all relations between employers and employees, and those principles apply not merely to the anthracite field, but they apply to every field into which men enter for the purchase and sale of labor. That vital principle is the recognition of the fact that while the organization of labor is an important and vital thing, and has played a big part in the betterment of the wage earner, and moral and physical and social aspects, that the right of the men to stay outside of that organization and sell his labor and of the other man to purchase it, and of the man who stays outside to be free from coercion and intimidation is just as much as the right of the man who goes into it.

I add a third phrase to Mr. Gompers's description of slavery. It would be slavery if any form of involuntary servitude could continue in this country so that a man was compelled to labor under conditions which he did not desire

when he wished to quit. It would be slavery if a man was compelled by an employer to work under conditions that did not suit him.

And it is equally slavery when a man may not sell his labor without securing a license from another to do so, and when he is to be annoyed or intimidated if he undertakes to peacefully pursue the calling in which he desires to earn his living for himself and those dependent upon him if others undertake to annoy him—I will put it in the mildest possible form—unless he accepts their conclusions and adopts their vehicle for the standardization of it. That principle is as vital as anything in industry.

And when you survey the whole field of industry you will observe in many trades of the very highest nature, many forms of production in which this country is justly famous the world over. That production is being carried on by men both in unions and out of them, and the fact that during the enormous periods of propoganda they have stayed out, or expressed their desire to stay out, and sell their labor individually, because they felt that they get their reward best, is not to be overlooked. There are two sides of the scale to be looked at; one side not only the man who makes the best bargain—not only that, but the man who does not want to make it, and if it is true that there is an enormous danger in the combination of great producers that control the sources of industry, there is an equal liability of abuse in the unregulated and dominating combination that controls the source of labor supply. They both have their capacity for abuse, and while we recognize the use of each, we can not close our eyes to the abuses of either, and there can be no condition in which we can continue industry in this country that does not equally recognize the principles and rights of the man who cares to sell his labor individually as well as he who cares to buy.

For 20 years we have been undertaking now to enforce the right of the smallest dealer to produce and sell at his price and under the conditions of sale that suit him best without the interference of these huge combinations of production and distribution that practically control these conditions of production, who have undertaken to make others sell at their price and under their conditions or go out of business, and we have written over the statute books of many States and in the decisions of many courts the effort of this people to express a determination to secure economic freedom for the smallest producer, and it is equally as important and essential that we shall endeavor to secure the same economic freedom for the smallest laborer, and that is an essential, vital, and fundamental principle in this country; and those whom I have the honor to represent believe in that very sincerely, and as I believe thousands of our people do, and that principle is written into our fundamental lay, and it is there the choice of those who made this Government, and with God's good grace, I hope it will remain there while we are a nation of free men.

Now, with respect to one matter in which I am accused of perhaps making a misrepresentation. I would not wittingly misrepresent any one's views, but I want to call your attention to the Typographical Union oath to illustrate why I thought that was an obligation he ought not to take. I read you the plain words of the phrase: "That my fidelity to the union and my duty to the members thereof shall in no sense be interfered with by any allegiance that I may now or hereafter owe to any other organization, social, political, or religious, secret or otherwise."

And immediately thereafter occurs this phrase: "That I will belong to no society or combination composed wholly or partly of printers, with the intent or purpose to interfere with the trade regulations or influence or control the legislation of this union."

That would apparently cover any obligation necessary to lay upon the members as relate to their relationship with other unions of printers, and which apparently would not be necessary to require the subordination of religious, political, and social obligations of every kind and character in order to secure protection as far as the oath could give it against the machinations of an anonymous organization in the trade.

That appears to be covered by the others. That may be the point of view of the gentlemen, and if it was, and they gave as much thought as they apparently did to this matter, the result was an unhappy combination of language.

I do not think of any matter with relation to this subject about which I could add anything to this inquiry by suggestion of my own. I should be very glad to answer any questions, in writing or otherwise, that the commission may desire to ask, but I beg to impress the commission with the fact that so far as I know the many thousands of employees, some 200,000, that are in associations

of which I have the honor to be counsel, are not opposed to the principle of collective bargaining. When I say that they are not opposed, I do not mean that they object to other people making collective bargains; I mean that they make collective bargains themselves, but they distinguish in all collective bargains two things: Questions of principle and questions of policy, and so far as the questions of principle are concerned, I do not know of any of them who do not believe that they ought not to make a collective bargain in which they agree to employ exclusively members of the particular craft with which they dealt who are members of the union.

The ACTING CHAIRMAN. Do you consider this preferential protocol system as in violation of those principles?

Mr. EMERY. It depends upon the practical enforcement of the act, because in all these discussions respecting labor matters I find that it is very difficult to walk from an abstract proposition into a concrete reality; most of our errors are in making the passage.

The ACTING CHAIRMAN. You have heard the discussions here?

Mr. EMERY. No; I have not.

The ACTING CHAIRMAN. We are very glad to have heard from you, and if there are any further questions that the commission would like to ask, whether in writing or verbally, we will take pleasure in letting you know.

(Whereupon at 6 o'clock the commission adjourned until Monday, April 13, 1914, at 10 o'clock a. m.)

EXHIBITS.

PRINTING TRADES.

INTERNATIONAL BROTHERHOOD OF BOOKBINDERS,
February 6, 1913.

E. FLEMING & Co.,
Boston, Mass.

DEAR SIR: Believing in cooperation as we do between employer and employee, and further believing that only through such mutual understanding can the best interests for all concerned be subserved, we wish to call to your attention the fact that only through such cooperation as stated above were the present conditions now existing in Cambridge between Ginn & Co. and their employees brought about with the probability of the other Cambridge master bookbinders coming to a like agreement. Therefore we take the liberty on behalf of Local No. 16, International Brotherhood of Bookbinders, to extend to you an invitation to meet a committee from said local at a place and time to be mutually agreed upon for the purpose of trying to establish friendly relations between the master bookbinders of Boston and the said local, which result can only be brought about by such joint conference.

Thanking you in advance, we are,
Respectfully, yours,

EXECUTIVE COMMITTEE.
WM. H. MURPHY, *Secretary,*
23 Old Harbor Street, South Boston.

INTERNATIONAL BROTHERHOOD OF BOOKBINDERS,
February 6, 1913.

H. M. PLIMPTON & Co.,
Norwood, Mass.

DEAR SIR: Believing in cooperation as we do between employer and employee, and further believing that only through such mutual understanding can the best interests for all concerned be subserved, we wish to call to your attention the fact that only through such cooperation as stated above were the present conditions now existing in Cambridge between Ginn & Co. and their employees brought about, with the probability of the other Cambridge master bookbinders coming to a like agreement. Therefore we take the liberty on behalf of Local No. 16, International Brotherhood of Bookbinders, to extend to you an invitation to meet a committee from said local at a place and time to be mutually agreed upon for the purpose of trying to establish friendly relations between the master bookbinders of Boston and the said local, which result can only be brought about by such joint conference.

Thanking you in advance, we are,
Respectfully, yours,

EXECUTIVE COMMITTEE.
WM. H. MURPHY, *Secretary,*
23 Old Harbor Street, South Boston.

FEBRUARY 12, 1913.

Mr. WILLIAM H. MURPHY,
Secretary International Brotherhood of Bookbinders,
23 Old Harbor Street, South Boston, Mass.

DEAR SIR: You have addressed letter to several of our bookbinding members in Boston asking for a conference with a committee from your brotherhood.

I wish to advise that these letters have been referred to the typhotetæ and that a committee has been appointed to meet you at our headquarters, 176 Federal Street, room 504. Please suggest a date after this week upon which you would like this meeting to be held.

Very truly, yours,

_____, *Secretary.*

FEBRUARY 12, 1913.

Mr. D. J. McDONALD,
Secretary Allied Printing Trades Council,
606 Old South Building, Boston, Mass.

DEAR SIR: You have recently addressed a letter to the Plimpton Press asking for a conference with a committee appointed by your council. This letter has been referred to the typhotetæ.

As the subject matter is substantially the same as one received from Mr. William H. Murphy, secretary of the International Brotherhood of Bookbinders, which also has been referred to the Boston Typhotetæ, I assume that the inclosed reply, which has been addressed to Mr. Murphy, will answer your communication.

Very truly, yours,

_____, *Secretary.*

ALLIED PRINTING TRADES COUNCIL,
Boston, Mass., March 13, 1913.

EDGAR E. NELSON,
Secretary Boston Typhotetæ Board of Trade,
176 Federal Street, Boston, Mass.

DEAR MR. NELSON: A committee from the Boston Allied Printing Trades Council will be pleased to meet a committee duly authorized by your board to discuss the question of unionizing the Plimpton Press.

Any day of next week after Monday will be agreeable to us.

Very truly, yours,

D. J. McDONALD, *Secretary.*

MARCH 17, 1913.

D. J. McDONALD,
Secretary Allied Printing Trades Council,
606 Old South Building, Boston, Mass.

DEAR SIR: Replying to your letter of the 13th instant, our committee will meet your representatives at our headquarters Friday afternoon, March 21, at 2 o'clock.

Very truly, yours,

_____, *Secretary.*

LOCAL NO. 204, INTERNATIONAL BROTHERHOOD OF BOOKBINDERS,
Cambridge, Mass., April 15, 1913.

MR. NELSON.

DEAR SIR: I have been requested by the local unions of bookbinders, of Boston and vicinity, to ask your committee to set as early a date as possible when our wage-scale committee can meet them.

Trusting you will give this your immediate attention, I am,

Very truly, yours,

H. J. STACKHOUSE,
8 Rockingham Street, Cambridge.

APRIL 17, 1913.

Mr. H. J. STACKHOUSE,
8 Rockingham Street, Cambridge, Mass.

DEAR SIR: Replying to your letter of April 15, I wish to suggest that you take the subject matter up with the Allied Printing Trades Council, with whom we have had one meeting, and secure representation on their committee.

Mr. William H. Murphy, who represents the Boston Bookbinders Union, Local No. 16, was notified to this effect on March 22.

Very truly, yours,

_____, *Secretary.*

GEO. H. ELLIS CO., PRINTERS AND PUBLISHERS,
April 17, 1913.

Mr. E. E. NELSON,
Secretary Boston Typothetæ Board of Trade.

DEAR MR. NELSON: Stackhouse's letter of the International Brotherhood of Bookbinders Union at hand and contents carefully noted.

In the letter that we received from Murphy, who represented the Boston Bookbinders Union, he signed as secretary of Local 16. We have also had a request from the Allied Printing Trades Council, of which the bookbinders are part of the membership.

Now, we have this letter of Stackhouse's of the International Brotherhood of Bookbinders whose headquarters are at Philadelphia.

I am going to maintain my previous position; if they want to do any business they must do it through the Allied Printing Trades Council, as the scale for Cambridge, Boston, and Norwood should be uniform, and as these three bodies have membership in the Allied Printing Trades Council we will deal with them as one body and not as three individuals.

Yours, very truly,

A. W. FINLAY.

ALLIED PRINTING TRADES COUNCIL,
Boston, April 25, 1913.

EDGAR E. NELSON,
*Boston Typothetæ Board of Trade,
 176 Federal Street, Boston, Mass.*

MY DEAR SIR: I have been instructed to ask the Boston Typothetæ Board of Trade to meet a committee from this council representing Bookbinders Union No. 16, Bookbinders Union No. 204, Bookbinders Union No. 176, Paper-rulers Union No. 12, Bindery Women's Union No. 56, and Bindery Women's Union No. 207, to discuss wages, hours, and working conditions for these crafts with your organization in greater Boston.

This action is taken as per agreement reached at our conference held March 20, 1913.

Thanking you in advance for any attention you may give this communication, I am,

Very truly, yours,

D. J. McDONALD, *Secretary.*

APRIL 29, 1913.

D. J. McDONALD,
*Secretary Allied Printing Trades' Council,
 606 Old South Building, Boston, Mass.*

DEAR SIR: In response to your letter of April 25, our committee instructs me to reply by saying they will meet your representatives at our headquarters Friday afternoon, May 2, at 2 o'clock.

Very truly, yours,

_____, *Secretary.*

INTERNATIONAL BROTHERHOOD OF BOOKBINDERS,
 606 OLD SOUTH BUILDING,
Boston, Mass., August 6, 1913.

Mr. EDGAR E. NELSON.

DEAR SIR: I have been requested by the members of my organization to write you in reference to the scale as presented to us by the Boston Typothetæ, parts of same not being quite clear; for instance, the assistant on lining, etc.

We would like to have you set a date as soon as possible for a meeting between bookbinding members of your organization and our committee to discuss the matter and try to come to some final agreement.

Trusting you will give this your immediate attention, and that I will hear from you in a few days, I am,

Respectfully, yours,

A. P. WILLIAMS.

AUGUST 11, 1913.

Mr. A. P. WILLIAMS,
606 Old South Building, Boston, Mass.

DEAR SIR: I have your letter of August 6, and have conferred with the chairman of the bookbinders' committee, Mr. Finlay, who wishes to confirm his conversation over the phone with Mr. Dallas, that you state in writing the parts of the scale that are not clear to you. Upon receipt of same our committee will endeavor to clear up all these points.

Very truly, yours,

_____, Secretary.

BOSTON TYPOTHETÆ BOARD OF TRADE,
Boston, Mass., April 6, 1914.

Mr. A. W. FINLAY,
272 Congress Street, Boston, Mass.

MY DEAR MR. FINLAY: I am sending you herewith copies of the agreements between the typothetæ and the pressmen and feeders' union back to 1901.

I do not see anything back of these dates. If you recall that any previous agreements were made I shall make a more careful search. The records back of that time are mostly written in long hand and it will take a little longer to determine positively whether or not agreements were made.

The first agreement with the pressmen seems to have been in 1901. I do not find anything for press feeders until January 6, 1905.

Perhaps the inclosed will give you the information you require.

Very truly, yours,

E. E. NELSON, Secretary.

SCALE OF PRICES FOR PRESSMEN AND HOURS OF LABOR.

BOSTON, MASS., December 2, 1901.

1. Fifty-four hours shall constitute a week's work.
2. \$19 per week shall be the minimum scale for all cylinder pressmen.
3. \$14.50 per week shall be the minimum scale for job pressmen.
4. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 9 p. m. or later, one-half hour to be allowed and paid for as supper time; any part of hour after 30 minutes to be paid as a full hour.
5. In the case of the employment of a night force, the 54 hours shall be so made up as to complete the time in five nights, and the minimum rate for such work shall be \$22 for cylinder and Adams pressmen and \$16.50 for job pressmen.
6. The above scale of prices and hours for labor to be in force for three years beginning December 1, 1901.

For Printing Pressmen's Union No. 67:

JAMES T. ROCHE, Secretary.
JOHN F. SULLIVAN, President.

For the Boston Typothetæ:

GEO. H. ELLIS,
LOUIS BARTA,
SAMUEL USHER,
AVERY L. RAND,
GEO. W. SIMMONDS,
Committee for Boston Typothetæ.

SCALE OF PRICES FOR PRESSMEN AND HOURS OF LABOR AS AGREED BY THE BOSTON TYPOTHETÆ AND PRINTING PRESSMEN'S UNION, No. 67, DECEMBER 1, 1904.

1. Fifty-four hours shall constitute a week's work.
2. \$20 per week shall be the minimum scale for all cylinder pressmen.
3. \$15.50 per week shall be the minimum scale for job pressmen.
4. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 9 p. m. or later, one-half hour to be allowed and paid for as supper time; any part of an hour after 30 minutes to be paid as a full hour.

5. In the case of an employment of a night force, the 54 hours shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$23 for cylinder and Adams pressmen and \$17.50 for job pressmen.

6. The above scale of prices and hours for labor to be in force beginning December 5, 1904, till May 1, 1907.

For Printing Pressmen's Union No. 67:

CHARLES W. CLAYTON, *President.*
J. FRANK O'HARE, *Secretary.*

For the Boston Typothetæ:

GEO. H. ELLIS,
JAMES BERWICK,
LOUIS BARTA,
ASAPH CHURCHILL,
F. H. GILSON,
J. EVELETH GRIFFITH,
GEORGE W. SIMMONDS,
Special Committee.

SCALE OF PRICES FOR PRESS FEEDERS AND HOURS OF LABOR AS AGREED BY THE BOSTON TYPOTHETÆ AND FRANKLIN ASSOCIATION, No. 18, JANUARY 6, 1905.

1. Fifty-four hours shall constitute a week's work.
2. \$13 per week shall be the minimum scale for male cylinder press feeders.
3. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 9 p. m. or later, one-half hour to be allowed and paid for as supper time; any part of an hour after 30 minutes to be paid as a full hour.
4. In the case of an employment of a night force, the 54 hours shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$15 per week.
5. The above scale of prices and hours for labor to be in force beginning May 1, 1905, until May 1, 1907.

For Franklin Association, No. 18:

DENNIS F. O'BRIEN.
MICHAEL S. CONEY.
JOHN DONNELLY.
CHAS. H. MEHEGAN.
DANIEL J. McDONALD.

For the Boston Typothetæ:

GEO. H. ELLIS,
JAMES BERWICK,
LOUIS BARTA,
ASAPH CHURCHILL,
F. H. GILSON,
J. EVELETH GRIFFITH,
GEORGE W. SIMMONDS,
Special Committee.

SCALE OF PRICES FOR PRESSMEN AND HOURS FOR LABOR AS AGREED TO BY THE BOSTON TYPOTHETÆ AND PRINTING PRESSMEN'S UNION No. 67, MAY 18, 1907.

1. Fifty-four hours, and after January 1, 1909, forty-eight hours, shall constitute a week's work.
2. \$21 per week shall be the minimum scale for all cylinder pressmen.
3. \$16.50 per week shall be the minimum scale for job pressmen.
4. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 8 p. m., or later, one half-hour to be allowed and paid for as supper time, any part of an hour after 30 minutes to be paid for as a full hour.
5. In the case of an employment of a night force, the 54 hours, after January 1, 1909, the 48 hours, shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$23 for cylinder and Adams pressmen, and \$17.50 for job pressmen.

6. The above scale of prices and hours for labor to be in force from June 1, 1907, to June 1, 1910.

For Printing Pressmen's Union, No. 67:

THOMAS E. LOONEY, *President*.
J. FRANK O'HARE, *Secretary*.

For the Boston Typothetæ:

GEO. H. ELLIS.
F. H. GILSON.
GEORGE W. SIMMONDS.
J. EVELETH GRIFFITH.
R. E. SPARRELL.
SAMUEL USHER.
ASAPH CHURCHILL.

SCALE OF PRICES FOR PRESS FEEDERS AND HOURS FOR LABOR AS AGREED TO BY THE BOSTON TYPOTHETÆ AND FRANKLIN ASSOCIATION, No. 18, MAY 18, 1907.

1. Fifty-four hours, and after January 1, 1909, forty-eight hours, shall constitute a week's work.

2. \$14 per week shall be the minimum scale for male cylinder press feeders.

3. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 8 p. m., or later, one half-hour to be allowed and paid for as supper time, any part of an hour after 30 minutes to be paid as a full hour.

4. In the case of an employment of a night force, the 54 hours, and after January 1, 1909, the 48 hours, shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$16 per week.

5. The above scale of prices for hours and labor to be in force from June 1, 1907, to June 1, 1910.

For Franklin Association, No. 18:

JOSEPH A. DART.
MICHAEL S. COONEY.
DANIEL J. McDONALD.
CHAS. H. MEHEGAN.
MICHAEL H. O'CONNOR.

For the Boston Typothetæ:

GEO. H. ELLIS.
F. H. GILSON.
GEORGE W. SIMMONDS.
J. EVELETH GRIFFITH.
R. E. SPARRELL.
SAMUEL USHER.
ASAPH CHURCHILL.

SCALE OF PRICES FOR PRESSMEN AND HOURS FOR LABOR AS AGREED TO BY BOSTON TYPOTHETÆ AND BOSTON PRINTING PRESSMEN'S UNION, No. 67, JUNE 4, 1910.

1. \$22 per week shall be the minimum scale for all cylinder pressmen.

2. \$17 per week shall be the minimum scale for job pressmen.

3. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 8 p. m., or later, one-half hour to be allowed and paid for as supper time; any part of an hour after 30 minutes to be paid as a full hour.

4. In the case of an employment of a night force, the 48 hours shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$24 for cylinder and Adams pressmen and \$18 for job pressmen.

5. The above scale of prices for hours and labor to be in force from June 1, 1910, to June 1, 1913.

For Boston Printing Pressmen's Union, No. 67:

JAMES J. REAGAN, *President*.
J. FRANK O'HARE, *Secretary*.

For Boston Typothetæ:

A. W. FINLAY,
Chairman Executive Committee.
A. N. MURRAY, *Secretary*.

SCALE OF PRICES FOR PRESS FEEDERS AND HOURS FOR LABOR AS AGREED TO BY BOSTON TYPOTHETÆ AND FRANKLIN ASSOCIATION, No. 18, JUNE 2, 1910.

1. \$15 per week shall be the minimum scale for male cylinder press feeders.
2. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 8 p. m., or later, one-half hour to be allowed and paid for as supper time; any part of an hour after 30 minutes to be paid as a full hour.
3. In the case of an employment of a night force, the 48 hours shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$17 per week.
4. The above scale of prices for hours and labor to be in force from June 1, 1910, to June 1, 1913.

For Franklin Association, No. 18:

MICHAEL S. COONEY.
DANIEL J. McDONALD.
JOHN J. CONNELLY,
ALFRED J. HARROLD.

For Boston Typothetæ:

A. W. FINLAY.
J. M. DUHIG.
T. A. HOULLAHAN.
H. P. PORTER.
H. M. PLIMPTON (O. E. B.).
HARRY A. WHEELER.

SCALE OF PRICES FOR PRESSMEN AND HOURS FOR LABOR AS AGREED TO BY BOSTON TYPOTHETÆ AND BOSTON PRINTING PRESSMEN'S UNION, No. 67.

1. Forty-eight hours, to be worked between 7 a. m. and 6 p. m., shall constitute one week's work.
 2. \$23 per week shall be the minimum scale for cylinder pressmen.
 3. \$18 per week shall be the minimum scale for job pressmen.
 4. \$24 per week shall be the scale for perfecting and two-color presses.
- (It is the understanding of the Boston Typothetæ scale committee and the scale committee of the Boston Printing Pressmen's Union, No. 67, that an Upham attachment is not a two-color press.)
5. Overwork, until 12 p. m., time and a half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 8 p. m., or later, one-half hour to be allowed and paid for as supper time; any part of an hour after 30 minutes to be paid as a full hour.
 6. In the case of an employment of a night force, the 48 hours shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$25 for cylinder and Adams pressmen and \$20 for job pressmen.
 7. The above scale of prices for hours and labor to be in force from June 2, 1913, to June 1, 1913.

Boston Printing Pressmen's Union, No. 67:

DANIEL J. SULLIVAN, *President*.
J. FRANK O'HARE, *Secretary*.

Boston Typothetæ:

A. W. FINLAY, *Chairman*.
JOHN M. DUHIG.
HENRY P. PORTER.
H. M. PLIMPTON & Co. (A. E. B.).
HARRY A. WHEELER.

SCALE OF PRICES FOR PRESSFEEDERS AND HOURS FOR LABOR AS AGREED TO BY BOSTON TYPOTHETÆ AND FRANKLIN ASSOCIATION, No. 18.

1. Forty-eight hours, to be worked between 7 a. m. and 6 p. m., shall constitute one week's work.
2. \$16 per week shall be the minimum scale for male cylinder press feeders.
3. Assistants attending one automatic feeding machine, \$16 per week. Assistants attending two automatic feeding machines, \$17 per week.

(The scale committee of the Boston Typothetæ and of the Franklin Association, No. 18, understanding of an assistant on an automatic feeding machine or machines is a person capable of setting or adjusting an automatic feeder, and feeding a cylinder press by hand.)

4. \$17 per week shall be the minimum scale for feeders on two-color or perfecting cylinder machines. Upham attachment not to be considered two-color presses.

5. Assistants on rotary and magazine presses, \$17 per week.

6. Overwork, until 12 p. m., time and one-half; after midnight, Sundays, and legal holidays, double time. When overtime is being worked until 8 p. m or later, one-half hour to be allowed and paid for as supper time; any part of an hour after 30 minutes to be paid as a full hour.

7. In the case of an employment of a night force of feeders, the 48 hours shall be made up so as to complete the time in five nights, and the minimum rate for such work shall be \$18 per week.

8. The above scale of prices for hours and labor to be in force from June 2, 1913, to January 1, 1918, and to continue for six months thereafter, until a new scale has been arranged to take effect June 2, 1918.

GEORGE K. BIRD.

[Paper submitted by George L. Berry, president International Printing Pressmen and Assistants' Union of North America, to the United States Commission on Industrial Relations, Washington, D. C., on the question of collective bargaining, conciliation, and arbitration between employers and the organizations of working men and women.]

The question of the proper relationship between employers and employees is one that embraces many important phases of industrial activity. It would be the height of presumption upon my part, therefore, to attempt to burden the United States Commission on Industrial Relations with my version of the necessary responsibilities of employers and employees. In conformity with the request of the commission, however, I prepared and submit herewith certain concrete views which I trust will be of assistance in the establishment of a more cordial and cooperative relationship between the units of industry in the United States.

The organized labor movement has for its basic principle the purpose of collective bargaining. It is apparent to all without minute explanation that it is decidedly more effective for all of the workingmen of a given industry to act jointly in the presentation of their grievances than it would be for each person to act individually in the matter, hence the existence of organized labor and its policy of economic advancement.

The collective interests of the employees bargaining with the collective interests of the employers is more desirable than the collective interests of the employees dealing with individual employers. This is so not only because of the prompt facilities that would follow in establishing the points at issue, but it is moreover essential because of the uniformity of action that invariably follows through joint bargaining relationship. For example, if a peaceful adjustment is not arrived at, a uniform cessation of relationship is followed; if on the other hand a mutual adjustment is made a uniform condition is established and maintained during the period of relationship, be it contractual or verbal, and this phase of the situation is of material importance to the units of the industry. By units I refer to employer, employee, and those dependent upon the industry for their livelihood. The main feature of importance, as I see it, evolves in the natural and inevitable competitive conditions that will follow.

Labor is the chief cost of industry; it is, of course, the most important phase of industry over and above its importance from a cost point of view, for the very fact that labor represents human effort, responsibility, and assistance. It is reasonable to say, therefore, that the matter of competition is of serious moment to the well being of the employees as well as the employers. If employers are to deal with their individual workmen either as union or non-union mechanics, then the condition of an unhealthy and unnatural competition must follow, for the characteristics of human nature have proven many times to be irregular, and irregularity in this sense would mean a diversified wage condition, which would further precipitate an irregular competitive cost for labor, which would still further establish an irregular base of cost and scale of competition. The organized labor movement therefore endeavors to maintain a living minimum wage with a view of protecting its members first, and second, protecting its industry against adventures therein, or that class of employers who make their profit from exploiting labor and who save their losses through the reduction of wages.

The question of the minimum wage as maintained by the collective action of working men and women, is a movement, as I have already indicated, that has for its purpose the establishment of a rate of compensation that would maintain the employees in an environment of respectability, and further, that every employer might at least be in possession of the fact that his competitor could not reduce the cost, labor, below the minimum figure established. Beyond those two points, organized labor then advances its cause upon the principle of increased efficiency and business cooperation. At least 65 per cent of the membership of the International Printing Pressmen and Assistants' Union receive a compensation in excess of the minimum established throughout their organization. This additional compensation over and above the minimum represents the degree of effort and the effect of the organization in the promotion of its general policies of increased efficiency.

For the foregoing reasons, primarily, statistics prove that in the commercial printing industry of this country particularly, where the organizations of the employees and the employers are jointly the strongest, the industry is more prosperous and the profits thereof more equitably distributed. On the other hand, where the workers are poorly organized, the employers are also disorganized, and the results are uniformly unsatisfactory from a business point of view. This condition is effective because of the small likelihood of combinations or corporations, it not being possible for a trust to exist in the commercial-printing industry.

In harmony with the general principles, as aforementioned, the best mode of procedure in the negotiation, the establishment, and the maintenance of agreements finds expression through international organization of working men and women and international associations of employers of a certain given industry. My statement in this regard is based on experiences we have had in our relationship with employers. With an international agreement covering a local society of employers and a local organization of employees there is a double means found in the establishment of responsibility. The international relationship of both organizations is more generally inclined to an adjustment of difference amicably than would possibly be the result if situations were left to local organizations of a contesting nature.

The International Printing Pressmen and Assistants' Union has at various times held international contracts with the United Typothetae of America, the American Newspaper Publishers' Association, and the Printers' League of America. The first and last named organizations of employers exercise organization activities in the commercial-printing industry alone, the American Newspaper Publishers' Association having its relationship with daily and weekly newspapers alone.

The contract with the United Typothetae of America failed to meet the requirements of the commercial industry—was not responsive to the interest of the industry—because the contract in the first instance was predicated upon a theory that denied the principles of collective bargaining or the maintenance of the principle of a community of interest. As has already been indicated by me, it is my opinion that there can be no equitable or amicable relationship or assurance of the conservation of our industry except through the assistance of the organized workers and their recognition by the employers. In the case of the United Typothetae of America's contract the employers insisted, and it was acceded to by the union for a number of years, that the contract should retain a clause in it that would give to the employers the right of discriminating against

a union man or a nonunion man as he might determine. If the organizations of the workers closed their doors against the nonunion workers, then there would be some justification for the idea as offered by the United Typothetæ, but the facts in the case are that organized labor expends more of its energy and income endeavoring to bring into its ranks the unorganized worker than through any other of its business operations. Its sum total purpose is to advance the principle of collective bargaining, community of interest, the increasing of efficiency, and the advancement of the industry as a whole.

The contract of the United Typothetæ failed because of its lack of community of interest; it failed because of the possibilities arising from specific provisions therein which made it optional with the employer to retain the services of union men or nonunion men as the employer might determine. In other words, such a contract could have but one effect, that of systematically destroying the organizations of the employees. This feature vitiated any possibility of mutuality and conciliation or arbitration under it and failed as result of that lack of confidence.

The Printers' League of America, which has succeeded in a measure the United Typothetæ of America as an employers' organization in the commercial industry, has profited by the experience of the United Typothetæ, and in the very first section of the agreement the broad principles of community of interest are set forth, and it reads:

"SECTION 1. In consideration of the Printers' League of America agreeing to employ none but members of the International Printing Pressmen and Assistants' Union to do work that comes under the jurisdiction of said International Printing Pressmen and Assistants' Union the Printers' League of America (and its branches) shall have the following guaranties:

"(a) All members of the Printers' League shall be protected under this contract by the International Printing Pressmen and Assistants' Union against walkouts, strikes, boycotts, or any other form of concerted interference with the peaceful operation of the departments over which the International Printing Pressmen and Assistants' Union exercises jurisdiction.

"(b) All disputes arising over scale provision, wages, hours and working conditions or renewing or extending contracts shall be subject to local arbitration under the provisions of this agreement, if such disputes can not be adjusted through conciliation.

"(c) The International Printing Pressmen and Assistants' Union shall at all times furnish sufficient competent help for the needs of the members of the Printers' League of America, but should it fail to do so, then, and then only until such time as the help required by the member or members of the Printers' League of America shall be furnished by the International Printing Pressmen and Assistants' Union, said member or members of the Printers' League of America shall be privileged to seek the necessary help elsewhere, provided that the prevailing scale of wages is paid.

"(d) The International Printing Pressmen and Assistants' Union further agrees that in cities where branches of the league are formed it will not permit its members to do the same class of work in nonunion shops except by mutual consent. Nor will it allow its members to work for a less wage scale or for longer hours than the scale and hours accepted by the branch league.

"SEC. 2. If conciliation between a local branch of the Printers' League and a local union fails, then an appeal to a local board of arbitration may be had as provided in the form of local contract recommended and attached hereto, and its decision shall be final unless appealed to the national board of arbitration, as also provided in said local form of contract. (Sec. 6-C.)

"SEC. 3. The national board of arbitration shall consist of the president of the Printers' League of America, or his proxy, and the president of the International Printing Pressmen and Assistants' Union, or his proxy. In the event of failure of the above board as constituted to agree upon an adjustment, they are then empowered to select a disinterested person who shall act as a member of the board. This board shall then proceed to render a decision as quickly as circumstances will permit and the decision so rendered shall in all cases be final and binding upon both parties to the controversy.

"SEC. 4. The national board of arbitration shall be under no obligation to take evidence, but do so at its option, but both parties to the controversy may appear personally or may submit records and briefs and may make oral or written arguments in support of their several contentions. They may submit an agreed statement of facts or a transcript of testimony, properly certified to

before a notary public by the stenographer taking the original evidence or depositions.

"SEC. 5. Pending final decision, work shall be continued in the office of the member of the Printers' League, party to the case, and all conditions obtaining before the initiation of the dispute shall remain in effect, and the award of the national board of arbitration shall in all cases include a determination of the issues involved, covering the period between the raising of the issues and their final settlement; and any change or changes in the wage scale of employees may, at the discretion of the board, be made effective from the date the issues were first made.

"SEC. 6. The national board of arbitration must act when its services are desired by either party to an appeal as above, and shall proceed with all possible dispatch in rendering such services.

"SEC. 7. All expenses attendant upon the settlement of any appeal or hearing before the board shall be adjusted in each case in accordance with the directions of the national board of arbitration.

SEC. 8. The rules and regulations in addition to the provisions above quoted shall be identical with those found in the recommendation for the form of local contract for the proper method of procedure and number therein under section 2, as 1, 2, 3, 4, 5, 6, 7, and 8.

SEC. 9. In the event of either party to the dispute refusing to accept and comply with the decision of the national board of arbitration, all aid and support to the firm or employer, or member or members of the union, refusing acceptance and compliance, shall be withdrawn by both parties to this agreement. The acts of such employer or member of the union shall be publicly disavowed, and the aggrieved party to this agreement shall be furnished by the other party thereto with an official document to such fact."

In every instance where controversies have arisen between locals of the International Printing Pressmen and Assistants' Union and locals of the Printers' League of America amicable adjustments have been the result. There is but one weakness that can possibly be cited against the contract of the International Printing Pressmen and Assistants' Union with the Printers' League of America, and that is the question of arriving at an adjustment in the event of failure to agree upon the third man of the national board of arbitration. I shall touch on this phase of the situation again before completion of this paper.

The contract of the International Printing Pressmen and Assistants' Union with the American Newspaper Publishers' Association, which has expired, met with the same general satisfaction as did the contractual relationship referred to above as existing between the International Printing Pressmen and Assistants' Union and the Printers' League of America. One great difficulty, however, and defect existing in the agreement with the American Newspaper Publishers' Association was found in the declination of many of the members of the American Newspaper Publishers' Association to join in contractual relationship. In other words, they retained their membership in the American Newspaper Publishers' Association, but refused to become parties to the contract in so far as it applied to relationship with the unions, and further maintained their right to participate in its construction. This fact to no small degree minimized the value of the contract between the American Newspaper Publishers' Association and the International Printing Pressmen and Assistants' Union. I am credibly informed that this defect exists in the relationship of the Publishers' Association with other international printing trades-unions.

The effect of the publishers' attitude, as indicated above, finds expression in the lockout of the web pressmen in the city of Chicago on May 1, 1912. This is possibly the most serious difficulty that has arisen in the newspaper industry for a great many years, and it was in no small degree due to the failure of the American Newspaper Publishers' Association to compel its members, the newspapers of Chicago, to act in harmony and come under the provisions of the international arbitration agreement with the International Printing Pressmen and Assistants' Union. For example, the local publishers of Chicago holding a local agreement providing for conciliation and arbitration for over two years succeeded in evading the demand of the union to go to arbitration looking to the advancement of a wage scale that had been effective for about seven years. The local publishers could very readily assume this position because of the lack of responsibility exercised over the local publishers by their national association. In other words, while the American

Newspaper Publishers' Association held a national contract with the International Printing Pressmen and Assistants' Union they permitted their Chicago membership to act individually, and at the same time the Chicago association was dealing with a subordinate body of the International Printing Pressmen and Assistants' Union.

The matter of procedure under the publishers' contract in conciliation, local arbitration, and national arbitration was in the main identical with that of the Printers' League of America contract already referred to.

The labor movement in general, and especially the printing trades-unions of America, stand committed to the principle of the adjustment of difficulties by the means of conciliation and arbitration. It is not the inclination or desire of the printing trades artisans of this continent to participate or precipitate in a strike or a lockout, or in any other concentrated movement that would involve the stability, success, and prosperity of the printing industry, and I am confident that the majority of the strikes and lockouts that have taken place in recent years in the printing industry have been more as the result of a misunderstanding than from any practical reason. The International Printing Pressmen and Assistants' Union is classified as being the most militant of the five international printing trades unions; the records show, however, that with the exception of the eight-hour-day campaign of 1907 there has been less than 20 strikes called throughout the entire jurisdiction of North American, with about 400 subordinate unions.

The best indication of the desire of the printing trades-unions for peaceful relationship with employers of the printing industry, and their willingness to embrace the principles of conciliation and arbitration, is conclusively evidenced in the recent international federated agreement entered into by the representatives of the five international printing trades organizations. This agreement is primarily a peace compact not only as it affects the relationship of the unions with each other but particularly as it affects the relationship of the unions and the printing industry. The fundamental principle of the federated agreement is predicated upon the idea of conciliation and arbitration. For example, the five international unions agree that where a dispute arises with an employer and a subordinate union of any of the five international bodies, representatives of those international unions are required to meet with the employer and endeavor to adjust the difficulties amicably by conciliation and arbitration. It has been further agreed by the representatives of the five international printing trades-unions that individual contracts made shall carry a clause providing that where a dispute arises between any of the subordinate unions of the five international organizations and where the employer refuses conciliation and arbitration, that then under such conditions the contract becomes null and void. This is the clearest indication of the real purpose of the proposed printing trades federated contract, and it is apparent to all that it rests upon the principle of peaceful relationship by and through the measures of conciliation and arbitration.

Reference has already been made in this paper to the difficulties that have arisen and the possibility of them in the future as regards the question of agreeing upon an unbiased odd member of arbitration boards. The possibility for delay in arbitration proceedings, and the experiences we have had as a result of delays in the past, have dissipated to no small degree the employees' confidence in conciliation and arbitration. This has been overcome somewhat, however, by advanced agreement that upon the settlement of a dispute the conditions arrived at should become effective on the date of the raising of the dispute. This arrangement, as I have already indicated, has in the main been voluntary. No specific requirement that this be a condition has ever been established in the printing industry; our agreements have only contemplated such a course if the arbitration board so desired.

From the result of international relationship with employers' associations I feel that strikes and lockouts and general disturbances in the printing and newspaper industry would be almost entirely eliminated by the establishment of an agreement that would contemplate the following:

First. An agreement jointly embracing all of the organizations of the industry and employers of the industry.

Second. The agreement to provide for conciliation, local and national arbitration.

Third. The agreement to carry a clause requiring that upon the opening of negotiations for an increase or decrease in wages, or the change of working

conditions, that such change arrived at should become effective from the date of the raising of the issue or from the inception of negotiations.

Fourth. That the contract carry with it a clause requiring the five international unions and the employers to render joint assistance in the maintenance of technical schools for the advancement of the industry and the increasing of efficiency of the units therein.

Fifth. That the contract provide a board of general review representing the organizations and the employers of the given industry whose authority it will be to pass upon the matter of differences that fail of adjustment by conciliation and arbitration. The chief purpose of this provision is to make possible a further effort to arrive at an amicable settlement, and if then failure results, make possible the placing of the responsibility upon the party guilty of an unfair attitude.

The provisions as outlined above, in my opinion, will minimize to the lowest possible degree difficulties that have heretofore brought about the cessation of business; it would, on the other hand, increase the community of feeling; would harmonize cooperation and advance the commercial possibilities of the industry to a point more responsive to the requirements of those engaged in it. The further effect of such an arrangement would very quickly establish the fact that the success of the industry is essential to the employee as well as the employer.

There is but one additional suggestion that I could make, and that is in harmony with the assumption that the United States Commission on Industrial Relations is either to have a permanent existence or from it a board is to be established as result of its investigations that will have for its purposes the furtherance of industrial peace and justice.

It is not compatible with the interest of free and voluntary organizations to suggest the practicability of compulsory arbitration; such a system would fail miserably, as has been the result in practically every instance where it has been given a test. It is my opinion, however, that if the duties of this commission were broadened or some industrial board of the future was given the authority to investigate into industrial differences before or after a dispute, and preferably before, to exert efforts to prevent difficulty and to maintain a voluntary board to act where the contesting parties have failed to agree in the completion of an arbitration board, you would find that not only would the great majority of such disputes be presented to the Government board, but you would see in this further arrangement looking to peace, another substantial reduction in wasteful industrial conflicts.

The organization of working men and women can not fail in its efforts to maintain an organization. The efforts of employers to destroy organizations of working men and women therefore constitutes a policy of destruction rather than construction. Organized labor's willingness, as a general proposition, and with a growing tendency toward conciliation and arbitration, is manifestly sufficient in importance to justify the Government offering its persistent efforts and influences toward industrial peace and justice.

GEO. L. BERRY,

President International Printing Pressmen and Assistants' Union.

APRIL 7, 1914.

BUILDING TRADES.

PRINCIPLES AND PLATFORM ADOPTED AT THE NEW ORLEANS CONVENTION OF THE NATIONAL ASSOCIATION OF MANUFACTURERS IN 1903.

(1) Fair dealing is the fundamental and basic principle on which relations between employees and employers should rest.

(2) The National Association of Manufacturers is not opposed to organizations of labor, as such, but it is unalterably opposed to boycotts, black lists, and other illegal acts of interference with the personal liberty of employer or employee.

(3) No person should be refused employment or in any way be discriminated against on account of membership or nonmembership in any labor organization, and there should be no discrimination against or interference with any employee who is not a member of a labor organization by members of such organization.

(4) With due regard to contracts, it is the right of the employee to leave his employment whenever he sees fit, and it is the right of the employer to discharge any employee when he sees fit.

(5) Employers must be free to employ their work people at wages mutually satisfactory without interference or dictation on the part of individuals or organizations not directly parties to such contracts.

(6) Employers must be unmolested and unhampered in the management of their business in determining the amount and quality of their product and in the use of any methods or systems of pay which are just and equitable.

(7) In the interest of the employees and employers of the country no limitation should be placed upon the opportunities of any person to learn any trade to which he or she may be adapted.

(8) The National Association of Manufacturers disapproves absolutely of strikes and lockouts, and favors an equitable adjustment of all differences between employers and employees by an amicable method that will preserve the rights of both parties.

(9) The National Association of Manufacturers pledges itself to oppose any and all legislation not in accord with the foregoing declaration.

REPORT ON DEFINITIONS OF METHODS OF PAYING LABOR.

[Sanford E. Thompson, consulting engineer, Newton Highlands, Mass.]

Piece rate: A price is fixed for each unit quantity of work, regardless of the time it takes to perform it.

Premium and bonus are used in a broad sense to denote any reward above the daily wage.

The Halsey premium plan establishes a time for doing a piece of work based on records of past performance or fixed by estimate. If the work is finished in less time than this base time, the saving in wages is divided and a part, usually one-half, is given to the workman.

Task setting consists in fixing by scientific study the time that should be necessary to do a piece of work at a speed not injurious to the workman and with a reward over and above day wages offered for the accomplishment of a piece of work in or within the time specified. The reward may be figured in various ways, as follows:

In the bonus system a man is guaranteed his regular day rate, but earns nothing in excess of this unless he accomplishes the job in the task time, and in this case he receives in addition to his day wage a substantial bonus, figured as a percentage (usually at least 30 per cent) of this wage. If he finishes his job in less than the task time, he receives a further reward, the amount of which varies with different plans of payment.

When the premium system is used in scientific management, as at the Watertown Arsenal, the premium time is made, say, 66 $\frac{2}{3}$ per cent larger than the task time (as defined above) and, as in the Halsey plan, if the job is finished in a shorter time than this, the worker receives a reward equal to half the saving. It differs from the Halsey plan in having the base time fixed by scientific standards instead of by estimate.

With the differential piece rate a man receives a higher price per piece if the work is done in the standard time without imperfections than is paid if it takes a longer time or if the product is imperfect. Suppose, for example, that the standard time requires a man to do 20 pieces in a day. If he finishes these 20 pieces, all perfect, he receives, say, 20 cents per piece, or \$4. If, however, he finishes less than 20 pieces, instead of 20 cents per piece, he may receive 16 cents per piece. Thus, for 19 pieces he would receive \$3.04.

EFFICIENCY SYSTEMS AND LABOR.

COMMISSION ON INDUSTRIAL RELATIONS.

WASHINGTON, D. C., *Monday, April 13, 1914.*

The commission met at 10 o'clock a. m. in the assembly room of the Shoreham Hotel.

Present: Commissioners Frank P. Walsh (chairman), John R. Commons, Mrs. J. Borden Harriman, Frederic A. Delano, Harris Weinstock, S. Thruston Ballard, John B. Lennon, James O'Connell, and Austin B. Garretson.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. B. M. Manly, superintendent Division of Industrial Investigations; and Mr. F. H. Bird, superintendent Division of Public Agencies.

The CHAIRMAN. The commission will please come to order. On the hearing on efficiency systems and labor I have but one general suggestion to make, and that is that so far as possible the subject be confined to the question of the relations that arise naturally between employers and employees in the application of efficiency systems or scientific management.

I would be glad to have the witnesses who are present kindly take seats on the first-row chairs to the right and attend as far as possible the hearing, so that each witness as he testifies may be heard by the other witnesses.

The first witness on the calendar for to-day is Mr. Frederick W. Taylor, of Philadelphia.

Mr. Thompson, you may proceed with the examination.

TESTIMONY OF MR. FREDERICK W. TAYLOR.

Mr. THOMPSON. Mr. Taylor, will you kindly give us your full name and address?

Mr. TAYLOR. Frederick W. Taylor; Chestnut Hill, Philadelphia.

Mr. THOMPSON. What is your business, Mr. Taylor?

Mr. TAYLOR. Consulting engineer. I, however, have given up all work for money, for pay. For the past 12 years all the work I have been doing has been done not for pay, but, if I may say, in the interest of scientific management, trying to further the cause of scientific management.

Mr. THOMPSON. You may state briefly, if you will, what your experience was before that, and then a little more fully as to what you are doing in carrying out this work for which you receive no compensation.

Mr. TAYLOR. I received my preliminary education in Germantown, where I was born, near Philadelphia, and went abroad for three and one-half years, and was at school in Paris and Berlin and Stuttgart and Italy, and returned and went to Phillips-Exeter Academy, and entered Harvard University. My eyes broke down and I was obliged to work for seven years as an apprentice; I served two apprenticeships, and then went to the Midvale Steel Works as a laborer, because I could not get employment as a mechanic, and went up through the Midvale Steel Works until I became chief engineer and manager of the works. Then I left the steel works, because I believed there was a larger field of usefulness in introducing the principles of scientific management into other establishments.

From that time until I retired in 1901, I was engaged in systematizing and introducing the principles of scientific management into various industrial establishments. Since that time I have been attempting to help a good many of my friends to introduce the principles of scientific management in industrial establishments, helping them by teaching them, and by, so far as is possible, giving men the opportunity to work in establishments which are introducing scientific management. That has been my work since then.

Mr. THOMPSON. Do you maintain an office and a force?

Mr. TAYLOR. I have an office with a private secretary, but I have no money-making establishment of any sort, and no affiliation or connection with any money-making affair of any kind.

Mr. THOMPSON. Do you educate other people in your system, or do they educate themselves by reading your books?

Mr. TAYLOR. For a good many years past there have been quite a number of men who were very competent, men who showed ability in this direction, whom I have been teaching and helping to learn scientific management. My part consists largely in securing the opportunity for them to work in various establishments, and where they can not afford to do without the salary I have paid the salary of quite a number of them for several years while they are learning the introduction of scientific management. I may say that every cent of my surplus income, and a little more, for a good many years has gone into the cause of scientific management.

Mr. THOMPSON. Then your work in that matter is really a work of social welfare and advancement?

Mr. TAYLOR. Well, I am asked continually to contribute to charities of various sorts and my universal answer is that I do not conceive there is any charity to which I could devote my money that would compare in any way with the good that is done by scientific management. My reason for that is that as many as a thousand or two thousand men annually come under the principles of scientific management, who automatically receive an increase of from 20 to 100 per cent in wages, and who become the best friends that their employers can have. That is to say, instead of being enemies of their employers, they become their warm, firm friends, and they enter upon careers of prosperity and development such as they never have had an opportunity to have before. That is largely brought about by the effort of men who are capable of going into the old type of establishments and guiding and directing them during the change from the older to the newer type. So I feel that every cent and every minute that I can put into that, while it may not be a charity, is certainly accomplishing more for my friends, the workmen, than anything else I could do. And I want to make it perfectly clear, because I do not think it is clear, that my interest, and I think the interest of every man who is in any way engaged in scientific management, in the introduction of the principles of scientific management, must be first the welfare of the workmen. That must be the object. It is inconceivable that a man should devote his time and his life to this sort of thing for the sake of making more money for a whole lot of manufacturers. Incidentally it is impossible—anyone who has any sense and who has lived in the world knows that it is impossible—to do the one without doing the other. You must make their interests mutual. And I may say that I would not devote 5 minutes of my time to this if it were not for the workmen. What I am working for is for this increase in prosperity and happiness and wages, and particularly in the friendliness of the working people toward their employers. That is my chief work.

Mr. THOMPSON. You have been invited to come here and present your ideas in the form of testimony with reference to efficiency systems and labor, teaching men how to work in the carrying out of efficiency systems. What have you to say on that subject?

Mr. TAYLOR. I have a great deal to say if the commission would like to listen.

The CHAIRMAN. That is good. You may proceed.

Mr. TAYLOR. I would suggest that if I may be allowed to do so I be given time to set forth the general principles of our system and its relation to the workmen without answering any questions until the subject is rounded out. If the gentlemen will kindly make notes of questions they would like to ask, they will find that 9 out of 10 of them will answer themselves automatically. So it will save a lot of questioning if you will write down the questions and ask them all at the end. I do not want to dodge questioning. I welcome it, and I would rather have the questions than to say what I am going to say, but in order to eliminate a very large number of questions, I would suggest that I be allowed to talk without interruption until I have told the story, so to speak.

The CHAIRMAN. Very well. You may proceed in that way.

Mr. TAYLOR. I am going to talk about workmen, to generalize about workmen, and I hope I can make myself clear at the start that in what I say of workmen I have in mind only that limited class of workmen who are engaged in what may be called coordinated industries, not the workmen who are engaged in isolated work; because it is very important to make that dis-

tion. The generalizations which apply to that class of men do not apply to the isolated worker. They do not apply to the gardener, the coachman, or to the man who is doing work for his own account. So I am going to generalize about workmen a good deal; and, again, let me say that in talking as briefly as I am about to talk, I have to state broad truths which, of course, are subject to a vast number of exceptions. I do not mean to be dogmatic and to neglect those exceptions, but I do mean, in what I have to state, to state broad truths. Please bear that in mind, because otherwise what I am going to say will sound ridiculous and, in some cases, preposterous, because there are so many exceptions to the rules.

As I conceive it the most serious fact that faces the industrial world to-day—not only in this country, but all over the industrial world—is the broad fact that the average workman believes it is for his interests on the whole to go slow, to curtail the output rather than to turn out as much work as he can each day. Workmen throughout the civilized world are firmly convinced that it is for their interest to go slow instead of going fast. That is, I conceive, the saddest, the most unfortunate fact in industry to-day. There are two great causes for that in the minds of the workmen. The first is, that if you will take any trade, I do not care what it is, and suggest to any set of workmen in the trade that it would be a good thing for them to double their output in that trade, they will say right away, “I do not know anything about other people’s trades, but I do know that in my own trade there can be but one result from doubling the output—that is, that half of us would be thrown out of a job inside of a couple of years. That is all that would happen in our trade.” That fact is so self-apparent to the average workman that it does not admit of an argument and you can not reason with him about it. He says, “My dear boy, I do not know anything about other trades, but in my trade half of us would be out of a job if we were to double our output.” That settles the whole question as far as that man is concerned. You can not argue with him.

Not only that, but I find that doctrine is very largely believed in by my friends—the leaders of the labor unions. They are firmly convinced that that is true. I find not only that, but that a great majority of men who are well read with relation to industrial matters, and well read with relation to the history of industry, will say the same thing and will reach the same conclusions. They will say it is almost an axiomatic fact. And, yet, gentlemen, I ask any one of you to point out a single instance where that has happened. I have never yet been able to find out a single instance. If any of you have found it, I wish you would point it out. I have yet to find a single instance in which exactly the opposite has not been true. In every instance the introduction of labor-saving machinery—never mind if it could result in turning out twenty times the amount of work that was formerly turned out, never mind what has come in which has increased the output—I would be glad to have anyone point out a single case in which the result of that increase has not been to make more work for more men in that trade. It has never thrown men out of work except temporarily—right in the first three or four months, perhaps. The effect has invariably been to make work for more men in that particular trade in every case. I have never yet had a case pointed out in which that was not true. I am looking for a case, and I am hoping that some one will point out such a case.

That sounds like an extraordinary fact. How can the introduction of labor-saving machinery keep on making work for more men in every trade?

There is one trade in which that is not true, if you choose to call it a trade, or one occupation, and that is the occupation of farming.

One hundred years ago it took 80 per cent of the world’s workers to feed the world. To-day it takes 36 per cent of the world’s workers to feed the world. It is from this great farming population that the men are coming to the trades, and the more you introduce labor-saving machinery, the more you do in the direction of increasing it. The more men that come from the farms to the industries—the more men devote themselves to that side of the work. That is the history of industry, and it is a very significant fact. It is such a vital fact that I think that every man who has a knowledge of the matter, who has any interest in the working people of the world, ought to realize that when any device comes along which makes for the increase of efficiency, it enables the same number of workmen to turn out a larger amount of work, and that instead of injuring the workmen or throwing them out of work, it is on the way to create more work for the men in that

trade. That is the universal history of industry. But there ought to be at least one illustration, because, after all, my say so amounts to nothing. Let us have one illustration of this fact, because, after all, illustrations are what count, and not somebody's notions, theories, talks, or generalizations.

Take the cotton industry, for instance. In 1840, or thereabouts, broadly speaking, 1840, the power loom superseded the old hand loom. The power loom was invented 50 years before, but at that time inventions were very slow in being introduced. About 1840 it came into Manchester, England. There were at that time in Manchester 5,000 weavers, and those men knew what the loom was going to do, that it would turn out three times the work that they had been turning out in the past, and they knew that after the power loom was introduced, instead of there being 5,000 weavers in Manchester there would be only 1,500 of them left. Gentlemen, realize that at that time the immobility of labor was something appalling. A man was born in the trade, and he lived in the trade, and he died in the trade. He was born in a town, and lived in a town, and never moved out of that town until he died. That was the rule. You will remember the laws that were made only a little time before that prohibiting the migration of workmen from one county to another in England, so that labor was exceedingly immobile; and these weavers, when they saw this power loom coming, saw themselves and their families facing starvation. Put yourselves in their place. Before we judge harshly of any set of men, we should put ourselves in their environment. I am not defending arson or murder, or anything of that sort, but I want you gentlemen to put yourselves in their places before you judge these poor fellows too harshly. What they did was to break into the establishments in which the power loom was coming, to smash the looms and to burn the establishments, and to beat up the scab, and to do everything possible to stop the introduction of that power loom. I do not blame them. You and I would have done the same thing, or if not the same thing, then the same thing in kind, for broadly speaking, we would have fought for our lives and families; so that I want you gentlemen not to condemn these people too severely. It was in kind what you and I would have done.

What was the effect of their fight against the introduction of the new labor-saving machinery? Just what it always has been, just what it always will be. It was nothing. The power loom came right along. I am not sure its introduction was not accelerated by the fight. I am sure that in many cases opposition to the introduction of labor-saving machinery accelerates its introduction. I am sure that the opposition to the introduction of scientific management has accelerated its introduction, and not retarded it in the least. It has gone on far more rapidly since the opposition became more acute than before, and it will be so.

If scientific management is designed for increasing the efficiency of men without materially increasing their effort and without overworking men, then, mark my words, any opposition, from whatever source, however powerful and whatever it is, will merely increase the rapidity of its introduction. That is the history of industry.

I predict the same thing for scientific management, if what I say is true, and if it is not true, it is going to fail, and ought to fail. That is the history of industry.

The power loom came. Let us see what happened. Less than 100 years have gone by. The population of England in that time has certainly not more than doubled, and for every man engaged in the cotton industry in Manchester now there are 10 yards of cloth produced to 1 yard that was produced before the introduction of the power loom, which is before this fight in 1840. Ten yards are coming out now, to every man in the industry, for one that was turned out before 1840. There were 5,000 weavers in Manchester, England, in 1840. There are now 265,000. Has that thrown men out of work? Has the introduction of labor-saving machinery thrown men out of work? Two hundred and sixty-five thousand men are working there now where there were 5,000 in 1840, and each of those 265,000 men is turning out at the very least 10 times the yardage of cloth turned out in 1840. Multiply that, and you will find that for every yard that went out in 1840 there are at least 500 yards of cotton that go out to-day, and that is the history of industry. That is an illustration of why the world is making progress. That is an illustration of why the workmen of to-day live so much better than they did some time ago. I have got lots of them who are my friends, I have lots of them into whose homes I go, the families of mechanics, and I know that they live

better than kings did 250 years ago. They have more luxuries, and more that is fine in life, than kings did 250 years ago. What is it due to—this increase of output? All of that goes to luxury, leisure, art, culture, because of this increase in output. That is the source of it. It gives them the opportunity for it.

What is the fundamental meaning of this? There is something back of this output in cotton. What does it mean? It means two things, that all you have to do in this world is to bring true riches into the world, and the world uses them. That is the fundamental meaning. All you have to do is to create riches and bring them into this world, and the world uses them. Think of it, 500 yards of cotton cloth now being manufactured and turned out at Manchester, England, to every 1 in 1840! We do not think of the fact that in 1840 cotton goods were a luxury, to be used only by the rich people, that the poor people wore ragged woolen goods. What possibly has become an everyday necessity, an absolute thing of necessity to all of us, at that time was the greatest kind of a luxury; and that is what is going on all over the world. That is what is going on in every industry throughout the world—this change from rank luxury in one generation to what becomes absolute necessity in the next; and I am looking forward, through this same increase in output, to the fact that 100 years from now the working people are going to be living just as well as merchants live now, just as happily; and what is it coming from? This increase in output, and nothing else. I am dwelling on that, because, after all, the greatest source of opposition to the introduction of scientific management is because the working people are afraid of throwing people out of work. They are afraid that through scientific management people will be thrown out of work. That is the greatest reason for the main opposition to scientific management.

I want to call attention now to one thing, and that is that the working people are in no way to blame for this opposition. I want to know who is bringing these facts to the attention of the working people of this country? You gentlemen live in various cities. What man in your city has talked to them and told the working people what I have been telling you now? On the contrary, their leaders, honest men, straightforward men, but simply badly educated men, men who have not looked into their own trades, are telling them the opposite thing and they are suggesting the strictest legislation in almost every trade-union, in the interest of the trade, for fear some one will be thrown out of a job, in order to maintain the prices, and for various reasons. There is hardly a trade in which there has not been restrictive legislation enacted, in which there has not been suggestion of it. Who is telling to the working people what I have said to you now? I do not know who it is. Who is pointing these facts out to them? Gentlemen, if you would go to England and if you would look at the condition there you would find that it is something frightful. I am heartily in favor of a redistribution of wealth, to a certain extent. I believe, to a certain extent, there is too much wealth in certain hands and too little in other hands. I am heartily in favor of that, but when it comes to the socialistic legislation that is going on in England, it is doing nothing. It is doing nothing; it is putting a little bit of a plaster on the outside. The great fundamental fact in England is that every workman in England is born to the fact that he must curtail the output if he is going to do his duty to himself and his kind.

What do you think of it? Just think of it! I have a magazine published last August containing an article by Ellis Barker, one of the greatest statisticians of England, in which he gives 30 American trades and English trades in which the output of the average American workman is shown to be more than three times that of the English workman. The English workmen are just as good as our workmen are. I have run up against them and I know they are just as good as our men. But they have that restriction of output; the unions have had such control for such a length of time there—but in an absolutely misguided way and absolutely through misunderstanding—that they have restricted the output to such an extent that those poor fellows over there turn out only one-third of what our men are able to turn out. How can they get wages—not so much wages, but how can they get food, the luxuries of life, and even the ordinary necessities of life when they are only turning out one-third of the output?

Wealth comes into the world from no other source. It is what these men produce that constitutes the wealth of the world, and no amount of juggling, no amount of legislation, no amount of anything else, will ever give that wealth to the people unless these men produce it. You have to bring it into the

world and give it to them, and yet they are refusing to bring it into the world. They are robbing their own kind, because nineteen-twentieths of the wealth of the world is consumed by the poorer people and one-twentieth of the wealth of the world is consumed by the rich. All the poorer people are suffering, and they will as long as they fail to get these good things, and it will not be the rich people who will suffer. That is what the poverty of England is due to to-day, and that is what Barker points out. I have known isolated facts; in every industry I have looked into myself I have found that in comparison with England we are producing three times as much, and I went further than Ellis Barker and have looked into many instances, and have gone into the work-rooms of these people, and these poor fellows are deliberately soldiering, deliberately restricting output and doing it conscientiously because they believe it is for the good of their kind. There is nothing dishonest about it as they see it. It is merely a bad instruction, merely that they do not know what they ought to be doing for their own interests. They have never been properly educated.

What is the end of this? It is horrible when you think of it. What is the ultimate effect of this restriction of output? It means the people in England who have passed 65 years of age are living on less than \$2.50 a week. That is the outcome of it all. Two-thirds of the people who are past 65 years of age are living on less than \$2.50 a week. That is due to restriction of output, and you may legislate all you please for redistribution of wealth; but until in England they climb up and do a proper day's work and do what they should do by turning the entire thing over, they will never get wealth, they will never get the luxuries, and they will not even get the necessities.

What I want again to emphasize is that the working people are not to blame for this.

The second cause is this: If you are making a pen like this [indicating], let us consider what the situation is. Let us assume that a pen like that can be made by a single man. It can not, of course, but let us simply assume that one man can make a pen like that. He is making 10 pens a day and getting \$2.50. If he has any kind of a foreman, that foreman is the sort of a man who sympathizes with his men and wants them to prosper and he will say to this workman, "You are making 10 pens a day; you are getting \$2.50 a day. Why not make them by the piece?" The man will say, "That is first rate; I will be delighted to do it." At the end of the year, the workman, through his own exertions and the help of his foreman and friends who have been around him, through his own ingenuity and through the incentive that is offered him, finds himself turning out 20 pens instead of 10. That is a very common and usual thing, not at all unusual. The workman is delighted, because he is getting \$5 a day where before he got \$2.50 a day. The workman is pleased, because he has doubled his income. The foreman is pleased because he has doubled the output of his shop with the same number of men.

Everybody is pleased except some member of the board of directors. I have been a member of boards of directors, and I imagine that some of you have likewise been members of boards of directors. We must not condemn this man, because he thinks it is his duty to do it, but some member of the board of directors calls for the pay roll, and to his horror he finds that a lot of his workmen are getting \$5 a day, whereas the ruling rate of wages for workmen of that kind in that community is \$2.50. I have seen that over and over again. It is a shock to that man. It is a genuine question with him; from his viewpoint, we are ruining the labor market in our part of the country. He will say that Washington can not compete with other places because we are paying \$5 a day and the rest of the country paying \$2.50 a day. It is perfectly self-evident to that man, or he thinks it is. It is a fallacy, but he thinks he is right. He sends for that foreman and wants to know the reason why those men are paid \$5 a day when similar men in a similar occupation in other parts of the country are paid \$2.50, and he is told he must stop ruining the labor market of Washington. That foreman, with sadness—if he is any kind of a man, and in nine cases out of ten he is—is utterly disgusted, but is obliged to reduce the men's piecework prices until he finds himself turning out 20 pens a day and only getting \$2.75, if he is liberal, or \$3 a day, where he only got \$2.50 before. That is what takes place all over the country under the piecework system; that is the piecework system. Those of you who have worked under it know it. Those of you who have been bosses know it. That is the system of the world in piecework. I am not blaming the people, because there was not for a long time any other system or any better system than that. There was no alternative. That was all they could do.

Just let me tell you one thing: There are a great many people who question the honesty of the workmen, who debate whether they are not deteriorating in this country, etc. Whatever your views as to the honesty or dishonesty of the workmen, my personal experience with them has been that they are just as straight, just as praiseworthy as any other class in the community—not more so; not less so. I have been among them and have worked with them for many years, and I have as many friends among them as I have in any other class. That is my personal experience, and whatever your opinion be on that point, whatever your views may be, just put one thing right down: Whatever the workmen of this country are or are not, they are not damned fools. That is straight. They may be a lot of other things, but that they are not. It just takes one cut like this—just one—to make them soldier for life. Who can blame them? They start deliberately and soldier for life, and it becomes a set habit with them. I did not even have to have it before I started to soldiering. I never got my cut. I was too keen. The boys informed me beforehand, when I was an apprentice. When I came into the work I began soldiering without being cut and without being told. We were all intelligent boys; we were all good boys. I do not know that I got a cut all the time I was working. I was very careful. I watched that clock with a very great deal of care, and if I could have turned out 20 times the work I was doing, and if that was the basis, I watched that just as everybody else watches it—and you can not blame them. I was wrong. It would have paid me and the other people much better to have taken our cut and gone right ahead. It is a good deal to ask of a human, however—to ask anyone to accept that cut and smile over it and think it is a good thing for you.

The working people are not to be blamed for that, nor are the employers to be blamed. Hundreds of employers who have to do that deplore it. Their foremen deplore it and their superintendents deplore it. Everyone who is cutting these wages deplores it. It is a sad fact in industry. It is not something that anyone is proud of. I have yet to hear the first man who is proud of it on either side. But there is no better way than that.

What I want to emphasize is this: I want to call your attention to this, because this is perhaps the most important, or one of the most important, facts connected with scientific management. I want to emphasize the fact that the very first step that was taken toward establishing that state of principles which have come to be known as scientific management was taken in an earnest endeavor to correct this evil of soldiering. That is what led to the first move toward the introduction of the principles that have come to be known as scientific management. Gentlemen, every subsequent step that is taken in the introduction of these principles was taken in exactly the same way—not as a theory which someone propounded; not that someone said, "Here is a new idea or scheme or plan," or whatever it might be that might be a good thing to try; not at all—but because there was a crying evil existing in the whole system, palpable and present, and because as the endeavor was made to correct that evil and to correct that existing evil, so that at every step scientific management has been an evolution and not a theory. I want to emphasize that, because every man who has had much experience in this world must be profoundly suspicious of every new theory, and I do not care what that theory is—his own as well as everyone else's—he must be profoundly suspicious of it.

For my own part, whenever I have a new theory, whenever I evolve a new theory, and it has not been tried out and tried out and tried out, whenever I have made a new invention—and I have taken out probably 100 patents—whenever I take out a new patent or develop a new invention of any kind, I say to myself in the enthusiasm of the moment, "By George, that is the finest thing that ever happened; that is a remarkable invention, and it has got to be patented right away." So I proceed to patent it. After the enthusiasm subsides a little bit, then I say to myself, "Freddy, my boy, doubtless this is the most remarkable thing that ever happened in industry, particularly in this branch of industry, but probably the fact is, dear boy, that it is just like the other ninety and nine; it is not worth a damn." That is what I have to say about my own theory and what I say about the new theory of everyone else that comes along.

I do not want anyone to confuse scientific management with the new set of theories that are being formed. No one ever reasoned out the theories of scientific management until it had been in use for probably 20 years; no one ever thought that there was a new set of principles. It came as a development of one thing after another, and gradually a set of principles grew up which differed radically from the older principles. No one took pains to analyze those

principles and get to the bottom of them until after they had been in use for 18 or 20 years. Then we began thinking—to analyze them. We said to ourselves, "Here, a new thing has taken place. What is this?" I want to emphasize that it is an evolution and not a theory.

Scientific management exists in a very large number and variety of establishments, and it is safe to say that in the average establishment where scientific management exists the workmen are turning out twice as much work per man as they were before. That is in the average establishment. In many, of course, they are turning out much more than that, and in some few, less than that, but in the average establishment men are turning out about twice as much work. The output of the establishment has been doubled. That has resulted in an increase in profits and the companies have profited by it. It has resulted in many cases in lowering the selling price, so that the general public has gotten something out of it. But, gentlemen, let me tell you that in the end neither the working people nor the manufacturers are going to get much out of it, that is, a hundred years from now. The general public is going to have it all. The whole world will have it. That is the history of industry. For a while the manufacturer has gotten the most out of it. Then comes along the workman in that industry, and he gets some of it, but very soon the whole general public gets it all, practically speaking. That is the history of industry.

Let me, however, digress here and point out one fact which has not been generally appreciated, and which ought to go to the credit of scientific management; a very important fact, that this is the first instance in the history of industry in which the introduction of labor-saving devices has been done by men who have insisted from the start that the workmen should at once get their share. The men who have introduced scientific management have insisted that the workmen should get an increase in wages. In the introduction of labor-saving machinery formerly the manufacturer has got it all, at the beginning. Every man who comes under scientific management gets automatically an increase of from 33 per cent to 100 per cent in wages at once. This is the first case in industrial history in which that has been true, so far as I know.

There may have been isolated cases that I do not know of, but certainly there has been no general movement. Certainly that has not been characteristic of the introduction of labor-saving machinery, as you all know. In many cases the first effect of the introduction of labor-saving machinery was perhaps to lower wages, because a cheaper type of man was able to run the machine, in some cases. Of course, in the end the whole world profited by it. But in justice to scientific management I want to emphasize the statement which I have just made, that from the start the people who have introduced it have insisted that the workmen should at once get an increase in wages. The owners of the business have a larger profit, the general public shares in the profit, but without any question the workmen have gotten the greatest good that has come under scientific management. There is not the slightest shadow of doubt about that. As I said before, the very moment that workmen come under scientific management, where a man goes from an establishment right next door into one of our establishments, he gets an increase of from 33 to 100 per cent in wages, depending on the character of his work, and that happens right away. That is worth while; and yet without any hesitation I say it is not the greatest gain that comes to workmen under scientific management. The greatest gain that comes to them comes from the fact that they come to look upon their employers as the best friends they have in the world. That is the greatest gain that comes to them under scientific management. Under the old type of management there is suspicious watchfulness, and a guarding of their own interests is absolutely necessary. They look upon their employer as perhaps a pretty good fellow, but they say, "You have got to watch him; he is human and likely to grab for more than his share." But under scientific management this suspicious watchfulness entirely ceases, and workmen come to look upon their employers as genuinely the best friends they have in the world. That, of course, sounds like a broad statement and very difficult to substantiate, but let me give you some proofs.

In the 30 years in which scientific management has been introduced, there has never been a strike of men working under scientific management. There have been a few strikes of men who were coming under it, but there has never been a strike after the new system has been introduced, after men have come to work under the principles of scientific management. While they were

in process of coming in there have been a few strikes, but only a few, and never a case of a strike where men were working under scientific management; and you can not have a strike. Why is that true? Because the essence of the matter is friendship. Scientific management can not exist without friendship being its characteristic. There is no possibility of it. The moment you have enmity scientific management evaporates into the air and there is no such thing.

What is scientific management? I want to sweep the field clear first by pointing out what it is not. First, I will point out a lot of things which scientific management is not, because I find there is a very great misunderstanding as to what it is.

Scientific management is not any efficiency device, nor is it any group of efficiency devices. It is no part of the mechanism, nor any part of the schemes which are ordinarily looked upon as scientific management.

Scientific management is not any new pay system, it is not any new scheme for paying men. It is not a piecework system.

Scientific management is not time study. It is not functional or divided foremanship. It is not any new cost system. It is not the printing and unloading of a ton or two of blanks of printed matter, and saying "There is your system; go ahead and use it." It is none of those things.

I am not sneering at a new pay system, or at a bonus system or a piecework system. They are useful. Some of them have been developed under scientific management, as some of the elements of scientific management. But they do not consist of scientific management. Your whole system is new. Scientific management can not exist, and does not exist, until there has been a complete and entire mental revolution on the part of the workmen as to their duties toward themselves and toward their employers, and an equally great mental revolution on the part of employers toward their duties to their workmen. Until this great mental change takes place I say there can be no such thing as scientific management. That is an absolute necessity. You may have all the mechanism, all the forms of it, you may have your bonus system and your time study, but you have not got scientific management until that change has taken place.

Now, I want to point out just one illustration of this. I do not want to leave that there, because this general talk is so cheap—any one can do it. I do not want to leave you without some illustration of what I mean by this mental change that takes place on both sides. Again taking the illustration of this pen, if you are manufacturing this pen, there is a certain amount of material that goes to make up the cost of that pen, and then added to the material you have to add a certain percentage of overhead expense, what is called overhead or general expense, the proper share of taxes, insurance, depreciation, and salaries of the officers of the business, the superintendence, and what is ordinarily called unproductive labor. All those items of the indirect expenses have to be prorated onto that pen.

If you will add those items together, the cost of materials plus the cost of general expenses, that makes a sum of money. Subtract that from the selling price of this pen and you have what is called the surplus; and as you all know, it is over the division—mark my words—it is over the division of this surplus that all the labor disputes have arisen in the past. The eyes of employer and employee alike have been on the division of that surplus. The workman naturally wants all he can get of it in the shape of additional wages or in the shape of shorter hours, or in the shape of better working conditions. He wants all he can get out of the surplus. It must come out of that. It can not come out of anything else. The manufacturer wants what he looks on as a fair share of the profits, and sometimes a darned sight more than his fair share. He wants all he can get out of the surplus. Both sides have had their eyes on the division of the surplus as the most important element. But the moment scientific management is introduced, the great change which comes under it is this, that both sides realize that if they will stop pulling apart, if they will stop thinking about the division of the surplus and stop fighting and pulling in opposite directions, and both push hard, shoulder to shoulder, as friends, cooperating morning, noon, and night in the most friendly, brotherly manner, it is possible to make this surplus so large that there is no occasion for quarreling over its division, absolutely no room for quarreling over the division. By this cooperation, by this change from the attitude of antagonism to the attitude of friendliness, it is possible to make that surplus so much that there is no chance of difference. That is a total change in outlook from look-

ing at the division, to looking to the enlargement of the surplus as the great thing. That is one of the great mental changes that takes place on both sides. I want to emphasize that.

Now I will try to get on and tell you what scientific management is.

The CHAIRMAN. Go ahead.

Mr. TAYLOR. I am very slow in getting at these matters. Now I come to the essence of scientific management. I think I can make it clearer to you what the essence of scientific management is by first turning to what I believe you will all recognize to be the best of the older types of industry, the best of the older types of management. I want to leave out all the subordinate types. I want to make it so that I think every one of you will say, "Yes; that is the best of the older types of management."

If you have an establishment, say, with five hundred or a thousand men in it, you will have 10 or 15 different parts at least. Now, the men in those parts have learned all that they know through tradition.

It has been handed down to them from man to man. There has hardly been a book written on industry that is worth reading, to speak of. I served two apprenticeships in my day, and all of my reading was confined to Joshua Rose's book on machine-shop practice. I think I read it through in two hours and a half. That was the only one available to the machinists in that trade, almost. Now hundreds of them are put out, but still I do not find the machinists or the apprentices reading very much. I have a boy who thinks he is going to be a doctor. I insisted that he should leave college at the end of his freshman year and work as a machinist, because I think that no matter what a young man is going to be he has got to get down to hard work early in life if he is going to amount to anything, or if he wants to have the best chance to get down to anything. So I insisted that the boy should get up at 5 o'clock in the morning, cook his own breakfast, and work as a workman at a good hard task under scientific management. He had no chance to loaf; he was not over-driven; I never was afraid of that in the least, nor was he, but he realized that he was up against a good hard day's work all of that year. I made him a present of a lot of books when he went into the industry, thinking that I would let him learn something about the theory of machine-shop practice. I bought him the nicest books I could get for him. He never opened them. At least, I never found any evidence of that. I never bothered the poor boy. I thought that getting up at 5 o'clock in the morning and getting his work out was enough. I never bothered him. I do not believe he read any one of them, and as far as I know, none of them ever were read.

What I want to emphasize is that our trades are learned just as they were in the Middle Ages. That is true of workmen, and I have no doubt the same term is used now as was used when I was a boy—you pick up a trade. You do not learn it. We always used to say, "I am picking up a trade," and you do it; you literally pick up your trade. You look at this fellow and that fellow to see what they are doing. It lies with yourself; it does not lie with some one else to teach you a trade any more than it did 50 years ago. I am not belittling this knowledge that comes from a trade. It is the greatest asset that a workman has—a trade. But the manufacturer, the boss, the superintendent who knows anything about the business, who has lived with his workmen, who understands the problem, must realize that his first object ought to be to get the true initiative of his workmen, to get their hard work and good will. A boss who does not realize that amounts to nothing, and if he realizes that, then he will have to say to himself, "If I am going to get the real friendship of my men, if I am going to get them to stop soldering and to increase their output, I have got to pay them more or do something more for them than my competitors are doing for their workmen"; and if a man is large minded, if he is a big man, he deliberately sets out to do something better for his workmen than other people are doing for theirs—paying better wages and giving them shorter hours.

A man who deliberately sets out to do something better for his workmen than other people are doing for theirs, will get the benefit of it, and the workmen will grow less and less suspicious. They are justly and properly suspicious of any new scheme, or any old trick that comes along, for they have been tricked and tricked and tricked. They are properly suspicious of any new trick that comes along, and they think that it is a new trick, possibly a speeding up game to cut down their wages, but if a man will keep at that policy, in every case the workmen will respond and give him his money's worth. Why? Because they are just the same as all the rest of mankind. They are generous if you will treat

them generously, and they are mean if you will treat them meanly. They will do just what other people will do all over the world. I want to make a comparison between scientific management and the old type of management, because in each the employer deliberately sets out to give his workmen better things than other people are giving to their workmen, and in each the workman will respond by giving more work, more ingenuity, and everything else. I think you will recognize that as the best of the older types of industry.

I am going to try to show you beyond peradventure that there is no possibility of even this fine type of management competing with the practice of scientific management; there is no possibility of it. The practices of scientific management are so much more powerful that there is no possibility of even the finest kind of management competing with it.

The first of the great reasons is that under scientific management the men give their initiative, their good will, their hard work with absolute regularity. That, however, is the lesser of the two gains that comes under scientific management. The great gain that comes under scientific management consists of the new and absolutely unheard of duties and burdens which are voluntarily assumed by the men on the management side, new things that the management never dreamed of, new duties and obligations in the performance of the work that the management has to take over.

It is these great duties voluntarily assumed by the men on the management side that makes the vast improvement, that makes scientific management always better, inevitably better than even the best of the older types of management. These new duties have been divided into four large groups, and these groups of duties have been readily arranged under the present scientific management, and it is to the efficacy and the power of these different principles that I wish to direct your attention, and in which I wish you to become interested. It will not take very long from now on. I want to interest you in the four principles and to show you their great power.

The first of the great duties that are undertaken in scientific management that never were undertaken before, is that those on the management side deliberately start to gather in this great mass of intuitive knowledge, of rule of thumb knowledge, that has been in the minds, in the heads of workmen, and to tabulate it, to record it and to reduce it to laws and rules, and in many cases to mathematically formulate them so that when these laws, these new rules that never existed in the past, are used by cooperation in the management of men, it will prove itself of inestimable value. Mark you, this is done by the management, and the workmen are able to turn out without any more exertion an enormous increase of output, and this is simply through the gathering in of this great mass of rule of thumb knowledge and systematizing it and reducing it to a science. In other words, it is the development of a science out of this old rule of thumb knowledge, and it is from that element that scientific management has its name—the development of a new set of laws, where no laws existed, in place of the old rule of thumb knowledge that was in the head and the body of the workmen. That is the first great duty voluntarily taken over by those on the management side.

The second is the scientific selection, and then the progressive development of every workman in the establishment. It becomes the duty of those on the management side to study every single man in that establishment to see what his possibilities are, to see his limitations, and after having studied that man, to deliberately set up and raise him to a higher level in the first place—to a higher level of capacity and to a higher level of training and education, and then to higher wages than he had before. It is the study of every man and the making of every man. In the past we all know that with all well-managed companies they studied their machines. But under scientific management it becomes far more important to study, not a few men, but all men. Every man has to become a matter of personal solicitude, with the determination that you are going to raise that man higher in the scale than he has ever been before; that you are going to give him higher wages than he ever had before; that you are going to treat him as a friend. That is the second great duty.

The third is, and I wish you to mark it, the bringing of the science and this trained man together, for they will not come together voluntarily. You may train your man and develop your science, but unless there is some power to bring those two together the workman will go ahead as before, because none of us want to change in our ways and do something new, unless there is something to bring us together.

That word "bring" has a disagreeable sound. The greatest incentive to bring these together is this, that you show the man that if he does the new way in the first place he will get from 33 to 100 per cent higher wages. That is a powerful influence to "bring." Every time he carries out the new set of laws, he increases his output and his wages from 33 to 100 per cent. There is no uncertainty as to whether he does or does not carry them out. He has automatically increased his wage from 30 to 100 per cent. That is a powerful "bring." But, in addition to that, there is something more. There is the spirit of friendliness and cooperation; the spirit of, if you do your share I will do my share, which is the greatest element of all scientific management and cooperation and that produces the bringing. The word "bring" has a powerful sound, but it is necessary to "bring." Mankind is so fixed that unless somebody does the bringing they will not come. We are all fixed that way. Go and look into any enterprise and you will find that there has got to be a limit, there has got to be a go, there has got to be something fixed or you will not rise to it; but I can soften the word "bring" by saying that nine-tenths of our trouble comes from the management side, and only one-tenth comes from the workmen. To make the new men do their work our trouble is mostly with the management and none of it, practically, is with the workmen. We never have any trouble with the workmen, but we have infinite trouble in teaching the management to do their new duties.

They start with the mental attitude, "Oh, yes; I would like this new thing; it is a new scheme for making men do more work"; but when it is pointed out that the greater part of this thing rests with them; that they have to do new things; that makes a difference. Oh no, they say, and our trouble comes in making them to do what they ought to do—that is, their share of cooperation.

The force of the principles of scientific management lies in an almost equal division of the work on both sides, between the workmen and the management. The work which was all done in the past by the workmen is divided into two great parts, and one of those parts is deliberately taken over by the management, so that there is actual cooperation in the bringing out of the work. For instance, in an elaborate machine shop doing miscellaneous work—I am not talking about repeat shops—in a shop where they do miscellaneous work, there will be one man on the management side and a number of machinists. That slice of work is deliberately taken out of the hands of the machinists and handed over to the management. When you have this great actual division of the work, when you have every act performed by every workman in the shop preceded by an act of some one on the part of the management, when no man can do his work right unless some man on the part of the management has performed his first, where there is an interchange of work all day long, you can not have war. You are cooperating for the same thing, so that with the object of having the workman earn more wages and the management larger profits, the only hope of that is to outstrip your competitors, and in order to do that both parties have to work interchangeably with an absolute cooperation, with an absolute interchange of work. You can not fight with the man who is working right alongside of you, who is working for the same object. When you and he are working for the same object, you work together for that end or you quit. You can not go on working side by side for the same thing and be enemies. You must be friends. So, Mr. Chairman and gentlemen of the commission, that is the great reason of all why under this equal division, perhaps more than any other feature, there has never been a strike under scientific management. What is there to strike against, when you are all cooperating for the same end? There are no two objects.

I want to repeat these four great principles of scientific management, briefly: First, the development of science to replace the old rule of thumb knowledge; second, the scientific study of every workman and the progressive development of that workman in training and educating him, and bringing him to a better class of work, at a better rate of wage; third, the bringing of the science and the trained workman together; and, fourth, this almost equal division of the whole work of the establishment between both sides. That is, the actual work is divided into two tasks, and one of them is taken by the workman and the other by the management.

I am going to try to convince you of the power of these four principles, with several illustrations, and I hope during these illustrations you will see only these principles, and not that you will see something else that is interesting. I hope that you will see that the improvement brought about has been due to these principles, and not due to something else. I want to show you the

power of these principles. That is the reason I am going to give you the illustrations. Ordinarily, illustrations of this kind begin with pig-iron handling, and most people think that is the beginning and end of scientific management, whereas, pig-iron handling has become almost a lost art. The moment I came to the Bethlehem Steel Works and saw men handling pig in the old-fashioned way, we started to get up machinery, and before I left there it was all handled by machinery. I have taken the illustration of handling pig iron simply because it is the most rudimentary form of labor known to mankind. Think of anything else that is as rudimentary. In the first place a pig uniformly runs about 92 pounds, and varies only a few pounds one way or the other. In the second place, the man who handles that pig handles it without any implements but his hands. Is there anything more rudimentary in labor than picking up a piece of uniform weight with your hands, carrying it off a few feet and dropping it? But I am not going to give that illustration, because it takes almost half an hour. If I had the time I could show you beyond peradventure that the science of handling pig iron is so great that the man who is fit to handle pig iron can not possibly understand the science. That is true of almost all industry. The higher up in any industry, the more true it is that the man who is fit to do the science can not possibly understand it.

I am going to show you a little later that the man who is fit to do machine-shop work can not possibly understand the science of it, it is so great. That is true of pig-iron handling, and that is the reason I take that illustration, to show the effect and power of the science. I can not take the pig iron handling illustration this morning, but I will take the next thing which is close to it, and that is shoveling. I dare say that you people will think that there is not much science in shoveling, but I want to show you that there is, and how powerful that is, and its effect on the workman. If any of you gentlemen or ladies had the development of the science of shoveling to work out, you would probably sit down right now and use your imagination. You would not have to go outside and watch men shoveling. Within two days you would have mapped out enough work for yourself to last three or four months, and that in developing the science of shoveling. There is so much to it. When I first came to the Bethlehem Steel Works I went to the old office there, and looked out of the window. Nearby there was a lot of cars loaded with rice coal, and there were four or five men shoveling that rice coal. After these men had unloaded the rice coal they walked to another part of the yard where there was a pile of ore from Mesaba, and with the same shovel they shoveled that ore. In shoveling the rice coal they took a load of three and three-quarters pounds on their shovel. When they were shoveling the ore they took a load of 38 pounds. It does not take very much science, or very much of anything, except the plainest horse sense, to see that if three and three-quarters pounds is the right load for that shovel, 38 pounds is the wrong load. That is common sense.

There is no science about that. Science comes in when you deliberately set out to know what is the right shovel load. I want to show you gentlemen this new change in the mental attitude. The old way of finding out the proper shovel load is to sit down and write to half a dozen contractors and say, What is the proper load for my men to take on a shovel? You get an opinion from those men, and you write it down, and then you say that is the law. That is the usual way. However, there is another way that is even more common yet. You say to yourself, "Why, I have a good foreman, Pat, who has been shoveling for me here for a long time. He is the best of shovelers for the last 10 years and I will call him in and ask him about the proposition." So you call in Pat and you say, "Pat, what load ought your men to have on a shovel?" I will tell you that my Irish friends are resourceful, and they are never at a loss for an answer. Pat will tell you right off, about 12½ pounds. He is not going to be stumped with a question like that whether he knows about it or not. Then that becomes the law, and that is the way the law is gotten under the old management—12½ pounds. That is quite the uniform way of getting at it. I want now to show you the new. You never write to anyone, you say that is up to us and that we have to know what the proper load is. What we did long before we struck the Bethlehem Steel Works is this: We sent for two good shovelers, big, powerful fellows; well suited for their work. Mark my words, we never take a human instrument that is badly suited for its work any more than we would take a bad machine. We take a proper human animal, just as we would take a proper horse to study. If you wanted to study the hauling of coal, you would not take a pony and study him, but

you would take a dray horse, and in the same way you would take a man who is suited to shoveling. Now, we say to Mike and Jim, "I want you to do a whole lot of fool things. This is no joke. We are going to pay you double wages while this is going on, and all we ask of you is to do what that young fellow is going to ask you to do, what is perfectly right. He is going to say, I want you fellows to work so that when you go home at night you will go home properly tired, not tired out, but properly tired, for you men know how a man ought to be at the end of a proper day's work—not exhausted, but so that you could go right straight through this thing for years."

Let me say, Mr. Chairman, that under no condition or circumstance is it the policy of anyone connected with scientific management to overwork or hurry anyone. The word "hurry" is unknown in scientific management. You never can do decent work when anyone is hurrying. On the other hand you insist that you shall have the right implements, that the right men shall be chosen for their work, that ultimately in the selection of men you will get the right man doing the right work, and you will insist that the man who is shoveling shall go home properly and reasonably tired, but not exhausted. We told these men what they were to do, and we said, "This is no joke, and if this young fellow catches you soldiering, you go out and never come in again. You need not do it unless you want to do it. We are simply asking you to do a proper day's work, but if you soldier or try to shirk, if you take it for a joke, this young fellow will be onto you, and you will go out and never come back again. Those men undertook to do that, and they were absolutely square, and I have always found my workmen friends as straight and fair as other men. What we did then was to start them up against a big shovel load first. We started with a large shovel load, and we took the number of shovels they used during the day. Many hundred other records were taken. These two fellows were put in different parts of the work, with different watchers. At the end of the day, after weighing the shovel loads, we found that they took 38-pound shovel loads. We then found that they did a certain amount of tonnage during the day. We then cut the shovel off so that they would handle a load of 34 pounds, and immediately the tonnage work for the day went up. We again cut the shovel load off to 30 pounds and again the tonnage went up. Then it was cut off to 26 pounds and it again went up, and at 21 pounds, or at 21½ pounds, they did their biggest day's work. When we cut it off below that, the tonnage for the day went down. There is the scientific fact that a shoveler properly suited to his work will do his biggest day's work with a shovel load of 21 pounds. Let us see how far-reaching that fact was. That is one of the many elements of shoveling. There are many parts of it, and that is one of them.

Let us see how far-reaching that was. The workers in the yard of the Bethlehem Steel Works all owned their own shovels. We had to take those shovels away from them, and build a big shovel tool room, and buy 8 or 10 or 12 different kinds of shoveling implements, and equip this large tool room with an immense range of shoveling implements, so that for each kind of work the men would have the proper kind of shoveling implements. If he were to shovel rice coal, he would have an immense scoop which would take about 21 pounds. When he was to shovel Mesaba ore he would have a different kind of shovel. They went further than that. There were from 400 to 600 shovelers in that yard. In order to do our duty toward them, they had to study every man, every shoveler. Prior to that time they were handled in big gangs, by one or two foremen. We had to begin to study every single workman in the 400 to 600. We had to give them in advance specific directions about their work. We had to work out a plan for them. We built a labor office. It meant the laying out of this yard, two and one-half miles long and half a mile wide, in a big diagram, and arranging a specific job or place for each man, sending this shoveler to this place, and the other shoveler to the other place. It involved supplying each man with a new kind of shovel, with one kind to shovel ore, another kind for sand, still another for coke or coal or whatever it was each man was to shovel. It required one kind of a shovel for soft coal, another kind of a shovel for hard coal—an entirely new shoveling implement. It meant that in order to do justice to each of these men we had to inform them the next morning, when they came on to work, whether they had properly made good the day before or not, because we insisted that no one should work with us who could not earn 60 per cent higher wages than were paid in that part of the country.

The first thing I did when I came there was to learn that the ruling wage was \$1 a day, or, I believe, \$1.05, an inconceivably low wage. I horrified the Bethlehem Steel Co. by saying "We are going to pay \$1.15 right off to our labor." They thought that was wild. I said "Not at all. We are going to pay \$1.15. We are not going to pay the lowest wage, but we are going to pay the highest price in this part of the country." I said that every man on this work must earn 60 per cent more than \$1.15 before we were through with them. I said we would have the men trained so they could earn 60 per cent higher wages than they were then earning. It is not just to a man to keep him working three days and then tell him "You have not made good." Every morning, when these fellows come in, they reach their hand into a little pocket—most of them could not read and write, but they could find their way to their pocket—and pick out two pieces of paper. One of those directed them to the tool room, told them what implement to get, and the part of the yard in which they were to work, or start their first day's work. The second slip of paper was either a yellow slip or a white slip. If it was a yellow slip, they knew they had fallen down yesterday, that they had not earned 60 per cent higher wages than the average. They knew they had not earned 60 per cent higher wages, and that something was wrong. They had a chance to look back over yesterday's work and see what was wrong, to say "What did I do that was wrong?" If they could read and write, they would see where they had fallen down. Most of them could read and write. Those who could not read and write were supplied with that information.

When a man got three or four yellow slips, this would happen: I want to point out this in the mental attitude of the men under their new duties under scientific management. When a man had three or four yellow slips under this method, under this new system, instead of feeling anxious and stirred up and unhappy, and saying "Oh, hell, something is going to happen," as they used to under the old system, they said, "I have gone wrong somewhere." Under the old system every man knew what would happen if he had three or four yellow slips. The foreman—and I am not complaining of the foreman, because it is what I would have done if I had been that foreman—would have said "Here, Pat, you have four or five yellow slips; you are no good; get out of here. You are not a high-priced man; get out of here." That is the old way.

The new way I want to point out. When it was learned that so-and-so had three or four yellow slips, one of the teachers was then told "So-and-so has fallen down for four days; go down and see what is the matter." If possible, the man who originally taught him was sent to him; the man who originally taught him to shovel was sent down. Along would come his teacher—not the old fellow with glasses on, or with a college degree, but a star performer with a shovel. Not only that, but a man who had sense enough not only to shovel right myself, but to show other people how to shovel right. That man would go down to him and say "Mike, you have three or four yellow slips. What is the matter? Have you been drunk? Are you sick? If you are sick, or anything is the matter with you, we will give you a chance somewhere else while you are getting better." "No; I am all right." "If you are not sick and have not been drunk, and if there is nothing wrong with you, you have forgotten how to shovel. I taught you how to shovel. Come on, I want to show you how to shovel." He would simply stand there and watch him.

There are many, many ways in which to get along with a shovel; many, many ways in which a man can get along shoveling. You may smile at such a thing as that, but shoveling is quite an art. There is a good deal of knack in knowing how to shovel right, in the throwing of your shovel to keep your load together, as you have seen if you have watched a real good shoveler. You will see that he will load his shovel in one way and throw it in one way, whereas he would have to be another kind of a shoveler if he were shoveling fuel into a boiler. If you are shoveling coal into a boiler—and I presume some of you gentlemen have done it; I have done it—you have to handle your shovel in a certain way. But in shoveling any other substance, it is a totally different thing. In shoveling coal into a boiler you must have a little shovel and know how to spread over the grate. With hard-coal firing it is absolutely necessary to do that. The art of shoveling is a great one, and there are many parts to it. I am only throwing out one or two of them.

Every one knows, that knows anything about shoveling, that if you are going to shovel right you must shovel, if possible, from an iron bottom, and if not

from an iron bottom, then from a wooden bottom, and if you do not have a wooden bottom, then a hard dirt bottom. There is less trouble then than when you have to go right into the top of the pile. When you go into the top of the pile a great part of the exertion is put forth and a great part of the energy is lost in getting your shovel into the pile. That is the difficulty—getting it in. When you study the art of shoveling it is a different matter. Every workman is taught to take a shovel into his right hand and push into the pile—to first get the right shaped shovel, and that comes from the tool room. He must have a sharp-end shovel. Hold your right arm down on your hip, and when you shove into it, push forward with your body like that [indicating], and throw the weight of your body on it. There is no arm exertion in that. That is the whole question, simply throwing the weight of your body forward. Time and again we would find these workmen who had been told how to do this, and then found their yellow slips, had forgotten that and had gone back to shoveling with their arms. That is impossible; the exertion is much greater. It takes two or three times as much exertion to shovel in that way. That one little correction would sometimes bring a man back.

It is things of that sort that affect their mental attitude. If that man fell down, it was probably from the fact that he was not taught right. We have not been with him long enough in the first place. But that man would stay right alongside of him, perhaps a day, watching him all day long, and whenever he slipped up in any of the elements of shoveling—and there are a good many of them—when he showed he had forgotten how to have that little jerk at the end when he wanted to keep the load together, he would show him how it was done, how to do it, until he learned just how to do it.

I am not talking to you people about shoveling because you are particularly interested in shoveling, but I want you to see what I mean by this development of the art of shoveling first, and then our duty toward the men. It is our duty to train and develop and raise every man up to a higher level. It is our business to be honest to that man and to teach him, not to “nigger drive” him, not to go for him and call him names and “holler” at him. That is no part of scientific management whatever.

The question must come into your minds, Does all this thing pay? Does it pay to teach your workmen all this? Can you make your dollars and cents meet with all this? If we have to build a new labor office, if we have to build a new shovel tool room, if we have to put in a telephone system, if we have to put in a messenger system, if we have to have clerks work all night, does it pay? Yes; I say it does. We are individualizing every man. It is our duty to measure each single man's work and help each man if we can. This corps of study men and clerks and teachers means money. If it does not pay, there is nothing in scientific management. Mark my words. It is not entirely a philanthropic scheme. It must pay both sides; it must pay the workingman and it must pay the employers and pay them well, or there is nothing in scientific management; at the end of three and one-half years we were able to know whether it paid. In the last six months practically every man in that yard was on task work, whereas when we came there there was no man worked that way. They fortunately had records there of what it costs. They handled several million tons a year in that yard. It costs between 7 and 8 cents a ton, and that is low. In railroad work the average price is between 9 and 10 cents. A figure between 7 and 8 cents is a low figure. When you add all this overhead cost and all this teaching and the salaries of all these officers, when you pay your men 60 per cent higher wages—and every one of them was paid 60 per cent higher wages than they could get around that country anywhere—the cost of handling a ton was reduced from between 7 and 8 cents to between 3 and 4 cents, and the actual saving to that works in dollars and cents during the last six months was an average of between \$75,000 and \$80,000 per year. There is your justification, the workmen earning 80 per cent higher wages on the one hand. We had every man examined very carefully. There were 140 working then. When we started there were between 400 and 600. A great many people say, “Yes; they were driven out of the works to jump in the river and drown themselves.” If you will ask me later I will tell you what became of them, what became of that difference between the 400 to 600 and the 140. This is generally the thing prominent in people's minds, so I am anticipating just a little. If you are interested enough, I will tell you later what became of those men.

When those fellows were happy, contented, receiving higher wages than they have ever supposed, not a man overworked, only 2 of them said to be

drinking men out of the 140—I mean to say, heavy drinkers—that justifies both sides—increased profits on the one side and increased pay on the other side. That justifies the corporation and the men.

I want to give just one more illustration. I want to jump into a higher field, and that is machine-shop work, and I want to say to you again what I started to say, that the science of doing work is always so great that it is impossible for the workman who is fit to work under it to understand that science. I will try to make good in that statement. It is impossible for the workman to understand, the science is so great.

My friend, Mr. Barth, went to a large company who wanted to change over from the old system—the old-fashioned way of work to the new. They had piecework in that plant, and wanted to change to the new way. This company employs between 3,000 and 4,000 men; I think more than that now. The department in which Mr. Barth was going to do his work was manufacturing a little machine about that square and that big [indicating]. That is repeated work, repeated over and over again. It is a patented machine. There were 300 or 400 men in the department that had been making that same machine for some 12 years. Naturally they had become very skilled in their work.

Mr. Barth, I think, horrified the owner of the business by telling him in advance that he would be able to get twice as much work out of that department as they had been doing. Naturally, the gentleman became rather perturbed about that, and, after some little sparring, Mr. Barth suggested that a test should be made of the machine to see whether this could be done. A very fair machine was selected by the gentleman, and then a record was kept of how long it took to do work on that machine. It was written down by all of the parties. It was agreed to. Then, Mr. Barth put in, not the same articles, but articles which were typical, and showed the workmen how to do that work, and made his test. I want to show you what he did first.

These employers made this test for the purpose of investigating the machine. It is our business, when we go into a shop, to study not only the men, but also to study the machine, and study them in a manner in which they have never been studied before. We are not doing our duty to the workmen unless we get them the very finest implements—unless we study these machines and know all about them. The only way you can study a machine in the machine shop is by means of these slide rules. This rule [indicating] will solve any belting problem, however intricate, and will solve it in a few seconds. Some of the machines are run by belt and motor in a machine shop. This will solve any belt problem in a few seconds. The other one [indicating] will solve a gear trouble in a few seconds, and they are quite difficult, some of them, more or less difficult of solution. But this slide will solve any gear trouble in less than no time. This one [indicating] will tell you the exact pressure which a given shift will have on the tool you are cutting with. It will give the depth of the cut and the feed—whatever the nature of the metal you are working with. This will tell him how many thousands of pressure will act on that tool. The fourth one will tell you the proper cutting speed at which to run that tool so as to have your tool edge wear out at the end of half an hour, an hour, or whatever time you desire. By the use of this method it was possible for Mr. Barth to write a prescription for the respeeding of those machines.

Gentlemen, I want to state a fact which is realized by very few people—machines are not only badly speeded, but they are outrageously speeded. They are speeded so badly it is inconceivable. They are 200 to 300 per cent above what they should be. You may think that is a very broad assertion and a very great piece of exaggeration.

I was asked to speak before the Tool Builders' Association, the people who make these machines, in their convention at Atlantic City. They were all there—the owners of our large machine shops and their engineers. I said to them what I am saying to you. I said: Now, gentlemen, in your own shops, your own machines are speeded 200, 300, or 400 per cent wrong, and you know it if you know anything. They were speeded years ago by some one's guess. They have never been speeded by science. Some of your modern machines are right; but the great bulk of them are all speeded wrong." I threw down that challenge to them. Not one of them took up the challenge. I said: "If any of you would like to take up this challenge, I will show you that your machines are speeded wrong." I do not want you to understand that I am exaggerating, because that is a fact. Mr. Barth found that the machine which he examined was speeded all wrong, and he wrote a prescription for it—just

how it ought to be speeded. What I am trying to do is to show you how it is that a man equipped in the art of cutting metals is able not only to more than compete, but is able to do two, three, or four times the work that it is possible for the finest mechanic in the world to do who does not know that science. There was a machinist who had been working for years on this same basis, on the same lathe, but what could that poor fellow do when his lathe was speeded wrong? His lathe was speeded 200 or 300 per cent wrong. What chance had he? He had no chance at all.

But I will show you how much chance he had—even if it had been speeded right. I will show you that pretty soon. At the end of a week Mr. Barth came back with a slide rule like this one which I have here. He went home and made an instrument like that, which is used for running all the machines in our machine shop. Every machine in the shop has an instrument like that to run it with. This instrument embodies the laws of cutting metals. By the use of this instrument Mr. Barth was able to show that same man how to do his work so that his smallest gain was two and one-half times as much, and, I think, his largest gain was about nine times as much. By this instrument he was able to accomplish that much. It is not Mr. Barth's skill. The results of years and years of experimenting are embodied in this. I want to show you why that is. I want to make it clear why this science amounts to so much, and what it is.

I came to the Midvale Steel Works as a laborer and then got to be a clerk, and then I was in the tool room, and then finally got to be gang boss of the machines and then foreman in the shop. When I got to be gang boss of the machines I knew the whole game. The owners of that business thought they were running the business. The owners of that shop thought they were running that shop. It was a piecework shop. It had been running a night gang and a day gang. The owners thought they were running it. We knew they were not. We had the work carefully laid out so we were doing about a third of a day's work. Every young man who came in there was told, "Here, don't do more than two or three pieces before noon. We will tell you the game at noon." When I became a gang boss they all came to me and said, "Fred, you are not going to be a piecework hog, are you?" I said, "I am going to get more work from these lathes. I have been straight with you fellows, and now I am on the other side of the fence, I am going to get more work out of the machines." They said, "Then take it from us, we will have you over that fence inside of three weeks. That means war. We will wipe you out." I said, "All right; very good."

That started a fight, and a despicable fight. Any man who has undertaken to drive a lot of men to do something against their interest—to force them to do things they do not want to do—is up against a mighty mean proposition, let me tell you, and no man, I do not care who he is, can welcome such a thing as that if he has any sort of decency or any sort of feeling about it. There is nothing in life that is much meaner to do. I had three years of the hardest, meanest, most contemptible work of any man's life to do in trying to drive my friends to do a decent day's work. They believed it was not for their interest to do it. They were determined not to do it. I had the backing of the company in a remarkable manner, or I could not have gotten anywhere. But I had the thorough backing of the company, so at the end of three years I succeeded in winning out, and have doubled the output of the shop; but I can tell you I was not proud of it. No man can be proud of such a performance as that. He can only feel the disgustingness of it. At the end of that time I was determined to quit that business and go into something else, or find some remedy for that state of things. It is a horrible state of things where every man is against you and you are against every man. If any man has ever been through it he knows how mean and contemptible it is.

When I got to be foreman of the shop and had finally won out and we had an agreement among the men that there would be so much work done—not a full day's work, but a pretty good day's work—we all came to an understanding and had no further fighting. Then I tried to analyze it, and I said, "What has been the matter with all this thing?" I said, "The main trouble with this thing is that you have been quarreling because there have been no proper standards for a day's work. You do not know what a proper day's work is. Those fellows know 10 times more than you do, but, personally, we do not know anything about what a day's work is. We make a bluff at it and the other side makes a guess at it and then we fight. The great thing is that we do not know what is a proper day's work." I went to Mr. William Sellers, the president of the com-

pany, and said: "I want to spend some money—a good deal of money—in trying to educate the foremen of our shop and the superintendents of our steel works in what a man ought to do for a day's work—what is fair, just, and right for a man to do." He said that thing had been tried a good many times, but there was nothing in it; that I could not work it out. Finally he gave in and allowed us to spend money, chiefly because we had been successful in his fight. He appreciated that it had been a stiff fight, and out of personal regard he allowed us to start.

The first thing we wanted to do was to settle the question which every mechanic and machinist had supposed was the essence of the whole matter, and that was, what was the proper angle for tools, what was the proper clearance angle, what was the proper side slope, and what was the proper back slope. Our machinists all thought if we could get the right cutting angles, those three angles, they could do a great deal faster work than they ever did before. So we started to find out, and it was an extraordinary thing that we were the only shop in Philadelphia that could have found that out. We happened to have a great big pile of uniform metal to work on. We had 2,000 tons of locomotive tires—plenty of them in the scrap heap. That was metal of a uniform type. So we had plenty of splendid metal to work on, and we had the only machine in Philadelphia on which we could make those experiments. So we started men to work right along and varied the cutting angles, and kept a record of what we did. For six months those experiments went on, and at the end of that time we had arrived at the extraordinary fact that it did not make much, if any, difference what those cutting angles were as far as speed went. We got only negative results. I told Mr. Sellers that and he laughed at me, and said, "That shows the whole thing. There is a lot of money blown into the fire." I said, "That is all right, Mr. Sellers, but let me show you that we have uncovered a gold mine of information. We have got to the top of a gold mine, and I want to show you what it is." When I was able to show Mr. Sellers the information we had already got, and that we were on the track of getting, which would enable our men to do faster and better work, he said, "Go right ahead and spend the money. I don't care." They started then to spend money on these experiments, which went on throughout practically the whole time I was at the Midvale Steel Works. Men were all cutting up chips to try to find the art of cutting metals. Then, when I left there our methods of financing these experiments were at an end. We could not go on there. Then, the only way we could carry on the experiments was to swap the information we had with anyone who was able to furnish the materials and the men to conduct these investigations. By the means which I have stated, we have developed the art of cutting metal. For nearly 26 years, almost without cessation, men were engaged in developing the science or art of cutting metals. That seems preposterous and ridiculous, to think of that length of time, but when you see the magnitude of the problem, even those of you who are not experimenters will realize the difficulty and almost the impossibility of successfully conducting an experiment in which there are 12 variable elements. In the art of cutting metals there are 12 variable elements, 11 of which have to be kept constant while the twelfth is varied; and the difficulty in holding them constant is next to impossible.

What do I mean by that? You must get uniform metal. You must have about 20,000 pounds of metal in order to make a single experiment. That metal must be absolutely uniform in quality throughout its 20,000 pounds. To get a mass of metal weighing 20,000 pounds that is uniform is next to impossible. The way we solved it was by using the same method that is used in gun forgings, by using the finest steel that could be had, hydraulic forging, or forging under a heavy hammer, oil tempering it, annealing it, getting out test bars until we had refined the grain until it had been so refined that it was uniform all the way through. Then we were able to eliminate one of the great difficulties, and one of the variables became practically constant. We had 20,000 pounds of uniform metal. It would very often take six months to make the forgings in advance, ready to continue these experiments. I point that out merely to show how it was that anyone could take 26 years in carrying on a series of experiments. During those 26 years, to show you the magnitude of the work, we spent about \$200,000 in wages and material. About 800,000 pounds of metal were cut up into small chips while we were studying the conditions and laws. The number of recorded experiments alone, those that were written down, amounted to some 50,000, and the unrecorded experiments amounted to many more.

You may think I am showing this to show that Mr. Barth and Mr. Gantt and a lot of our friends are remarkable men. Nothing of the kind. I am saying this to give you gentlemen a bird's-eye view of what is going to take place in every industry and in every element of every industry, something similar to this that is going to take place as sure as fate. The information that in the past has been in the heads of workmen is coming out of the heads of workmen, to be reduced to law, to be reduced to science, and then, through the cooperation of both sides, is going to enable the workmen and the company when they join hands to turn out an enormously increased output. And from that increased output is coming vast good both to the workmen and to the whole world. That is what I am pointing out.

Let me call your attention to one other element. During 18 years, or a part of 18 years, we had mathematicians employed in solving the mathematical problems that came up. Every one of these laws had to be reduced to a mathematical formula. Then we found ourselves with 12 mathematical formulæ to use in solving an ordinary machinery-shop problem. I dare say some of you gentlemen do not know what a machine-shop problem is. It is a thing which every workman has to settle when he puts a piece of work into a lathe, to know what speed to use, and what feed to use. The workman has to settle those things every time he puts something into his lathe. He has to settle every time, "What feed shall I use and what speed shall I use." And in answering those two questions you need this great mass of mathematical laws, 12 great mathematical formulæ.

Think of it. After we develop these 12 formulæ, a man with the facility of the average mathematician could solve the problem by hand, writing it all out, in from 4 to 6 hours. Think of the absurdity of taking 4 to 6 hours to solve a mathematical problem to tell a workman how to run a cut that does not last over 15 minutes. The average cut does not last over that length of time. To tell a mathematician to spend 4 to 6 hours to tell a workman how to run a cut that takes 15 minutes seems preposterous and a farce. For a long time it looked that way. Now, there are hundreds of these mathematical sciences being developed, and anyone who has had any experience in developing anything of this sort will realize that what at first seems an absolute blank wall of impossibility becomes entirely possible and easy before you are through. That 18 years of mathematical work is an illustration of the amount of labor which was involved in this problem, until finally it has resulted in this work which Mr. Barth has done. I think we will all agree that Mr. Barth is far and away the best mathematician who was ever on this work. I do not want to detract at all from Mr. Gantt, who is much better than I was or could be: but I think Mr. Gantt will also give the palm to Mr. Barth. However, the problem was very nearly solved—you may say the great bulk of the problem was well on toward solution—when Mr. Barth took it. Seven different mathematicians have worked on this problem one after another, Mr. Gantt and Mr. Barth having done the finest work of the seven, beyond any doubt.

Through their work this slide rule was made, which in the hands of the ordinary workman, who knows nothing about mathematics, enables him to solve that problem with 12 unknown quantities in it in about 20 seconds. This is the first case in mathematics in which it has ever been possible to solve a problem with 12 unknown quantities and do it with any degree of rapidity. In proof of that I will say that as this thing went on I went time and again and applied to mathematicians in different parts of this country for a solution. Whenever I heard of a mathematician in a university I said, "I will pay you any price if you will give us a quicker solution for this problem." Most of them sneered at me and said: "My dear boy, you can solve a problem if you have an equation with three unknown quantities. You can solve it if you have four unknown quantities, rarely five, and never six; and this is an indeterminate problem, and you can not solve it by any known means except trial and error." That was the answer we got from all the great mathematicians. What I want to emphasize is that here are very ordinary men, Mr. Barth excepted. The rest of us are very ordinary mathematicians, and yet by simple digging and hard work and keeping at it, giving time to it and putting money into it, we were able to solve what the world recognizes as a very difficult mathematical problem. What I want to emphasize is that no one should ever be discouraged in the development and application of science on account of the difficulties which he meets at the start. You should never admit the impossibility of doing a thing simply because it looks to be impossible.

Now, gentlemen, a slide rule of this type is made for every machine in the machine shop, and it represents a new code of laws, just as important as the laws of the United States. It is the first time that laws have come into industry to supersede opinions. This slide rule represents the laws of cutting metals. No one's opinion amounts to anything when it is backed up against this code of laws. This code of laws is just as much above every man on the management side as it is above every workman. No man on the management side can any more go against that code of laws than any workman can go against it and violate it. It is the essence of scientific management.

There is another code of laws. There is a machine-shop time study, the most of which was done by my friend, Mr. Merrick, whom I see here. Mr. Merrick is responsible, more than any other man on earth for 10 or 12 years of development of the code of laws governing the actions of workmen in a machine shop. This code of laws is completely over and completely controls the actions of every man on the management side just as much as it is over the actions and controls the actions of every man on the workmen's side. And I want to call your attention to this fact, that for the first time in the machine-shop industry some one's opinions count for nothing. The opinions of workmen count for nothing; the opinions of foremen count for nothing. These laws control both sides. You may say, and it has often been said to me, "Yes; but all of these laws have been developed by the management. The workmen have had no part in it." It is an extraordinary fact that knows of no set of laws except these in which the workmen have had one-half of the share. The workmen have done all the work in developing that, in running the machines, and curiously enough they have had one-half of the work of developing it, and the other man is a man trained from a workman, a trained observer to study the laws, to write them down, to record them, and to make them useful. It is a curious thing, but I know of no science that has ever been developed in which the workmen have had so large a part as in this science.

Let me now call your attention to this fact, which is the most important fact connected with it, that the interests of both sides in these laws are absolutely identical. There can not be the slightest opposition of interest in this thing. Under the principles of scientific management our only hope of continually paying from 33 to 100 per cent higher wages than the other people are paying is that we shall get a reasonable maximum output from every man in the place. That reasonable maximum of output must be something which shall never hurt anyone, even after 50 years of employment; which shall never overwork anyone; never hurry anyone. Unless we get that reasonable maximum it is impossible to pay from 33 to 100 per cent higher wages than your competitors pay. So the object of both sides is exactly the same. There is no conflict of object in it. It is just as important for the management to get these laws right as it is for the men. There is no such thing as tyrannizing; no such thing as asking too much, because these laws have to be tried out daily with the workmen of the establishment. They prove themselves false or they prove themselves right every day. Many of these laws were worked out and developed in the Link Belt Co., of Philadelphia. This particular code of laws is tried out every day by the workmen of the Link Belt Co. They work under these laws and that slide rule every day, all day long; and the proof that they are right is this: That 98 per cent of the men make good in their tasks every day. If these laws were wrong, 98 per cent of the men could not make good under them. They must be just as far as the workmen is concerned. They can not be wrong to the workmen, because 98 per cent of the men make good under these laws, and it is our duty to investigate and find out why the other 2 per cent fail to make good.

Now, one of three things could happen, and it has happened every time. Either we find that something is wrong about this code of laws—that is one alternative—or second, some man on the managing side has had the code of laws wrong; has made an error.

Third, it may be that we have not properly trained the workman, that he is not up to his work, or has slipped up for some reason. We find that the mistakes are about even between the management and the men. The management makes mistakes and the men make mistakes, and I want to emphasize this, that when a mistake is made, all that it is necessary to do is for any workman to say, "This is a mistake. This code of laws is wrong. I have failed to do my proper task." It is not a question of nigger driving, and saying, "I know these things. You have got to do these things." Why, no. You say,

"Something is wrong. An investigation has got to be made, there is no doubt about it. Let it be made." There is no doubt about what the orders are. There is no doubt about whether these laws have been or have not been justly applied. Every workman gets a time-table like that [indicating] every day, and every time he does a thing, he has this table, to tell him how many minutes he has got to do this, that, and the other thing in, under the code of laws, so that whenever a thing goes wrong, the workman says, "Here, you ask me to do this piece of work in 12 minutes. I can not do it in 12 minutes."

Then an investigation has to be made. Either our slide rule is wrong, or the workman is wrong. An investigation is made of which the workman is a part. He is part of that investigation. It is not made outside. That workman is every time satisfied either that it is wrong or that it is right, and if it is wrong, that code of laws is altered. Of course it was wrong. Of course at the start any number of these observations were wrong, and they soon thrashed those out in actual practice, because they have a meeting of both sides, because both sides want to have them right. It is not for the interest of one side to have them right and the other side to have them wrong. Their interests are absolutely identical in that matter. There is no effort ever made to hurry a man, no effort ever made to nigger-drive anyone; it is by common consent; that is what we are after. A proper day's work, a perfectly reasonable day's work is what we want, and these laws are entirely open and aboveboard. No foreman can do what he ought not to do with those laws without it being found out. He has got to find out.

The record shows that the code of laws is right in most cases, but the men are just as anxious to have it spread and increased, and to have the correct result reached, as the management is. I remember when the Link Belt Co. reported 45 per cent of their men who were able to be given a task, they said, "We will never get beyond that. That is our limit." That is a tremendously miscellaneous company. They said, "We will never get beyond 45 per cent." I said, "Oh, wait a few years." When they got up to 75 per cent they said the same thing. We are now at 80 per cent of the men on the high bonus under those time-tables. Why is it?

Let me tell you, gentlemen, that the difficulty is on the management's side. It is not with the workmen. We never have any trouble with the workmen.

The great difficulty is in training the men on the management side, getting our men trained so we can use these laws, getting them to understand how to develop these laws. That takes time and patience on the part of the men; that takes time and patience on the part of the management. It takes time and patience all the way round. It takes a firm belief in the fact that justice is being done or aimed to be done to people. While these men are being trained, of course things go wrong. These men are all fallible. But all the men came up from workmen. There is hardly a man on the management side that was not at one time a workingman. They are human, and they are apt to make mistakes. When it becomes for the interest of all to have these laws right and have them applied right, you will have a new condition in industry.

Gentlemen, I want to emphasize of all things the immense new power that has come into industry through a code of laws that never existed before. That code of laws is above both management and men, just as much above the one as the other, just as much as the law of the United States is above both the officers of the Government and the people; just as much the one as the other. Under scientific management they are all subjects of the law instead of subjects of the union. For instance, let us have an illustration of what I mean by that:

There used to be a rule in industry, very largely, that men started to work at sunrise. Under the old régime, before there was any almanac, it might be a matter of opinion, we will say. Suppose we are going to start a company to-morrow morning. It might be a matter of opinion on the part of the foreman and the owner of the business, on the one hand, and of the workmen on the other hand, as to when the sun would rise. The foreman and the owner might say, "The sun rises at 5.30." But the workmen, on the other hand, would exclaim, "Oh, no; no such thing; the sun does not rise until 6.30." Under the old régime that would be a subject for collective bargaining. They could get together and bargain and thrash the thing out and say, "We will agree the sun does rise at 6 o'clock, and we will start to-morrow morning at 6 o'clock." The moment you have an almanac there is no collective bargaining. It is a fact when the sun will rise.

But those subjects which are subjects for collective bargaining—and I advocate it, and I strongly advocate it—I believe in unions; they are doing fine

work—but where these things which formerly were the main subjects of collective bargaining have ceased to be subjects for collective bargaining we have the facts before us. They are true or false, and if they are false they must be found out by experts, by men fit to do it wherever the case may arise, no matter what part of the world or where the case is from—the expert who is best able to discover and present these facts. You would not think of collective bargaining in the matter of whether there was an eclipse of the moon. You would in that case go to an astronomer. Many of these things are not subjects of collective bargaining; they are facts. They are true or they are false, and it is to the interest of both sides to get at the truth. Can anything in this world live in falsehood, anything worth while in this world? It is inconceivable. It can not ever be for the interests of any set of men to live in falsehood.

I would like to show you, if you will allow me, a solution of a problem by this slide rule. I want to show how utterly impossible it was for the poor fellow to carry all these things in his mind. I will solve a problem for you, if you will allow me.

There is a book [indicating] which contains the annual addresses of the president of the Society of Mechanical Engineers. Some years ago I was surprised, just as much as would be any of you gentlemen here, to be told I was nominated to be president of the Society of Mechanical Engineers, and for about three months, while the nomination was on, before the election, my chest got larger and larger, and I had to have somebody back of me to hold up my head to keep me from falling over backward. Four days after the election I was given a dinner. My head and chest suddenly contracted when I was told I had been elected because the society needed reorganizing, and it was believed I was the man to do it. I had a big year's duty ahead of me.

One duty as president of the Society of Mechanical Engineers is to write an address at the end of the term, and, not being able to write an ordinary address, I decided to write up this series of experiments in the art of cutting metal. There is one series of experiments. On that little line [indicating] it would take perhaps a week's work to get those figures. Any one who has had anything to do with experimenting knows that the moment you get a piece of experimental knowledge you must lock it up in the safe, put it away from yourself, and never touch it again until you get to the end, because as you find yourself approaching a law it is next to impossible not to be biased in your judgment. At the end of six or eight months that information is taken out of the safe and spread out on a table, like that [indicating].

The next step is to take this set of figures, average them, and put them in the shape of little crosses on that diagram. Every one of that group of figures comes from a series of crosses. They are connected with little, fine lines, and then comes the work of the mathematician. He has to hunt up a formula which will put the heavy, black lines right through the other little crosses. That is the way mathematics has worked this out. That is the way this formula represents this law, embodied in this way.

After that is developed, that law is put onto this slide rule in the shape of these figures there, with relation to these and those [indicating], and the exact relative position of that set of figures with this and that [indicating] represents the same thing as that [indicating]. You have five ways of expressing a law. There [indicating] it is blind. There it is in the shape of a cross, next in the shape of a heavy black line, and next it is in that formula, and next it is there in that way [indicating]. These state exactly the same thing. There are five ways of stating exactly the same thing. We had 12 of these formulas, representing the art of cutting metal. I will show you how they should work. The first thing the workman has to decide is, How long do I want my tool to run without regrinding. He is told by a certain section of this rule that for a tool 1 by 2 inches it ought to be ground every hour in order to get maximum economy. It took a year and a half of experimenting to develop that fact. It is shown for each size of tool the most economical period it will run without regrinding. That is the first thing to settle. Next, what depth of cut shall I take? He might take from one-sixteenth of an inch up to 1 inch. We will say he takes a quarter of an inch. He slides the quarter inch down opposite here [indicating]. Next comes, of great bearing, the kind of metal that is being cut. Chilled iron you can only run about 9 inches in a minute; mild steel you can run 350 feet in a given length of time. This [indicating] tells the kind of metal you are cutting. We will say it is class 13.

Next we have the power that must be employed. That work might be anywhere from nothing up to 5 feet in diameter. We will say it is 10 inches.

We will slide this [indicating] to opposite class 13. You can cut there with 1 tool, 2, 3, or 4 tools on the machine. We will say that a man is running two tools, or two men are running a machine with one man to each tool. We will use two tools of a quarter of an inch. For the pressure on the tool we slide this 10-inch diameter opposite class 13, and now we are ready to solve that problem. These are the needs of the workmen. These are the things the workman must know. The workman must know that "A" means to use his triple gear; he knows that "D" means to throw his drive belt to a certain place; and he knows that "S" means something else. Here is "3-A-F." Carry that with your eyes across in this way [indicating]; that is about three-quarters of an inch. There is "4-A-F"; carry it across; that is about three-sixteenths. Carry "5-A-F" across; that is about five-sixteenths. Because this one happens to be to the left of that [indicating]—and the workman does not need to know why—that is the proper speed indicated there.

Let me show you what that poor fellow had to carry in his mind who was up against this proposition. If you want your tools to be reground at the end of an hour, if you want a certain depth of cut, if you know the quality of your metal is class 13 you know the diameter of your work is 10, but it might be anywhere from that up to 16. You have to carry all this formula in your head. If you have two cutting tools, if the pressure on your tool corresponds to class 13 and you place the resistance accordingly, you will do your best work by throwing your driving wheel on the floor and your triple here [indicating], and following out the other items as I have explained them to you, as shown by this rule.

Under the old plan the workman had to carry all these things in his head; and besides that he had to respect his machine, and he had no hope of doing that accurately.

I want to thank you very much, Mr. Chairman.

The CHAIRMAN. You have covered the general subject. Undoubtedly the members of the commission have some questions to ask. Mr. Garretson, have you some questions to ask Mr. Taylor?

Commissioner GARRETSON. No; I do not know that I have.

The CHAIRMAN. Have you any questions, Mr. Weinstock?

Commissioner WEINSTOCK. Yes. Just a question or two, Mr. Taylor, if you do not mind answering them.

Mr. TAYLOR. Certainly.

Commissioner WEINSTOCK. Under this system of scientific management does the worker have a voice in determining the price or the premium he is to receive?

Mr. TAYLOR. The worker had no voice in that. I will go back, however, and show you the kind of voice he had. It may sound strange—it does sound strange to a man who has the old viewpoint—to be told that that is again a question which properly is one for scientific investigation. That is what we prefer primarily, that that is a question for scientific investigation. You want to do what is fair to yourself. I will show you how that is being applied primarily.

I had lots of friends in the Midvale Steel Works, friends just as intimate among the workmen as my brothers are, or as any friends could be. I went to a group of five or six of those fellows and said, "I would like you to go on such and such a kind of work and work for a premium of, we will say, 15 per cent added to your wages." I went to other groups at other kinds of work and offered 20 and 25 and 30 and 35 per cent. I said to these men, "Just work ahead at this and see whether you like it better than you did before. See whether this suits you." I said to them, "Mind you, you are now subject to limitations you were not subject to before. Some one now comes and tells you just how fast you are to do things and how you have to do them." That is disagreeable. No one likes that. It is not pleasant. Here is a set of laws, a new code of laws. I said to them, "When we tell you we want you to use such and such feed and such and such speed we want you to use it. You will have to act under certain limitations that you did not have before. We want you to do that, and then at the end of six or eight or nine months, after you have tried the thing, if you like it we will go ahead, and if you do not like it you may go back; we are perfectly willing to have you go back to the old conditions."

I should say one-third of the 15 per cent men stuck to it and the others wanted to go back. When it came to the 20 per cent men a larger number of them stuck and the others went back. Of the 25 per cent men more stuck

that went back, but still more liked the old better than the new method—of those just coming under it, but not after they worked under it for any length of time.

When we got to the 30 per cent men all but one stuck, and at 35 per cent every man stuck and was satisfied with the new thing. There is an indication of a law, and you want to do justice. Mind you, the men were new and had come freshly at this new thing and they disliked it. No one likes new things; no one likes to change their ways right off if they have formed a life habit of doing things a certain way. The fact that when we got up as high as the 30 and 35 per cent men all of them stuck, was an indication that at least we were doing justice to those men; showing we satisfied some of them. We found them all very well satisfied with it, in fact. There has never been a question on the part of our friends whether this premium is just or fair. When it comes to a certain kind of work, you have to pay 100 per cent in order to be just and fair. That is not a question for collective bargaining. It is a scientific investigation. Let me make it clear to you: We welcome in every possible way the cooperation of every man in our establishment. We welcome the cooperation of the unions and will pay them for their cooperation; we welcome it and want it. We want their help. They could do immense things toward this.

The day is not far distant when they are going to ask for this being done, and that the machines in their shops be properly studied and properly speeded, so they can get higher wages, for you can not pay the high wages if you do not get the increased output, and you can not get the increased output if you go along in the same sloppy way, and do not study your machines and do not make a science of every machine in the place, and if you do not study all your men and show them the best methods and give them the benefit of the experience of 100 shops instead of the experience of the old-fashioned foreman or the training of one man. You are not doing justice to your men. The time is coming as sure as the sun shines when the unions will take that up and insist on the employers doing their proper share of the work, that they shall make this proper study of their machines and do these other things. We welcome the help of the unions. What we do not welcome is when they try to put us out of business. I do not feel the slightest resentment against the union leaders because they have seen fit to roast scientific management, because in their ignorance of it they have written things about it that are totally untrue.

They say it is a nigger-driving proposition, a proposition to speed up. The thing I do feel sorry for is that these men who write these things will not come to our works and see for themselves. If they came they would not write that kind of thing any more.

The CHAIRMAN. May I make a suggestion for the purpose of speed? I was asked this morning to allow you to present your views in your own way; that is, to present your proposition in your own way. Of course, that was done. We would like, if possible, for you to leave off the argumentative part of the matter in your answers to these questions.

Mr. TAYLOR. Certainly.

Commissioner O'CONNELL. Of course, we want you to put your own system into effect here.

Mr. TAYLOR. Very well; I will accept that suggestion.

Commissioner WEINSTOCK. Would it or would it not, in your judgment, be wise and expedient to give labor a voice in determining the premiums and prices.

Mr. TAYLOR. I think that the moment that labor asks for it they will have it. They have never asked for it before because they have looked upon what they were getting as just and fair. The matter has never come up before me as a question; the fairness of it has never come up. They have accepted things as they are, and they have never said that they were anything but fair. In fact, they are more than fair.

Commissioner WEINSTOCK. Then you would have no objection to giving labor a voice?

Mr. TAYLOR. Not the slightest objection. I would welcome it.

Commissioner WEINSTOCK. Just one more question, and I am through. You pointed out that the system of permitting things to be determined by mere opinions will soon be a dead system; that the system of the future will be based upon the facts.

Mr. TAYLOR. Yes.

Commissioner WEINSTOCK. Now, assuming that to be true, what will be the ultimate, when all production has adopted scientific methods; what will be the result?

Mr. TAYLOR. Going right back to fundamentals, now, if you do not bring wealth into the world you can not distribute it. The first thing, then, is to bring the wealth into the world, and then you can make your distribution. The first thing for the interest of the workingmen—and they get nine-tenths of it all—is to bring in twice as much, to produce twice as much by our factories and our shops, to every year turn out twice the amount of production, and that is going to be distributed among the workers, and they will get it. That is the first thing. In order to accomplish that, men must coordinate. The workmen and the manufacturers must get together, and the managers must say, "We will show you how; we will choose the men, the most trained men, to show the other men." That is the first thing. Cooperation must take place between the two sides. In order that that shall take place the workmen must cooperate. It is irksome to the workman; there is a certain amount that is disagreeable about this cooperation. If you allow every man to do just as he darned pleases in one case and in another case give them certain rules which they must follow it is somewhat irksome to them, and workmen will not prefer that to the old method unless they are paid higher wages for it, much higher wages than they were getting before. There it is; this is what the world wants. This is the important fact in industry; about 17 per cent of the world is engaged in coordinated industry. The rest is engaged in some other form of labor, farm labor or town distribution, and so on; and this 17 per cent which is engaged in coordinated industry will insist that they rise that much higher above the dead level, and they will not be satisfied without it. The same ratio must exist between the dead level of the world's industry, that is the 83 per cent of the world, which fixed the wages of the world—the relative value of things—and these men who are cooperating in an unusual way, who are sacrificing themselves, if you choose to put it that way, who go into this great game of cooperation. It is just like a baseball team. You never will find a baseball team where one man is not called upon now and then to sacrifice. It is darned mean for a fellow to have to sacrifice when he might make a run, but he must do it for the benefit of the whole community.

The same thing exists in the industrial community. We have all got to cooperate. There have got to be certain things that are disagreeable about industry, and the men are going to insist, the men who are doing this thing for the benefit of the whole community will insist that they should get a proper pay above the rest. The problem is perfectly clear to me.

The CHAIRMAN. Do you deem that an answer? Is there anything else? Mr. Lennon, have you any questions?

Commissioner LENNON. No; I prefer to give Mr. O'Connell, so far as I am concerned, a chance to ask questions.

The CHAIRMAN. Mrs. Harriman, have you any questions?

Commissioner HARRIMAN. Mr. Taylor, I should like to know what guarantee the workmen have under the present system that an unscrupulous employer will not speed them up—I mean under the system that you describe.

Mr. TAYLOR. Because, Mrs. Harriman, speeding up results in less work and not in more work. You can not hurry without that result. I defy you to go into any of our shops and look and find a man that is overworking, in our establishments. If you find any man in any of our establishments who is overworking I will give \$50 to any charity you say. Those who have seen our establishments say that the remarkable feature about them is the fact that there is no hurry in them.

Commissioner HARRIMAN. But they are all good employers in your establishments. I am speaking of the condition of ordinary workmen under unscrupulous employers.

Mr. TAYLOR. If any of you have ever seen our people, you will understand that it is a friendly game. The moment a man is speeded up he refers to these laws, and there it is. You can not speed him up while these laws exist. And as to those laws, mind you, now, you take the Watertown Arsenal. Of course, these laws are still being added to, but at the Watertown Arsenal there is very little chance for an unscrupulous employer to do anything of that kind, because they have these laws there. Of course, there are mistakes made. They are fallible and they do make mistakes; but when they make a mistake it is instantly found out.

You put something under a time table and you give it to a man and he says he can not do that. He says, "Come and show me," and you have got to go and show him. He says, "I will take this thing, and you take the stop watch and time me." The man can not do it, and if he can not, that settles it. When a man takes a task and the workman says he can not do it, and he says to the workman, "You take the stop watch and I will do this," and he does it, then he says to the workman, "I will take the stop watch now, and I will see what is the matter with you." Generally speaking, he finds that the workman is making some false motions, he has not got the right way of handling himself. That is the way this code of laws is thrashed out.

Commissioner HARRIMAN. Then, you think that the system itself is a guaranty against—

Commissioner WEINSTOCK. Overwork?

Commissioner HARRIMAN. Yes; against overwork and overspeeding?

Mr. TAYLOR. It is not as it was developed originally, but that code of laws which has been thrashed out, in which 80 per cent of the men every day have been making good, that has been proved. Every man on the management side is just as much under that code of laws as the workmen.

Commissioner HARRIMAN. Are there pacemakers in these establishments?

Mr. TAYLOR. We have no such thing as a pacemaker. When a man goes out to do that work he is an efficient man. We never choose an inefficient man.

Commissioner HARRIMAN. He is not an exceptional man?

Mr. TAYLOR. No; he is not an exceptional man.

Commissioner HARRIMAN. No; that is it.

Mr. TAYLOR. We insist that every one of our men shall be a first-class man—shall become a first-class man.

The CHAIRMAN. Mrs. Harriman says that is a sufficient answer. Thank you. Prof. Commons, have you any questions to ask?

Commissioner COMMONS. No.

The CHAIRMAN. Mr. Delano, have you any questions?

Commissioner DELANO. I think that I have understood what you have said, except one thing that you said in answer to Mr. Weinstock. You spoke of 17 per cent being coordinated workers.

Mr. TAYLOR. Seventeen per cent of the world's workers are coordinated workers.

Commissioner DELANO. I wanted to see if I understood—

Mr. TAYLOR. That is, engaged in manufacturing establishments and similar establishments where men work together, as against the gardener and the grocery man and the coachman and those engaged in distribution, etc.

Gentlemen, mind you, in all that I say, in all the generalizations that I have made, about workmen, and in talking about soldiering, I have in mind only coordinated industry. My gardener is a much harder working man than I ever was in the world, and he has no incentive except kindness and honesty and decency. I never coached him in any way, and my working friends would not do it if it was not for their interests. It is no stigma on a man to soldier.

Commissioner BALLARD. You spoke of dividing men up into groups. One should work at 5, another at 10, and another at 15, and another group at 30 per cent, and so on. Was any selection made of those men?

Mr. TAYLOR. No; we took them as they came. They were friends of mine engaged in the shop, and some of them in other shops—not all machine shops.

Commissioner BALLARD. There was no selection of the men?

Mr. TAYLOR. No. What we were after was the truth.

Commissioner BALLARD. I understand.

Mr. TAYLOR. We were not after somebody—

Commissioner BALLARD. I appreciate that. Now, has any careful study been made of the men themselves to find out whether they were really tired, those who performed these larger tasks?

Mr. TAYLOR. Let me tell you one thing. A great part of these things were made in a machine shop. We will say fourteen-fifteenths of the work was in a machine shop. Now, you can not overwork men in a machine shop; it is impossible to overwork them in a machine shop, because the periods of rest are so great. You can not overwork them.

The CHAIRMAN. The question is, was any study made of that thing, in that manner or otherwise, to find out if the men really were tired?

Mr. TAYLOR. Yes. Many of them were in the machine shop, and those men can not be overworked. Now, on vise work, heavy vise work, you can overwork them.

The CHAIRMAN. He was asking you about the ascertainment of that fact alone. Was there any effort made to ascertain if they were overworked?

Mr. TAYLOR. Yes; but they were not. They were not forced to do anything.

The CHAIRMAN. Answering the question exactly as it was asked, an effort was made to ascertain?

Mr. TAYLOR. Yes, indeed. And remember, too——

The CHAIRMAN. That is the answer. There will be time perhaps for a little argument afterwards, but let us get through with the questions.

Mr. O'Connell, have you any questions?

Commissioner O'CONNELL. I want to ask you several questions, and if you will be as brief as possible in your answers I will be obliged. We will put your system into operation right here.

The law creating this commission provides that it shall seek to ascertain the underlying cause of industrial unrest. Do you consider the question of efficiency, as you have it in mind, one of the essential things for industrial peace?

Mr. TAYLOR. Indeed, I do. I think that without any question it is. For instance, in the case of the Link Belt Co., the average man has been in the employ of that company for eight years, as shown by this report before the House committee. And in a similar company, run by the friends of Mr. Dodge, a very notable company, one of the finest in this country, one of the partners came to me and said, with tears in his eyes, "The saddest thing that has happened in our industry in the last eight years is that we have lost 45 per cent of our men, changing every year."

Commissioner O'CONNELL. We have a great many efficiency systems—the Taylor system and the Emerson system and the Van Alstyne system and the Brumbacher system, and a great number of others. Relatively what is the difference between all of these systems? Can you not all agree upon some system?

Mr. TAYLOR. I am not bothering about other people's systems. I am only bothering about scientific management, and I can not criticize Mr. Brumbacher's system or anybody else's system. I have only tried to set forth ours, and, really, I can not criticize anybody else's system. I do not think I ought to do that.

Commissioner O'CONNELL. In what number of shops in the United States is the so-called Taylor system in operation?

Mr. TAYLOR. I can not tell you that. I know that I hear of new plants all the time, where they have been working at it for 6 or 8 or 10 years. I have been astonished to hear from them, I know—places that I never heard of and never knew that they were working at it. I know perhaps of 100 different plants in which it is working, but I really do not know how many there are in all.

Commissioner O'CONNELL. Have you any idea of the number of people who are employed under the Taylor system?

Mr. TAYLOR. If I should answer that, it would be only the veriest kind of a guess. I should think by this time there must be 150,000 or 200,000; but I do not know. I do not think anyone knows how many there are.

Commissioner O'CONNELL. You have been engaged in work on the system for 30 or 25 years?

Mr. TAYLOR. The first steps were taken toward forming it in 1881 or 1882.

Commissioner O'CONNELL. At the Bethlehem Steel Works I notice throughout your discussion you speak of the men never being overworked and all that. I find in your book here, on page 54, you say something about that.

Mr. TAYLOR. Which one of the books are you quoting from—Shop Management?

Commissioner O'CONNELL. Yes; Shop Management. I quote your language: "When the writer left the steel works the Bethlehem pieceworkers were the finest body of picked men that has ever been seen together."

Mr. TAYLOR. No; "that he has ever seen together."

Commissioner O'CONNELL. Of course, I am quoting you.

Mr. TAYLOR. Not "that has ever been seen together," but the language is "that he has ever seen together."

Commissioner O'CONNELL. That is what I said.

Mr. TAYLOR. Not "that has ever been seen together."

Commissioner O'CONNELL. Well, do not let us haggle over that word. I continue reading:

"They were practically all first-class men, because in each case the task which they were called upon to perform was such that only a first-class man could do it. The tasks were all purposely made so severe that not more than

one out of five laborers (perhaps even a smaller percentage than this) could keep up."

Mr. TAYLOR. Yes.

Commissioner O'CONNELL. Was that not an extreme task, at which only one out of five laborers could keep up? Was it possible for them to perform the task?

Mr. TAYLOR. No, indeed; this refers to pig-iron handling, don't you see? There are very few men suited to pig-iron handling. To give you an illustration that I know will appeal to you: Most men have not studied men. All men have studied horses. Now, what we say is that a first-class man shall be chosen for his job every time. If you in Washington here were going to haul your coal, you would sooner or later insist that you should have it hauled by good, big dray horses. You might take in an emergency, when you did not have the big horses, a grocery-wagon horse or some other small horse, but sooner or later you would say, "I am going to have good, big dray horses."

Commissioner O'CONNELL. We will quit raising small horses after a while, then?

Mr. TAYLOR. Not at all. We would have grocery-wagon horses to haul grocery wagons, and donkeys for hauling carts, and polo ponies for their work; but you would say that no donkey would haul coal for you in the future; that only Percheron horses shall haul coal. We were forced to say in the first place that we had not enough Percheron horses. The way those men came on that work, they selected themselves. They came right out on the street and said; "We would like to handle pig iron." There was no selection made at the time. There was a gang of a hundred men running along with a foreman, whether they were fit for it or not. We said, "In order that we may be able to pay these men proper wages we have got to get the Percheron horses to handling pig iron," and in order to do that we had to select them. There is no injustice in that.

Commissioner O'CONNELL. You say that the output and production of your plants, where your system has been in operation, has increased 100 per cent or more?

Mr. TAYLOR. Yes.

Commissioner O'CONNELL. Have the hours of labor been reduced in any of those plants, where the system has been in operation, to eight hours a day, where the output has been increased?

Mr. TAYLOR. Oh, yes; wherever it has been possible to do it. If you have read what I wrote about the Simms Ruling Machine Co., you will remember the conditions that I found there—that I found girls that were working 10 hours a day. Without waiting for any system or anything else, I just knew that it was inhuman to work girls 10 hours a day.

The CHAIRMAN. Instead of arguing these specific cases, will you kindly answer Mr. O'Connell's questions and tell him what institutions you now have in mind where the hours were reduced to eight per day on account of this system being adopted?

Mr. TAYLOR. The Simms Ruling Machine Co.

The CHAIRMAN. Any others?

Mr. TAYLOR. To eight hours per day?

The CHAIRMAN. Yes.

Mr. TAYLOR. Mr. Fife, who has just reduced in the clothing industry to eight hours a day.

The CHAIRMAN. Are there any others that you recall?

Mr. TAYLOR. I can recall lots of them that have gone down from 10 hours to 9 hours.

The CHAIRMAN. But no more that have gone to eight hours, that you think of now?

Mr. TAYLOR. I will look them up and write you about it.

The CHAIRMAN. Very well. That is enough.

Commissioner O'CONNELL. Has the Link Belt Co. reduced its hours?

Mr. TAYLOR. Surely; to 54 hours a week.

Commissioner O'CONNELL. How long has 54 hours been in operation there?

Mr. TAYLOR. Eight or ten years, I should say.

Commissioner O'CONNELL. How long have they had this system there?

Mr. TAYLOR. Just a little longer than that.

Commissioner O'CONNELL. Were they not working 54 hours a week when that system was put in?

Mr. TAYLOR. I do not think so. I am pretty sure of that. I am not positive of it. I am sure that the Taylor Co. has reduced hours. We always try to do that. But we will never reduce hours if we are going to make the men work harder.

Commissioner O'CONNELL. You say in your experience there never has been a strike occur where the efficiency system has been put in?

Mr. TAYLOR. I never said that; most emphatically not. I said where scientific management has been adopted there has never been a strike. There are thousands of efficiency systems.

Commissioner O'CONNELL. Has the Bethlehem Steel Co. reduced its hours of labor since that system has been put in?

Mr. TAYLOR. I have not been there myself for 12 years, but the last time I knew of it there were two distinct systems in use at the Bethlehem Steel Co.—our system in the fine work and the old-fashioned individual driving system in the rest of the works.

The CHAIRMAN. Then your answer is that you do not know whether scientific management is now in the plant referred to by Mr. O'Connell?

Mr. TAYLOR. I was trying to explain—

Commissioner O'CONNELL. The machine shop, you mean? That is, the department in which they have the finer work?

Mr. TAYLOR. Yes.

Commissioner O'CONNELL. Isn't it true that about two years ago there was a general strike in there which caused a general turmoil?

Mr. TAYLOR. I never heard of it in the machine shop. The machine shop ran until they had nothing to work on, if I am informed right, and then they quit.

Commissioner O'CONNELL. The machine shop was where it was inaugurated.

Mr. TAYLOR. I beg your pardon.

Commissioner O'CONNELL. Have you ever heard of a strike there?

Mr. TAYLOR. Yes; but those men were not working under our system. Do you mean to say men that dropped down out of the sky? No; of course the men were not working under our system.

The CHAIRMAN. That is the answer. There is no use repeating it.

Commissioner O'CONNELL. Well, if the efficiency system was introduced in the foundry in the Watertown Arsenal, and the men went on strike—

Mr. TAYLOR. It was not introduced, because it takes two or three years to introduce our system anywhere. You can not introduce it in an hour. You can not develop this code of laws and introduce it in a day.

Commissioner O'CONNELL. I understand this occurred three years after the system had been started.

Mr. TAYLOR. The molders had not had a solitary thing. They had no tables and no time system, and nothing had been done. They struck at the drop of the hat.

Commissioner O'CONNELL. I recall reading in one of your books—just now I can not lay my hand on it—that it was necessary to inculcate in the minds of all those concerned that they must bear in mind constantly that this company is organized for the purpose of paying dividends to its stockholders. Do I quote you correctly?

Mr. TAYLOR. I think I can read you from this pamphlet what you are trying to quote.

The CHAIRMAN. Let me make a suggestion, that if any member of the commission is going to refer to any writing of the witness, the writing itself should be read to him, because it leaves so much room, if you do not do that, between the understanding and recollection of the interrogator and that of the witness that there would be no end of it.

Mr. TAYLOR. I have this right here.

The CHAIRMAN. One minute, Mr. Taylor. You say you have there the passage referred to?

Mr. TAYLOR. Yes. It is as follows:

"All employees should bear in mind that each shop exists, first, last, and all the time, for the purpose of paying dividends to its owners."

The CHAIRMAN. I understand you have some explanation that you wish to make?

Mr. TAYLOR. Yes.

The CHAIRMAN. Make it as clear and as short as you can.

Mr. TAYLOR. No greater piece of injustice—

Commissioner O'CONNELL. Are you quoting?

Mr. TAYLOR. No. I say no greater injustice can be done to an author than to take an isolated passage from one of his works and quote it. See the gross injustice of this. Here is a page that he points out, and this whole page is taken up in pointing out to the owners of a business that they ought to be decent to their men, that it is their duty to bring it to the highest state of efficiency in their shops. If they can not pay them higher wages, it is their duty to find work for them outside in other people's shops, and to hand over their good men, whom they have trained and paid their good money to train, to others. When I said that at the Midvale Steel Works Mr. Sillers (?) almost frothed at the mouth about that. I say it is their duty to promote their men and get higher pay for them. Then after pointing out that, I come around and say this to the workmen:

"On the other hand, this policy of promoting men and finding them new positions has its limits. No worse mistake can be made than that of allowing an establishment to be looked upon as a training school, to be used mainly for the education of many of its employees. All employees should bear in mind that each shop exists, first, last, and all the time, for the purpose of paying dividends to its owners."

Now, after you say that the employer ought to do certain things for his men, is it not perfectly proper to call the attention of the workmen to the fact that they ought to be decent to their employers, and that they must not look for promotion, and to the fact that those shops exist for the purposes stated here? Is it not injustice to me to take one of those things without the other and quote it, as has been done here?

Commissioner O'CONNELL. Do you believe in profit sharing between employer and employee?

Mr. TAYLOR. Certainly I do. We share profits every day. We give an increase of 30 per cent in wages.

Commissioner O'CONNELL. Do you believe that they should organize in their respective trades organizations?

Mr. TAYLOR. I believe in dealing with the older time type of employment; it is an absolute necessity. I have not as yet seen the necessity, under the newer system, and if there is any necessity, if it is for the benefit of the men, that is what I am looking for. If they can do better with it, they should have it.

Commissioner GARRETSON. In response to Mr. Ballard's question, Mr. Taylor, as to whether a study has been made or as to whether men were being overworked, you stated that it was an impossibility for a man to be overworked under your system.

Mr. TAYLOR. In the machine shops, I said. It is an absolute impossibility that they should be overworked. The periods of rest are too long. The period of time necessary for a man to rest from work in order not to be overworked is absolutely established. All you have to do is to put a weight on a man's arm and to calculate how much of his time in the day he is under that weight, and you can see whether he is overworked or not.

Commissioner GARRETSON. Whether he falls from exhaustion or not?

Mr. TAYLOR. No; but if men have been working with that load on their arms for generations and they are all right, then that is proof that they are not being overworked.

Commissioner GARRETSON. Not even if they die from it?

Mr. TAYLOR. But they do not die from it.

The CHAIRMAN. We will take our recess now until 2 o'clock.

(Whereupon, at 1 o'clock p. m., the commission took a recess until 2 o'clock p. m.)

AFTER RECESS—2 O'CLOCK P. M.

The CHAIRMAN. The commission will come to order. Commissioner Weinstock has a question or two further that he would like to ask you, Mr. Taylor.

TESTIMONY OF MR. FREDERICK W. TAYLOR—Continued.

Commissioner WEINSTOCK. It has been held, Mr. Taylor, by the opponents to your system and its critics, especially among those representing organized labor, that while it is admitted that, temporarily, the scientific system increases earnings, in the long run it cuts the earnings. Is that true?

Mr. TAYLOR. I can not conceive of any such fact. I can not conceive of the application of scientific knowledge failing to do anything but increase earnings, because it increases output, and invariably you will find one thing is true: You can not increase earnings without output. You may increase output

without increasing earnings, but the only road toward a permanent increase in wages is an increase in output permanently. That is true the world over.

Commissioner WEINSTOCK. And yet, according to your own statement of this question, Mr. Taylor, if I understood you correctly, you said that in the beginning this increased surplus either does go or has gone almost entirely to the employer; that later on the worker gets a part of it, but that, ultimately, the consumer gets it all.

Mr. TAYLOR. In this way: I was referring in that to the history before the introduction of our system. That is the history of the industry in the past. Look into the introduction of the factory system, and the employer got it all at first.

The CHAIRMAN. It does not apply to this system?

Mr. TAYLOR. Not at all. We absolutely safeguard our men.

Commissioner WEINSTOCK. Then, according to your idea, the present system means that this increased surplus is divided more or less equally among three factors—the employer, the worker, and the consumer?

Mr. TAYLOR. Yes; and, for the first time in industry, we have seen that, before anyone gets anything, the workmen have their 33 per cent to 200 per cent.

Commissioner WEINSTOCK. That is the first objective?

Mr. TAYLOR. That is the first thing we do.

Commissioner WEINSTOCK. Then you deny the charge that scientific management gives the worker only temporarily an increase in earnings?

Mr. TAYLOR. I point to every one of our companies, as far as I know, where it has been introduced. You will find those same percentages are paid still, so far as I know.

Commissioner WEINSTOCK. Has the system been in operation long enough to determine that as a permanent condition?

Mr. TAYLOR. In the company that I originally went to, where I first introduced it—the Midvale Steel Co.; I have not been there for something like 22 years; I have not been inside of that company; but I believe you will find the same thing still holds true. I can not conceive of any set of American workmen continuing to stay, as they have, year after year, with one company, unless they found that they were better treated there than anywhere else. I know that my workmen friends are still at the Midvale Steel Co.'s works, and I know, also, that the managers of the Midvale Steel Co.'s works are the same that I trained and left there many years ago. I can not conceive that things should have changed, although I know nothing about it. I have no personal knowledge of the matter.

Commissioner WEINSTOCK. It has also been contended that the scientific management system tends to a finer and finer subdivision of labor, and that the ultimate result, therefore, is to throw out the skilled worker and to replace him with the unskilled worker, thus preventing the development of mechanical ability.

Mr. TAYLOR. There is no question that, throughout all industry, there is a continual tendency toward the subdivision of work; but absolutely no greater under scientific management than under natural management. That is universal. You will find that in all trades everywhere. In any trade you will find this great subdivision going on.

Let me point out, however, this fact, which is not at all appreciated, that under scientific management we insist that every one of our workmen shall learn not one, but two or three or four trades. They have got to go up. Every man in our place goes up. We insist upon that.

It may be said that that is an assertion without proof, and I want to call your attention to the sworn statements before this House investigating committee. All of the men in an industry were there. There is a list of every man who started out, and what he was at this time. I refer to page 1502, third volume of the hearings before the House investigating committee, and that will show, as a result of this investigation there, that every man has gone up in wages and position, and that is so in every one of our companies. In our companies you will always find the same thing. We insist on our men going up. That is what we are there for—to keep them, to train them, and to let them see that we are their friends. Every man in the place knows that we propose to train him to do the finest and best class of work for which he is fitted sooner or later, and to bring him up.

Commissioner WEINSTOCK. You mean the purpose of the system is to bring out of the man the best there is in him, for his good and for the good of the employer?

Mr. TAYLOR. Yes; for their and our good. As we have said over and over again, our companies are mainly man factories, and secondarily something else. If we can first build up this high class set of men and train them and keep them to do good things, they will do the rest for us. There is no question about that.

Commissioner WEINSTOCK. Another point that has been made is this: That while it is admitted that the skilled worker under your system earns more than the skilled worker may have earned in the past, the fact remains that he becomes, after all, an unskilled worker when called out of his particular job?

Mr. TAYLOR. Our men are the most sought after of any people in the country. When a man leaves one of our establishments he can always get work, and they always come back to us when they get a chance.

Commissioner WEINSTOCK. They are all-round men?

Mr. TAYLOR. Certainly, because we have taught them, we have been kind to them—it is teaching, and not “nigger driving.” It is a scheme genuinely to help the man along. They could not be our friends otherwise, and they are our friends.

Commissioner WEINSTOCK. One more point: A statement has been made that nothing could be more unfair than to put a premium on muscle, rather than on brain; and that a man should be paid not only for what he does, but also for what he knows; that this system puts a premium on their muscle rather than on their brains; that a man who can turn out, grind out the most stuff, is the man who is more highly paid, regardless of his brain power.

Mr. TAYLOR. I am looking for a particular man's name—C. Cox. He came to this country January 1, 1900, as a laborer, at 15 cents. That fellow had not an opportunity to serve an apprenticeship. He was intelligent, but not a very well educated laborer. He was a very intelligent fellow, and exceedingly industrious, and a fine chap. He first became rather a good man as a helper, and then was given a drill press, and taught drill-press work, and lathe work, and planer work, and finally he became foreman and head of the whole department. He came at 15 cents an hour, and when this was written he was making 40 cents an hour as a machinist. We had taught that fellow five or six trades. That is what we propose to do for every man.

The complaint has been made that raising these fellows up supplants our high-class mechanics; but these high-class mechanics become our teachers. Our factories are all managed by the workmen. They graduate from workmen and come to the management, and then cooperate with their fellow workmen up in a higher position.

Every one of them do that. When we raise them to a position at which we can not afford to pay them any higher wages, we send them forth as superintendents and foremen of other works.

Commissioner WEINSTOCK. You pointed out very clearly and strongly that the first essential to succeed under this scientific management system is to have the good will and hearty cooperation of the workers. I think you also spoke of the fact that in the beginning they looked upon this whole thing with suspicion.

Mr. TAYLOR. Surely.

Commissioner WEINSTOCK. They looked upon it as meaning a cutting down of their earnings and losing their jobs. If that is their attitude in the beginning, how can you win them over and secure their good will and cooperation? How do you overcome this suspicious feeling?

Mr. TAYLOR. Slightly by talking to them, but not much. Talk does not accomplish very much. Principally by building up an object lesson. We say to a man, “Come on and cooperate with us.” One man comes on and cooperates with us, and we say to him, “It is a new thing and we will just try it and see if you do not like it.” And we teach that man, and give him the 30 per cent higher wages, and let him work out that thing right along. And the next thing that happens is that his friends, two or three of them, will come and say, “I would like to have some of this. Am I not just as good as he is?” And we say, “Certainly. Come along.” We never start in to change a factory over. We bring one man in and use him as an object lesson, and let him see what it is—whether it is an affair of “nigger driving” or whether there is anything bad about it. And these men see the other men getting these premiums, and they want them, too. They say, “He has got his; why can't I have mine?” The main complaint in our factories is not that we are introducing the system, but that, under this system, some of the fellows are not getting a show. They want to get in.

Commissioner WEINSTOCK. You mean that in the beginning they fight against it, and later they fight for it?

Mr. TAYLOR. In the beginning they fight against it, and in the end they fight for it; absolutely.

The CHAIRMAN. Mr. Thompson will you kindly ask your questions, or I think Mr. Garretson has some first.

Commissioner GARRETSON. You spoke this morning of a condition where the foreman went in and increased the rate of pay, and he was haled before the directory and discharged for disturbing the labor market, by directors who were able to dominate the situation. What guaranty is there in your scientific system against precisely that condition taking place in a plant where the scientific system has been carried to its ultimate fullness, when change of management might take place, or change of control?

Mr. TAYLOR. There is absolutely no guaranty possible against any kind of iniquity; you can not guarantee against that, but the man who did that would simply kill the goose that laid the golden egg; the moment he tries any such nonsense as that instantly his men would cease to be friends of his and the whole thing would tumble right down, and he would find his costs climbing right up, and the whole thing would tumble right away.

Commissioner GARRETSON. That is what you meant; exactly the same thing would take place that had taken place before the piecework system; a man would be measured by his output under the bonus system, and would be expected to do that much under the straight wage system?

Mr. TAYLOR. Let me tell you: A man is not going to do it; it falls right down instantly. This is a question of friendship and cooperation. The American workman is not a slave; you take away his premium and away goes half of his output.

Commissioner GARRETSON. He has gone back to the wage scale?

Mr. TAYLOR. And he has gone back to his original output; he is no worse than he was in the first place, and a darn fool comes in and thinks he can rob people. He can not.

Commissioner GARRETSON. Has not the "darn fool" been universal in the wage problem, as far as that wage problem goes?

Mr. TAYLOR. As applied to the companies which we have systematized, I have not in mind one single company that ever got this thing in that went back on it; not one. I have never heard of one.

Commissioner GARRETSON. Your system represents a fractional part of an inch in the measurement of centuries, does it not?

Mr. TAYLOR. Surely.

Commissioner GARRETSON. Has not that type of man been prevalent in the wage system, the one you characterize as a "darn fool"? That is a very charitable name for him, but has he not been almost universal?

Mr. TAYLOR. No, sir; the great majority of this world are right; the great majority of the working people are right, and the great majority of the employers are right. If not, we would have a terrible world to live in. The great majority of people are right.

Commissioner GARRETSON. Has justice been ordinarily maintained in the adjustment of wages?

Mr. TAYLOR. Nine hundred and ninety-nine out of a thousand; it is the thousandth case where it is not maintained. Justice is the universal thing in this world, almost; the injustice is the unusual thing. If it were not so this would be a horrible world to live in. We are tired of slavery. We are on toward democracy.

The CHAIRMAN. Now, Mr. Thompson, I want you to ask the regular questions. I want to say that I wanted to have Mr. Thompson first, but I made a mistake.

(Here the witness stated that he desired certain books, which were produced.)

Mr. THOMPSON. These questions that I intended to ask you were not questions that would depend upon books, although I may touch on them in the questions that I shall ask.

In your address upon the subject of scientific management or efficiency systems, as we call them now, to-day, you said something about the establishment of measures in regard to doing the work, and I will ask you how and what kind of measures are established, whether the work is divided up into basics, day work, or how is it reached in your system generally?

Mr. TAYLOR. What kind of measurement or equitable task?

Mr. THOMPSON. No; as to a piece of work, as a task. What might it be in a specific case?

Mr. TAYLOR. Why, here they are all written out, fortunately, if you want to have an answer to that, here they are in writing, these tasks. Here they are, a lot of written tasks.

Mr. THOMPSON. Let me ask you further, and I will get at it, seeing that you have several methods. Do you use the element of time in arriving at a designation of a task; time measurement, for instance?

Mr. TAYLOR. Every elementary movement of every man has to have its appointed time, its proper time in which it ought to be done.

Mr. THOMPSON. When you say that every elementary movement of a man should be measured, you mean by that that you divide the operation or the task into more detailed parts, and for this part which you call an elementary movement you set a time method?

Mr. TAYLOR. Yes. We make a study of how long it would take to shovel a shovelful into a pile. We make 1,500 observations of a particular thing; we make 1,500 observations of one kind of material, by two or three good men—not poor men—and those are averaged out, and those furnish a foundation time. Then we always add a large percentage to that for unavoidable accidents and delays, and things of that sort.

Mr. THOMPSON. That becomes a foundation for that elementary movement, or code of laws?

Mr. TAYLOR. Yes.

Mr. THOMPSON. And you say that goes practically through all industries?

Mr. TAYLOR. Practically through all the industries.

Mr. THOMPSON. It might be called a basic or general law, perhaps?

Mr. TAYLOR. Those are the laws; the time laws of that industry.

Mr. THOMPSON. When you get to the measurement of the extra time, how do you do there; how is that arrived at?

Mr. TAYLOR. That is arrived at in many ways. For instance, you will have in your establishment a man who is recognized by his fellows as a good worker, a man who, when you stick to him and say "How long have you been at this job?" he says, "Ten or fifteen years." You ask, "Are you working as you think a man ought to work?" He says "Yes." You say "Very well, then; let you and me together examine this and see what you are doing. Let us get at this thing."

When you start in to study that man that way, you say "John, you want to go into this thing with us, don't you? You know what we are after; do you want to go into it?" and he says "Yes," and you say "Very well. While you are doing this it will be an inconvenience to you, and it will be disagreeable, but we will pay you double wages. What we want is your regular standard pace that you find is right, that you agree is right and everybody else will." We study that man's motions, we find the exact time that it takes to do each elementary motion, and then we find that in addition to that, that it is necessary for him to have proper rest periods, and in order that he shall not be forced to work like a slave all the time, morning and night, and never shall be hurried, and that he shall have a certain amount measured for talking with his friends and whatever is right, he should do. There is a certain percentage added on that, never less than 20 per cent, and in some cases 100 to 120 per cent are added to the time in certain instances, but never less than 20 per cent on any job that I have had anything to do with.

Mr. THOMPSON. That extra time is allowed by some one; you need not state by whom.

Mr. TAYLOR. That is part of the laws; it is not allowed by some one else's say so, but it is part of the law.

Mr. THOMPSON. Will you please answer the question? If you haven't an opportunity of answering fully when you have answered the question, you will have an opportunity at the end. So that at first the time study is established by some one?

Mr. TAYLOR. Yes.

Mr. THOMPSON. And then the result of these observations and time studies is crystallized in a sort of law, and the time of the elementary operation, which is a general law, is next established beyond that for the extra time?

Mr. TAYLOR. Percentage allowances, as they are called.

Mr. THOMPSON. Now, there is a payment allotted, is there not, for the doing of this work to the workers?

Mr. TAYLOR. Yes.

Mr. THOMPSON. That is his reason for doing the work?

Mr. TAYLOR. One of his great reasons; yes; 33 $\frac{1}{3}$ per cent.

Mr. THOMPSON. It is a basic law of his work; his compensation?

Mr. TAYLOR. Yes.

Mr. THOMPSON. I do not mean his extra compensation; what he originally gets for his work.

Mr. TAYLOR. Yes.

Mr. THOMPSON. Now, how is the amount of return that he is to get arrived at? First, you say he is to receive $33\frac{1}{3}$ per cent, or whatever that may be, more than he received before. Who determines that what he got before is to be the basis for any computation of increase?

Mr. TAYLOR. Why, when a man, a laborer, comes to one of our establishments he applies to us, and we never take him at less than the working rate of wages there, and we almost always in our establishments say that no man can come to work as a laborer unless he gets a little more than the ruling rate of wages, whatever they may be.

Mr. THOMPSON. That is to say, when he comes to your establishment you say that he shall get the prevailing rate, and if he is working in the factory he gets that prevailing rate plus this additional percentage?

Mr. TAYLOR. Thirty-three and a third per cent. The moment he raises to a higher class of work in our establishments his wages go right up automatically and his base goes on and on and up, and added to the base is $33\frac{1}{3}$ per cent, or up to 100 per cent added on top of that.

Mr. THOMPSON. Assuming that a man is working in one of these factories and your system has been tried out with reference to his particular work and you are ready to establish that rule, who determines whether he shall receive $33\frac{1}{3}$ per cent increase or 100 per cent increase?

Mr. TAYLOR. It is determined entirely upon the character of the work in which he is engaged; it depends on the nature of the occupation.

Mr. THOMPSON. Who decides as to the character of work, determining the rate of percentage?

Mr. TAYLOR. That is done by a series of investigations, as I told you this morning.

Mr. THOMPSON. Who makes the decision?

Mr. TAYLOR. The investigator. No one can do it except the investigator. It is a scientific investigation, just as a man who figures there will be an eclipse of the moon and says it is so-and-so and writes it down; that is the man who determines it.

Mr. THOMPSON. So that you have in your system of efficiency, then, a scale of increases running from $33\frac{1}{3}$ per cent up?

Mr. TAYLOR. Yes.

Mr. THOMPSON. The amount to be paid to the workman, whether it is $33\frac{1}{3}$ per cent or more, is to be determined by an investigator working under certain determinations of his as to the basic rules or laws?

Mr. TAYLOR. Yes.

Mr. THOMPSON. Who hires the investigator?

Mr. TAYLOR. The employers, of course.

Mr. THOMPSON. Who pays the investigator for his work?

Mr. TAYLOR. The employers, naturally. You could not get the workmen to pay for the investigation. It would be unjust to ask them to do that.

Mr. THOMPSON. Who installs the use of your system in a factory or shop?

Mr. TAYLOR. Well, if they are wise they will get a man who has had experience.

Mr. THOMPSON. I do not mean the individual, but is it the owner of the business that installs the system?

Mr. TAYLOR. He gets an outside expert generally.

Mr. THOMPSON. But the owner does it or the proprietor of the business?

Mr. TAYLOR. Surely; yes.

Mr. THOMPSON. If the owner should decide that he did not want your system, it would not be put in—or any other system, any efficiency system?

Mr. TAYLOR. I do not know how you can in any way make a man do what he doesn't want to do.

The CHAIRMAN. Please answer yes or no, and make the answers as short as possible, Mr. Taylor.

Mr. THOMPSON. I also will endeavor to make my questions as short as possible.

Then, it is the owner or proprietor of a shop or a factory, looking over his work, that would decide whether he wants efficiency? He is the one that

would make the judgment, and he would determine as to whether it would be put in the factory or not?

Mr. TAYLOR. Yes.

Mr. THOMPSON. And he would determine what kind of a system he would want to put into use?

Mr. TAYLOR. Yes, perhaps.

Mr. THOMPSON. At least he would determine whom he wanted to consult with reference to a system to be established or put in use?

Mr. TAYLOR. Yes, sir.

Mr. THOMPSON. And either leave that to the judgment of some other man or men, or determine himself what system he wants?

Mr. TAYLOR. Yes.

Mr. THOMPSON. As I understand it, there are various systems of efficiency; is that so?

Mr. TAYLOR. Well, the word "efficiency" has been used in relation to about a thousand different things.

Mr. THOMPSON. Wait a minute—but generally speaking it is understood in regard to this field that you occupy that there is more than one entrant in the field, is there not?

Mr. TAYLOR. More than one person has taken the word "efficiency"; yes.

Mr. THOMPSON. I do not want to quarrel about the word "efficiency," but there are several people from whom a manager or owner of a shop might select as to which he would put into use?

Mr. TAYLOR. Yes.

Mr. THOMPSON. And the selection would rest with him or somebody that he might appoint to make the selection, would it not?

Mr. TAYLOR. Yes.

Mr. THOMPSON. Then, if he appointed a certain system—that is, for instance, he would have investigations made and time studies, etc., by the investigator or a set of investigators—it makes no difference which as to those from which he would make a determination as to the basic law that underlies the operation of a task and determine the wage or remuneration which would go to the worker, and the extent of it. Is that true or not? That is what you have already said.

Mr. TAYLOR. No; we would not make a new investigation; we would use the laws developed in 30 years for that investigation. We would make a brand-new investigation. These laws have been developed, and they are laws or facts.

Mr. THOMPSON. You would take either the result of other investigations which have been crystallized into laws or make new ones?

Mr. TAYLOR. Yes; we take the laws that have been developed in the last 30 years and we use those laws.

Mr. THOMPSON. Then, as a matter of fact, it is the proprietor who would determine upon the introduction of the system, and through him either the laws already formed under your system or laws made from direct studies of his business would be put into operation, which would govern the workman at his task? That is true, is it not?

Mr. TAYLOR. If I understand your question, yes; I think it is. I do not know just what you mean. I can not look into your mind and see just what you mean by those words.

Mr. THOMPSON. As you understand them, that is correct?

Mr. TAYLOR. Yes.

Mr. THOMPSON. In your studies, or in the application of those laws, the individual workman would have no voice in so far as the selection of the system, or in so far as the selection of the investigators who should make the studies, if such investigations should be made, should use, would he?

Mr. TAYLOR. The individual workman, do you mean to say, in Mr. Smith's establishment?

Mr. THOMPSON. Yes.

Mr. TAYLOR. Mr. Smith would not consult his workmen as to what system was going to be introduced?

Mr. THOMPSON. Yes.

Mr. TAYLOR. I can not conceive of such a thing. I do not know, there might be such a thing. I can not understand it. It is to me utterly inconceivable. I have never known of such a system, where a man would start to introduce a system and never consult his own men. There might be such a crazy thing as that done, but I have never heard of it.

Mr. THOMPSON. Then, you would say that it would be a crazy thing for the proprietor to do, to introduce such a system as yours without consulting his men?

Mr. TAYLOR. Why, of course, I would. My gracious alive——

The CHAIRMAN. If that is so, there is no use arguing. Just say that that is the case, and let us save time.

Mr. THOMPSON. Now, when it comes to the determination of the amount of time needed in an elemental operation, you say this would be determined by an investigator. This investigator, you say, is selected by the proprietor or by people appointed by the proprietor, and that he makes these determinations. What voice has the employee in the selection of the investigator who is to determine finally the amount of time that is really required for this elemental operation?

Mr. TAYLOR. Are you assuming, now, Mr. Thompson——

Mr. THOMPSON. Please just answer the question.

Mr. TAYLOR. You are asking me a question that I can not answer. Your question is there, but I do not know what is in your mind.

Mr. THOMPSON. I will restate the question, then, because I do not want to have any doubt about it.

Mr. TAYLOR. I understood the question, but there may be a different meaning in your words, and we are not——

Mr. THOMPSON. Just answer the question as you understand it.

Mr. TAYLOR. Are you assuming that the investigator is going to work here and making a fresh investigation of this man's business? Is that in your mind; or are you assuming that he is going to use these laws or that slide rule that has been 26 years in being established under investigation?

The CHAIRMAN. Read the question to the witness.

(The reporter read the pending question as follows:)

"Mr. THOMPSON. Now, when it comes to the determination of the amount of time needed in an elemental operation, you say this would be determined by an investigator. This investigator, you say, is selected by the proprietor or by people appointed by the proprietor, and that he makes these determinations. What voice has the employee in the selection of the investigator who is to determine finally the amount of time that is really required for this elemental operation?"

Mr. TAYLOR. I want to know whether, in that elemental operation, you have in mind something that has never been determined before—that is, one out of perhaps one hundred things that go on in that establishment—or whether you have the ninety-nine that have been determined and are in this book and in that code of laws? Ninety-nine of those things are in the code of laws, and the hundredth remains to be determined.

Mr. THOMPSON. Of course, that deduction is perhaps arbitrary—that is, that ninety-nine have been determined and that the hundredth has not.

Mr. TAYLOR. I would say that more than ninety-nine have been determined in the art of cutting metals, in the art of machine-shop practice.

Mr. THOMPSON. You stated a short time ago that in the determination of the law which specified the time required for an elemental movement, you have had an investigator—sometimes more than one—appointed, who would make studies up to 1,500 perhaps—studies as to the time required. Now, in the selection of those investigators, if they are needed as an original proposition in any shop you go into, what voice has the employee in the selection of those investigators?

Mr. TAYLOR. Now, what do you mean by the "employee"? What do you mean by that? I do not know what you mean by the "employee."

Mr. THOMPSON. The workman who is being studied.

Mr. TAYLOR. The workman who is being studied?

Mr. THOMPSON. Yes.

Mr. TAYLOR. We always ask for his cooperation. In ninety-nine cases out of a hundred the man who is being studied has the matter put up to him, and we say, "This is what we are after. Do you wish to join us in this?" The man who makes that study is in ninety-nine cases out of a hundred a man who came from the workers, a man whom the workers in the shop have confidence in.

Mr. THOMPSON. I understand, but the workman has not the selection of the investigator, has he?

Mr. TAYLOR. Of the man who is going to investigate him?

Mr. THOMPSON. Yes.

Mr. TAYLOR. No.

Mr. THOMPSON. He has no selection. That is all I want, now.

Now, if there were a difference of opinion between the worker, as to the time that it took to perform this elemental operation, and we will say the proprietor of the establishment, the determination of that time would be made by the investigator, would it not?

Mr. TAYLOR. As a preliminary, it would.

Mr. THOMPSON. Yes.

Mr. TAYLOR. But, on the other hand—

Mr. THOMPSON. Now, just—

Mr. TAYLOR. Let me answer the question.

Mr. THOMPSON. You have answered the question.

Mr. TAYLOR. No; I can not answer the question, one-fourth of it, and let the rest of it go.

Mr. THOMPSON. I will give you an opportunity later to say what you want to.

Mr. TAYLOR. But I can not leave that question one-fourth answered. It is not right to me to leave it in that way. Anything that you give to that workman has to be tried out to the satisfaction of the workmen in the shop.

Mr. THOMPSON. Yes.

Mr. TAYLOR. The first decision, as a preliminary, rests with the proprietor in the shop. I wanted to have that understood right off.

Mr. THOMPSON. Then the workman in the shop has the final say?

Mr. TAYLOR. Yes; it must suit him, and he must say that it is just. As a preliminary, you are quite right; the proprietor has everything to say about it, but the moment he touches it and the man comes out with that time table and he says, "There is your time," and he says, "I can not do it in that time," that must be settled to the satisfaction of the workman, and it does not require any appeal or any question. When any workman says, "I can not do it in that time; show me," he must be shown, and unless he is shown to his satisfaction, you have not scientific management.

Mr. THOMPSON. Yes; he is the final decider, in that he says that that time suits him. That is, he says that it is not too short. It may be too long, but if it is too short, he can say, "I will not do it."

Mr. TAYLOR. The code of laws contains a great many mistakes, but any time he says—

Mr. THOMPSON. I did not ask you about that. I want to get down to facts, and I want to make my own investigations, and if you want anything further you can put it into the record.

Mr. TAYLOR. Yes.

Mr. THOMPSON. Is it not the employee who is the final decider of the time he can take to perform an elemental operation?

Mr. TAYLOR. Yes; it is.

Mr. THOMPSON. Is it?

Mr. TAYLOR. Yes; he has the final determination.

Mr. THOMPSON. Then, if you should go into a new establishment with the 99 laws already established in reference to that business in your book, an employee of that factory would have the right to turn those laws over and say to you and to your men and to the proprietor, "These are all wrong, and I will write new ones for you," and then state the laws as he understood, and the time-work as he understood, they should be applied to the elemental motions?

Mr. TAYLOR. No; he has the right to say, not that they are all wrong, but "This part of the laws is wrong." We will not listen to him if he says they are all wrong. Then we will make an investigation to see whether he is right or wrong, and we prove it in this way.

Mr. THOMPSON. All right, go on.

Mr. TAYLOR. The workman wants to know what he has and what he has not got.

Mr. THOMPSON. But who decides where the workman says to you, "This law is wrong"? Who decides whether or not it is right or wrong?

Mr. TAYLOR. I am trying to tell you, but if you do not let me talk, I can not tell you. If you will let me talk, I can tell you. The workman says, "This law is wrong."

Our answer to that is, "Very well. I am a workman myself. Take my stop watch and I will do this while you time me." He takes the watch and I do the work and he times me, and then I turn to him and I say, "Did I do it in the time?" He says, "Yes." Then I turn to him and say, "Now, you do it and I will hold the watch." Then the workman turns around and I time him while he

goes it, and then we find that the workman is making false motions and is working in an inefficient way and we have a chance to see just what he is doing that is wrong. "You are holding your wrench wrong. If you will study this new and better way of doing this thing you will find you can do it in the time." We are teaching workmen in that way how to do what they are required to do in these operations.

Mr. THOMPSON. Suppose he finally holds his wrench right and it takes more time to do it, who decides whether he took the right time or whether you did?

Mr. TAYLOR. This time has been established by experience in 50 establishments by men of a similar character; and we say, "We will pay your expenses, and you go to the shops and see other men do it."

Mr. THOMPSON. You have not answered my question. I asked you, and you know just what my language means—

Mr. TAYLOR. What is it?

Mr. THOMPSON. You tell that man that he has a wrong action; that he has not done it right; that he is "soldiering" on the time. In other words, you determine—I do not know what you tell a man—

Mr. TAYLOR. No; I do not say that he is "soldiering" at all. I say, "Very likely you are inefficient. You have not yet learned this right." Our men do not "soldier" after they come under this system.

Mr. THOMPSON. But you decide finally whether the workman's objection is well taken to your ruling, do you not?

Mr. TAYLOR. I do not. This code of laws decides it—this code of laws that has been proved to be right decides it.

Mr. THOMPSON. A code of laws is an inanimate thing and can not decide anything.

Mr. TAYLOR. There is nothing in the world more powerful than a code of laws. The whole United States is run by a code of laws. This code of laws that has been developed determines, and we ask these men to go to these various shops and see whether it is right. That is our answer. The code of laws is above all people. That is what I want to impress.

Mr. THOMPSON. But the workman does not recognize that code of laws framed by Mr. Taylor and his associates in several shops as ruling human action.

Mr. TAYLOR. It is not framed by us.

Mr. THOMPSON. If you will just answer my questions, Mr. Taylor, we will save a lot of time.

Mr. TAYLOR. I am trying to answer the best I can.

Mr. THOMPSON. I think not. I am sorry to say that. If this workman goes to the other shops and comes back and says finally to you, "Well, I think that my position with reference to that law is correct," then what do you say?

Mr. TAYLOR. Then we have a very careful investigation made by one, two, or three men, whose judgment I have great confidence in, to go to those and other shops to see whether he is right or wrong.

Mr. THOMPSON. Then, suppose after you have made that investigation and have gone patiently and carefully over that with this man, this man still says to you, "In our judgment you are still wrong," then who decides the matter?

Mr. TAYLOR. I do not think I have ever had that case come up.

Mr. THOMPSON. But if it should come up? I am trying to get at all sides of these matters.

Mr. TAYLOR. Finally justice decides it. Public opinion in the shop decides it. General public opinion of everyone.

Mr. THOMPSON. In whose person resides this capacity to determine exact justice? Does it reside in the workman? Is he able to say that this law is wrong? Or does the proprietor say? Or does the investigator, or investigators, sent into that shop to work out your system decide that question?

Mr. TAYLOR. A combination of all of them settle it. It is a democracy that decides it; a general democracy of the whole thing. It is public opinion of the shop that decides it. If a man continues to kick unjustly—a workman—public opinion of the shop frowns on it.

Mr. THOMPSON. You do not answer the question yet, Mr. Taylor, and I want you to answer it. Suppose that the employees on a given task who do that work in a shop, ten or a dozen men, should say to you that your law is wrong. Then suppose you should say to them, "Go to these other shops where it has been worked." And suppose they should go and should come back and still say to you, "Mr. Taylor, you are wrong." Suppose, then, you should have special investigations made and new tables prepared, and they should still say to you that you are wrong, Mr. Taylor. Do you take what they say then? Do

you write their table? Do their tables become the incarnation of justice, or do you, or somebody for you, somebody representing your system, decide?

Mr. TAYLOR. Which one of those questions would you like me to answer? You have put an inquiry to me containing four or five questions, and I do not know which one of them you desire me to answer. You are asking me four or five questions at once, and I can not answer it until I know which one of them you want me to answer. If you will let me answer in my own way, I will do so; or if you will tell me which one of those questions you want me to answer, I will do my best to answer it.

Mr. THOMPSON. I am only asking you one question, and I will ask the reporter to read it now.

(The reporter repeated the pending question.)

Mr. TAYLOR. You have asked five questions in succession. Which one do you want me to answer? Or, if you will allow me to answer in my own way, I will answer. I want to know which one of those five questions you would like to have me answer.

Mr. THOMPSON. I will ask you: Did you not say a short time ago, when I asked you that if the individual workman disagreed with your table, then you asked him to go to other shops where the table was in operation to see how it worked?

Mr. TAYLOR. Yes.

Mr. THOMPSON. You said that?

Mr. TAYLOR. Yes.

Mr. THOMPSON. Then you did not say, in case he differed with that still, that then you made an investigation with reference to these specific laws, new investigations, and if they were still found to be correct, they were still enforced? Did you not say that?

Mr. TAYLOR. If I find those laws were right and being properly carried out and workmen were working under them in six or eight shops, all of them making good under them, and if I found that those workmen were not overworked, and they were normal workmen, well suited to their jobs, I would say, yes, these laws have been proved, and are correct.

Mr. THOMPSON. After you have done those two things suppose that the men still say that they think the laws laid down by you are not correct and are not the incarnation of justice, who decides it?

Mr. TAYLOR. I tell them that these laws are not laid down by me. These laws are embodied in this trade. These laws have proved themselves for the last 10 years. It is up to you now to show me that they are wrong. I will listen to what you have to say.

Mr. THOMPSON. Suppose they say "We believe they are wrong; we think they are wrong." Then what do you do? Who decides whether they shall work under those laws or not?

Mr. TAYLOR. If we find that in four or five shops many men are working under these laws to their satisfaction, I say there is something wrong with these workmen, then, and I try to persuade them. I tell them to get busy; to see what others have been doing under these laws. I ask them what is the matter with them, and I tell them what other people are doing and have been doing, and for them to climb up and get busy and do the same.

Mr. THOMPSON. But suppose you do not persuade them? Suppose they are still of the opinion that they are right? What is done, and who does it, then?

Mr. TAYLOR. To tell the truth, I do not remember ever to have had such a case as that in my life. I will climb that fence when I get there. I never ran against that. Over and over again I have proved these things to men. I have sent them out to see other people who worked right. I have pointed out that this is so, and I have never met that kind of men. If I meet them, I will know how to deal with them. I can not take a supposititious case that does not exist. As far as I have found it, the mechanics that I have come in contact with and the workmen that I have come in contact with are endowed with a good deal of common sense and a good deal of judgment.

Mr. THOMPSON. Then, so far as I am able to gather, there is no final determining source in your system? Is that correct, Mr. Taylor?

Mr. TAYLOR. Except the gradual evolution of law. These laws are gradually evolved through the cooperation of both sides—not of one side. They build themselves up through the fact that they are giving satisfaction to both sides, and have to repeat it and repeat it and repeat it. That evolves the law. That is the way the common law of the world has been evolved, exactly in the same

way. The laws of this shop are so evolved, just as the common law governing all countries is evolved.

Mr. THOMPSON. I may tell you, Mr. Taylor, that the common law of this country and of England is evolved in many cases, and in most cases, from the judgments of courts and decisions by courts having the power to decide.

I am trying to find out from you a very simple thing. I am trying to find out, when you go into your shop and there is a difference of opinion as to the time taken, who determines it, and you do not seem to be inclined to answer that question. Anything that you would like to say on the subject I should be very pleased to hear.

Mr. TAYLOR. I have tried to make myself clear, that gradually a code of laws is evolved which is satisfactory to both sides, and that both sides submit themselves to those laws; that the manufacturer, the owner of a business, no more dares violate those laws than the workman does to violate those laws; that he refers to this code of laws not as to what he says—he does not say, "This is my judgment;" but he refers to this slide rule, and he says, "There is 30 years of work. I stand on that. It is not a question for me to say. I do not recognize it or fail to recognize it. There is the scientific fact that has been developed. Those are the laws we are working under."

The CHAIRMAN. Let me see if the commission understands the situation. Your answer seems to amount to this, that you have not run across any case in your observation where there was a disagreement as to the length of time in which the task should be done. Is that correct, Mr. Taylor?

Mr. TAYLOR. No final disagreement.

The CHAIRMAN. Let us leave the subject, then, if the commission is satisfied to do so.

There is no objection. Proceed.

Mr. TAYLOR. I should welcome a tribunal, if one could be made, to which you could refer these things.

The CHAIRMAN. You say you would welcome such a tribunal?

Mr. TAYLOR. I would, indeed. I look forward to the day when the United States Government will furnish a tribunal of that sort. Nothing could be better in this world, to develop these laws and make them national laws.

The CHAIRMAN. There are one or two questions that have been evolved that I would like to ask you:

In attaining the increase in production of which you have spoken, to what extent would you say the results are due, divided into these subdivisions: The better planning of the work, the adoption of scientific standards, the utilization of new methods, and the elimination of "soldiering," as you have stated, on the part of the workmen?

Mr. TAYLOR. Of course, that would vary with the condition of the various types of business.

The CHAIRMAN. It would be impossible to make any general answer upon that?

Mr. TAYLOR. No; but in a general way I should say that the immediate putting of the establishment in order—just plain common sense, the simplest kind of horse sense that any fool would have, almost, going into business; the putting it in order; just having things done the same way each time, instead of a new way each time.

The CHAIRMAN. Could you tell to what extent that figures?

Mr. TAYLOR. I was going to say that I have had it produce a 50 per cent increase, just that alone—putting things in order; a 50 per cent increase of output—moving things in the logical way throughout, seeing that they have no false movements, that things are not duplicated, that things are done in an orderly instead of a disorderly way.

The CHAIRMAN. That would include the better planning of the work, the adoption of standards, and the utilization of new methods? All of that would represent about 50 per cent?

Mr. TAYLOR. New methods is another matter.

The CHAIRMAN. Well, then, the other elements mentioned would represent an increase of 50 per cent?

Mr. TAYLOR. Merely the orderly movement of things, to stop disorder and have order in the place of it; that is, what we spend perhaps a year or year and a half on in any establishment.

The CHAIRMAN. And you say that in some places that has amounted to an increase of production of 50 per cent.

Mr. TAYLOR. Yes.

The CHAIRMAN. How much, or could you state how much of a percentage you have found of the increase of production would be due to the utilization of new methods?

Mr. TAYLOR. Methods new to that establishment?

The CHAIRMAN. That would be my idea.

Mr. TAYLOR. Methods new to that establishment, but old in other establishments. As a rule a very large part of the increase comes from that sort of thing; from the use of this slide rule, from the cutting out of a whole lot of foolish movements, movements that were entirely unnecessary, movements that a man is making because of the formation of bad habits, learned when he was young, perhaps; the gradual substitution, where it is a practicable thing, of the movements of the right and left hand at the same time—teaching the man to do something with both of his hands at the same time, instead of doing first this and then that [indicating]. That sort of thing would be perhaps the largest gain.

The CHAIRMAN. Could you estimate the percentage of gain in the same industry, or a typical industry such as you had in your mind when you said that the better planning of the work might result in a 50 per cent increase in production?

Mr. TAYLOR. I could not say that. I could have the matter looked up for you and try to approximate those various things in an establishment if you would like to have me do so.

If you would like to have me go back and look up the records I will do it, but it is hard to do it now. I have never put it exactly on that standpoint.

The CHAIRMAN. Very well, then. I will ask you this question, in the record, and you may give your answer. It will be sent to you:

In attaining to the large increases of production, to what extent are the results due to the better planning of the work, the adoption of standards, and the utilization of new methods, and how largely to the elimination of "soldiering" on the part of the workers?

That will be given to you so that you can analyze it, and if you can, why answer it.

What method, if any, has been adopted to determine whether or not the amount of work required of men is injurious to their health?

Mr. TAYLOR. As far as I know, the method is only that of closely observing the men when they are at their work. In addition to that, however, there are certain laws of fatigue which have been very carefully studied. When we begin in certain industries we can say absolutely certainly that this man will not be overworked, and can not be overworked, and in certain others we can say that they can be overworked. I will tell you by an illustration, if you like—

The CHAIRMAN. I would rather have you refer me to the laws.

Mr. TAYLOR. I will try to tell you what that law is.

The CHAIRMAN. Is it a written law?

Mr. TAYLOR. Yes; it is a written law.

The CHAIRMAN. Could you refer me, first, before you make your explanation, to any volume containing the law?

Mr. TAYLOR. Yes; it is somewhere in this book here.

The CHAIRMAN. It is in your work?

Mr. TAYLOR. Yes; it is here in this book. But I will repeat it very much quicker than I can find it.

If a man is doing very heavy laboring work, and has a load on the end of his arms, a push or a pull, or alternately a push and a pull, that is very heavy laboring; most of it comes on his arms, and if he has 45 pounds load on his arms, he must have a rest 58 per cent of the time. Even a big, powerful man must have that—the dray horseman must have 58 per cent rest.

If that load is reduced on each arm so that, instead of 45 pounds on each arm, it is reduced to 22½, he requires only 42 per cent rest. If that load is reduced to 15 pounds on each arm, he only requires 30 per cent rest.

That is a law carefully laid down, a law of fatigue. He must be free from load for his muscles to recuperate a certain portion of the time, as I have stated. That results from the study of the recuperation of the muscles. Not only that, but these periods of rest must come at quite frequent intervals. It will not do for him to have a load on his arm for four minutes at a time and then rest for four minutes. He must free himself from the 45-pound load oftener than every four minutes if he is going to get through properly with the 58 per cent rest.

The law of cooperation of muscles, and so forth, has been very well settled. I do not mean to say by that that there is not much to learn yet; there is still

a great deal to know, but we investigate overwork in that way, and when I say that men in a machine shop, 14 out of 15 can not be overworked, it is from investigation of the strains that they are under that they can not do it; the periods of rest are a necessity, and they are so frequent, and the stress on the arms and the body is so mild that we can not overwork them. I am saying this advisedly and not from any general talk about it, but from careful investigation. We made careful investigations to see how many men in a machine shop it was possible to overwork, and I find that not 1 in 14 is it possible to overwork.

The CHAIRMAN. Have you stated all the method which now comes to your mind which has been adopted to determine this factor of fatigue?

Mr. TAYLOR. No; there is another class of work. For instance, the young girl, the work of a young girl, who is particularly easily tired and quickly tired. We give her a job to do and then we study her very carefully to see when she shows any signs of nervousness. As soon as fatigue is beginning to show, and when she begins to fall off and wants to talk, we carefully study all that, and from that study we find that no young girl should go for more than an hour and a quarter without a complete rest, and so in our establishment, where we have our way and where we order them to do it, and they generally do it, and if they don't they have to quit, we give 10-minute rest periods every hour and a quarter, and every girl, when they leave the establishment, they go out and talk and get free, and then they come back again. These girls show nervous fatigue, and in that way we find that in eight hours a day it is very difficult to overwork a young girl, which is the one most sensitive and which we have to guard the best. I consider it very, very important that they should have these 10-minute rest periods at the end of every hour and a quarter. Perhaps we are wrong about the hour and a quarter—

The CHAIRMAN. But that is one of the methods you adopt?

Mr. TAYLOR. Yes. Perhaps it ought to be some other period, but that is what we have determined and what we believe to be best, and we find that it generally gives satisfaction to the employees; they are pleased with it. Some of them do not like to leave their work at the end of that time, but we make them. That is where we come in and we make them. We say, "This is the 10-minute rest period, and you can do anything but work in that period; you can go off and rest and talk to some one else, or please yourself in any way you want, but you can not do any work."

The CHAIRMAN. Do you think of any other method that has been adopted, to your knowledge, to ascertain this fact as to whether or not the amount of work required is injurious to health?

Mr. TAYLOR. Well, except to take the statistics of the men who have been working under it, that is all; we study the men. We take the length of time that they have been in the employ, and we see if they are happy, and we have them weighed once in a while to see whether they are going uphill or downhill.

The CHAIRMAN. Is there a definite plan laid out in making that study in your code of laws?

Mr. TAYLOR. Nothing except what I have told you.

The CHAIRMAN. But the laws you mentioned—that is what I am trying to get at. Under your system is there a definite portion of the code devoted to this proposition as to weighing the men?

Mr. TAYLOR. Surely—no; not as to weighing the men; it is only when we suspect that they may be overworked in a line that we weigh them, and then not always, but only when we suspect that there is a possibility of overwork. But as a rule I find, as I have told you, there is a certain pressure pulling or pushing on the arms, and that is a pretty good safeguard for the men, provided you pick the right men; but if you get a light man and have him carry a load of 45 pounds on each arm, that is ridiculous; you will overwork him terrifically; so that we eliminate these men and take the men that are able to stand that.

The CHAIRMAN. That is just about the same as the large horse and the small one?

Mr. TAYLOR. Yes.

The CHAIRMAN. Does that result in lowering the quality of the output?

Mr. TAYLOR. Invariably the output is better. Our statistics show that everywhere we have observed we find that the output is better; we must have better output and we must have better quality. We must have more of it; and more of it without a better quality would be ridiculous; so that you will find, if you read what I have written on the matter, we always begin with quality;

we always begin by saying that a man may not lessen his work, but he is to do that first and give the same or better quality; and then you must never ask a man to do what he has not done before. We see that his quality is held up and that we must get better methods of quality rather than worse.

The CHAIRMAN. What is the result of the wages by employment under the scientific management?

Mr. TAYLOR. From 33 $\frac{1}{3}$ to 100 per cent better, at least. The report of this company shows that the men are getting 73 $\frac{1}{2}$ more—the average of them—73 $\frac{1}{2}$ per cent higher than they did when they came.

Commissioner O'CONNELL. What works was that?

Mr. TAYLOR. The Taber Manufacturing Co.

The CHAIRMAN. To what extent has that resulted, as regards compensation, with higher speed of production when there is such? Can you state that, or is that too broad?

Mr. TAYLOR. I can state it in a general way. I will state that we have never done anything but reduce; we always advocate giving the lowest hours at which a man can do his work; we have never increased the hours of labor, and it is always our tendency to go down; and, I might say, even in our machine shops, in which the output is dependent on the machine rather than on the men, we are seriously thinking of seeing whether it is possible to get down to eight hours in our shops, and away from nine hours, and still compete. You understand, if we can not compete the whole thing falls to pieces; we can not pay the big wages, and we are injuring our men. In certain shops we are making a very great study to see if we can not reduce to eight hours and still maintain such conditions that we can pay the high wages; but we are doing no good to the man if you lower his wages at the same time.

The CHAIRMAN. Are there any statistics in existence showing whether the hours of labor have been reduced by the introduction of scientific management?

Mr. TAYLOR. Not that I know of; but I can assure you that they have been lowered; I have told you some.

The CHAIRMAN. I understand; but I just wanted to know if there was any such information. Now, kindly refer to page 69 of Shop Management.

Mr. TAYLOR. What volume?

The CHAIRMAN. I do not know.

Mr. TAYLOR. There are two editions here; that is the reason I asked that. I will see.

The CHAIRMAN. There is a quotation of this kind: "The writer has seen, however, several times after the introduction of this system the members of labor unions who were working under it leave the union in large number because they found that they could do better under the operation of the system than under the laws of the union."

Is that correctly quoted?

Mr. TAYLOR. Yes.

The CHAIRMAN. Kindly give me a specific instance—that is, the shops and the unions from which they retired.

Mr. TAYLOR. The Midvale Co. and the Bethlehem Steel Works, the Taber Manufacturing Co., and the Link Belt Co.—every company I have ever been in that has been so to a certain extent.

The CHAIRMAN. Mention all that you can remember.

Mr. TAYLOR. From my own personal knowledge, I can say that I believe there are a great many; but those are all the specific instances I have in mind.

The CHAIRMAN. Those are all the specific instances?

Mr. TAYLOR. Yes.

May I justify this and explain that a little further?

The CHAIRMAN. Certainly; make any explanation you like.

Mr. TAYLOR. I want to say this, that so far as I know no one who has ever had anything to do with scientific management has ever in the slightest degree discriminated against a union man or a nonunion man, so far as I know. I never heard of any discrimination one way or the other. The question is never asked, so far as I know, in our establishment, whether a man, when he comes to work, is a union or a nonunion man. We are trying to do identically the same thing that the unions are trying to do for the workingmen; we are after higher wages and we are after shorter hours, and we are after better working conditions. We are after exactly the same things that the unions are after. We can not have any quarrel with the unions; we agree with all these objects, and we have exactly the same objects. But this is an explanation. If a set of

workmen find that they are the best of friends with their employers they do not need to coerce them; and, mind you, I heartily agree with coercion that is necessary with the unions on behalf of the employers sometimes; I am a union man, and all I say is that under our system we have never had a necessity for coercion. We are anxious to do for our men, and we are doing and have done more than any union has done for them; but these men in the unions come to me and say sometimes, "Fred, I am tired of paying these dues. Would you leave the union?" I say that I have never advised them to leave the union or to join it. I say, "If it is better for you to belong to the union, go on; I have nothing to do with that matter." I do not say yes or no to unions in our shops. I do not object to the men belonging to them, but I tell them that they will have to judge for themselves. They say, "I am tired of paying dues when it is not doing anything for me," and they gradually leave; but they leave not in an unfriendly way to the union, and it is an extraordinary fact that has come up in connection with this, and it came up in my early youth, and I would like to tell this, which is to the point. My union friends are horrified that a man leaves the union.

In my youth my mother was a very strong antislavery woman; she was a friend of Lucretia Mott, William Lloyd Garrison, and Charles Sumner, and when I was a little boy I lived with antislavery people, and when Lincoln's proclamation came out I remember distinctly, young as I was, and I remember a great many of these antislavery happenings and their disappointment because it abolished their society. And so with the union people; they are sorry because we are doing more for their men than they, and are sorry we are treating them better and giving them shorter hours, and they feel sad that a man leaves the union for the same reason that these people felt bad because Lincoln issued his antislavery proclamation.

Commissioner WEINSTOCK. Their occupation was gone?

Mr. TAYLOR. Yes, sir; I can not help being amused at that analogy. I remember distinctly. I was only a young boy at the time; but these women had won their cause, and they felt darned sorry about it.

The CHAIRMAN. What provisions are made under scientific management for the proper training of apprentices?

Mr. TAYLOR. Exactly the same as elsewhere; that is to say, we take young fellows in and teach them as they do in any other shop. There is no difference at all; we simply take them and bring them up and teach them; and they receive a teaching that is away beyond any teaching you ever heard of before in your life. These teachers go out and stand at the machine with them, and they really teach them. They are not left to pick up a trade as I was; but these men are real teachers; these men are not bulldozers, but they are friends and they go to a fellow and say, "That isn't right." They say that to a young man or any man where he is inefficient with his machine; they say, "Let me show you," and they stand right there and show them; and if a man gets into difficulty he sends at once for one of these teachers to come and straighten him out, not as a bulldozer, as was the old efficiency idea of having a taskmaster, but as having a friend show him, and the teaching is immense. My boy learned in a year a better trade than I learned in two years, and he will be a better mechanic.

Commissioner O'CONNELL. You think an efficiency system if put into thorough operation would succeed the unions and they would go out of existence?

Mr. TAYLOR. No; I never look for the unions to go out. I am heartily in favor of combinations of men. I do not look for a great modification in the principles of unions as they now exist; they are of necessity largely now fighting organizations; I look for educational institutions, for mutual and helpful institutions; I look for great modifications, but never for the abolition of them. I simply look for a change, that the union shall conform itself to this new idea, the idea of a standard that is over all of us, and a set of laws that will be over all sides.

TESTIMONY OF MR. JOHN F. TOBIN.

The CHAIRMAN. Mr. Thompson, you will kindly interrogate Mr. Tobin, please.

Mr. THOMPSON. Will you please give your name?

Mr. TOBIN. John F. Tobin.

Mr. THOMPSON. And your address and business?

Mr. TOBIN. President of the Boot and Shoe Workers' Union, 246 Summer Street, Boston.

Mr. THOMPSON. How long have you been in that business?

Mr. TOBIN. Since 1895.

Mr. THOMPSON. What are briefly, in a general way, the duties of that position?

Mr. TOBIN. General supervision of the organization, general supervision of our collective agreements, and the management of our union label and office correspondence.

Mr. THOMPSON. The boot and shoe workers represented in your union are mostly in large factories, are they not?

Mr. TOBIN. Large and small.

Mr. THOMPSON. Where machinery is in use?

Mr. TOBIN. Yes.

Mr. THOMPSON. And the product is generally made in parts, is it not?

Mr. TOBIN. In subdivisions, minute subdivisions, hundreds of subdivisions.

Mr. THOMPSON. Generally about how many subdivisions are there to a shoe, if you can say, of any one style?

Mr. TOBIN. Over a thousand.

Mr. THOMPSON. In regard to these operations there is great repetition on the part of the worker of the part of the job that he is doing, is there not?

Mr. TOBIN. The operations, many of them, are reduced to a fraction of a cent, and a small fraction of a cent, per pair; in many cases a fraction of a cent per dozen pairs.

Mr. THOMPSON. No operator on a part of a shoe works on another part?

Mr. TOBIN. No, sir.

Mr. THOMPSON. In other words, he is a highly specialized worker?

Mr. TOBIN. Except it might be in the very smallest factories, he must be a specialist.

Mr. THOMPSON. In the factories in which your workers are located, Mr. Tobin, and where the work is divided into minute parts, wherever it be, have the workers had any experience with efficiency systems?

Mr. TOBIN. With what?

Mr. THOMPSON. So-called efficiency systems.

Mr. TOBIN. Not any of the recognized systems. Efficiency in the shoe trade was developed many years ago through the piecework system. The peculiarity of the shoe business is the high rate of speed at which all of the workers operate. With the possible exception of those very few in the factory who work by the day.

Mr. THOMPSON. What measures of efficiency are used in the highly specialized shoe factories, if you know?

Mr. TOBIN. I will give you my experience. I have not worked in a shoe factory for 25 years, but I worked with my watch constantly before me, and timed myself to a second on each operation, and worked with the view to producing more to-day than I produced yesterday, of my own initiative, expecting and believing that the more work I performed the more compensation I would receive. That is the incentive to all the operatives generally in the shoe trade.

Mr. THOMPSON. Is that true of the trade to-day?

Mr. TOBIN. More so than ever before.

Mr. THOMPSON. Then in the shoe trade the piece-price rule exists?

Mr. TOBIN. Almost exclusively.

Mr. THOMPSON. In the carrying out of that piece-price rule is there any instruction or education of the worker other than his own native ability would dictate?

Mr. TOBIN. There is no necessity for it. The incentive is there. The piecework task is the incentive to high speed.

Mr. THOMPSON. Are you acquainted with the so-called efficiency system, of which Mr. Taylor represents one kind?

Mr. TOBIN. I have tried to study the efficiency systems, but I find the lack of efficiency in presenting them to be an obstacle to understanding them.

Mr. THOMPSON. Have you ever considered either Mr. Taylor's system or any other of the well-known efficiency systems, as they might be applied to the shoe industry?

Mr. TOBIN. I do not see how it would be possible to apply the Taylor system or any other efficiency system that I know of to the shoe business.

Mr. THOMPSON. Why would it be impossible, say, to apply the efficiency system, if you understand it, as you do, to the shoe industry?

Mr. TOBIN. If an inspector or timer were put to the task of supervising any one of the several hundred minute operations, and undertook to teach the operators, he would interfere with the speed of that operative, and the result would be that the operator would be less efficient than before.

Mr. THOMPSON. Why is that? Is it because the operator has formed habits of movement with reference to his work?

Mr. TOBIN. He has formed habits and the work would be performed before the inspector could suggest what was to be done.

Mr. THOMPSON. But I understand that these systems would teach the worker how to hold his tool properly, so that he might operate more speedily. If one were taught, for instance, to hold his tool more properly, might that not increase his speed finally, when he learns exactly the way of holding it?

Mr. TOBIN. That might be true in the machine shop, but it would not apply in the shoe industry. The shoe business is equipped with highly developed and speedy machinery, and there are very few hand tools used.

Mr. THOMPSON. It is true, is it not, that some people are more speedy in the work than others?

Mr. TOBIN. Oh; yes, indeed.

Mr. THOMPSON. Do you believe that any method could be used to teach the people who are slow to increase their speed?

Mr. TOBIN. No; I think the tendency ought to be in the other direction. I think the trade would be vastly benefited by a supervision which would reduce the speed.

Mr. THOMPSON. What is the effect on the workers of the speed they now work at?

Mr. TOBIN. They become highly nervous and their health is affected by the close application.

Mr. THOMPSON. Then you think, instead of introducing a system of efficiency in the boot trade, it would be well to introduce a study of reducing speed so as to preserve the health of the operators? Is that it?

Mr. TOBIN. I think a plan of less work and shorter hours and more pay is to be desired rather than more work for less pay for fewer people.

Commissioner WEINSTOCK. Will you repeat that again?

Mr. TOBIN. I say that it would be better for the shoe trade, and I think also for many other trades, if we were to aim to give less work to more workers for better pay and shorter hours.

Mr. THOMPSON. That is all the questions I care to ask the witness.

The CHAIRMAN. Mr. Garretson, do you care to ask any questions?

Commissioner GARRETSON. No.

Mr. TOBIN. The tendency, as I observe it, under all the efficiency systems I know anything about, including Mr. Taylor's, upon his own statement, is that it seeks to furnish more work for fewer workers for higher wages.

The CHAIRMAN. Mr. Weinstock, have you any questions?

Commissioner WEINSTOCK. Yes; quite a number.

What is the attitude of the shoe workers toward the piecework system—the rank and file?

Mr. TOBIN. They generally favor it.

Commissioner WEINSTOCK. They favor it?

Mr. TOBIN. Yes; with the possible exception of the cutting department, which is the only important department in which daywork is in vogue.

Commissioner WEINSTOCK. The charge has been made that the piecework system develops the muscle rather than the brain, and that it is unfair to put a premium on muscle rather than on brains. What are the facts from your experience?

Mr. TOBIN. There is not very much muscular force required in the shoe business. Speed and brain power are necessary. The muscle, of course, is the reserve force which enables the worker to continue for a longer period of time and to live under the strain for a greater number of years.

Commissioner WEINSTOCK. It is further asserted that any system aside from the daywork system tends to drive a man to work too hard, that more of the workmen work at great speed and more strenuously than in any other country, and that they do this under the ordinary wage system.

Mr. TOBIN. Yes; that is the spur; nothing else; the piecework system.

Commissioner WEINSTOCK. Do you believe that the piecework system tends to drive the mass of workers to work too hard?

Mr. TOBIN. Unquestionably.

Commissioner WEINSTOCK. Then you would not advocate any system that would drive the workers to greater physical exertion than is now exercised?

Mr. TOBIN. I would apply, very possibly, plans to the very opposite direction.

Commissioner WEINSTOCK. You would restrain?

Mr. TOBIN. Restrain.

Commissioner WEINSTOCK. Rather than encourage to do more?

Mr. TOBIN. Yes, sir.

Commissioner WEINSTOCK. It is claimed in relation to the efficiency system that it is based on the theory that so much effort can be gotten out of a man now, regardless of his future physical welfare. Do you know enough of the efficiency system or of the scientific management system to pass judgment on that point?

Mr. TOBIN. That may not be a just charge against the efficiency system. Mr. Taylor absolutely disputes that.

Commissioner WEINSTOCK. It is claimed that our greatest trouble is that young men should be given an opportunity to learn a trade, and that the present system means a finer and finer subdivision of labor, which robs the worker of the possibility of learning a trade.

Mr. TOBIN. We have no trade in the shoe business. It is an opportunity.

Commissioner WEINSTOCK. Is it true of the piecework system that while temporarily increasing earnings, in the long run it cuts the earnings?

Mr. TOBIN. Yes, sir; it does. The wages of the shoe workers of this country to-day, the organized shoe workers—and by that I mean also the unorganized, who are relatively approaching the organized workers—are higher than they have ever been, but their production is much greater.

Commissioner WEINSTOCK. Have their earnings been cut?

Mr. TOBIN. In the sense that their higher speed enables them to produce more.

Commissioner WEINSTOCK. You mean their earnings are not increased in the ratio in which their productive powers are increased?

Mr. TOBIN. They get more dollars per week for producing more shoes per week.

Commissioner WEINSTOCK. Then, if the piecework system has cut their earnings, why should the workers, as you say, favor the piecework system in your trade?

Mr. TOBIN. The trade is overrun with new workers who have not learned by experience the ill effects of the piecework system. You might say that in most of the shoe centers the non-English-speaking foreigner is a very large majority of the workers, and they have very recently broken into the trade—picked it up, as Mr. Taylor picked up his trade. That is possible because of the subdivision, the minute subdivision of the work, and these foreigners getting into the trade induce their relatives to come, in and they teach them at home, or get into some place where they can have an opportunity, or go to a school where they pay any stated sum from \$25 to \$75 for the opportunity to operate a machine for a week or two weeks, and then go out and take a job. So that the men of wide experience in the shoe trade who know the ill effect of high speed are out of the trade eventually, so that the wisdom which they have acquired is not available to the trade. We find, too, that the foreign workman, because of his lower physical standard, is more prone to illness in our trade than the American workman. We spend about \$100,000 a year for sick and death benefits in our organization, as against \$10,000 for strike benefits.

Commissioner WEINSTOCK. Are you sufficiently familiar, as a result of your reading and study and inquiry, with scientific management to determine whether the same objections that you point out hold to the piecework system would also hold to the system of scientific management?

Mr. TOBIN. Not necessarily. I believe that scientific management, so called, has been greatly abused by persons who are not scientific. I do not know whether Mr. Taylor is scientific or not. I am not prepared to say. The chances are that some of his competitors would not agree that he was scientific. There is not any agreement as to what scientific management is—any considerable agreement, I mean. The general tendency of the worker is to believe that scientific management is invented solely for the purpose of increasing production and reducing the cost of production, and that it does not make any provision for displaced workmen.

I might illustrate this statement by a question which I asked of Mr. Taylor at one of the meetings where we happened to both speak.

Speaking of the Midvale Steel Works and the elimination of unskilled labor by several hundred that were displaced because of inefficiency in shoveling rice coal and pig iron, I asked him what became of the men who were displaced, and he said that they were put at other work for which they were mentally and physically fitted. Is that right, Mr. Taylor?

Mr. TAYLOR. Exactly.

Mr. TOBIN. I asked, then, the question as to whether all of the displaced men found employment in the same works for which they were mentally and physically fitted, and he said, "No; not by any means." "Then what eventually does become of the men who are displaced because of your efficiency?" He answered, "That had not been provided for, but in the long run it would be."

Mr. TAYLOR. I would like very much to have an opportunity to tell you what became of those 4,600 workers, at some time.

The CHAIRMAN. Please make a memorandum of this and you can come back and give anything you wish in rebuttal.

Commissioner WEINSTOCK. It is further claimed, Mr. Tobin, that scientific management on the one hand, or piecework on the other hand, destroys collective bargaining, and that it means individual bargaining.

Mr. TOBIN. No; I think the tendency is the other way. It would be almost impossible. Not impossible, but a very difficult task, to operate a shoe factory and make an individual price for each operative.

Commissioner WEINSTOCK. So that, in your trade, it has no effect on collective bargaining?

Mr. TOBIN. No; we find collective bargaining in our trade is much more simple than the individual bargain, because all of the operatives, especially in the larger factories, on a given operation, have a flat price of so much per dozen or so much per hundred pairs. Individuality in the production of a shoe, I might say, is not a factor at all as it was many years ago. The shoe had the character of the workman stamped on it. The machine system has entirely eliminated that.

Commissioner WEINSTOCK. What percentage, so far as you know, of shoe workers employed in shoe factories are members of organized labor?

Mr. TOBIN. Possibly about one-third.

Commissioner WEINSTOCK. They dominate the rest, do they? They fix the prices and the conditions?

Mr. TOBIN. They fix a higher standard, naturally, by reason of being organized; and the unorganized factories must come somewhere near that in order to hold the workmen. In other words, the workmen will go to the factories that offer the best wages, so that the unorganized factory must pay approximately what the others do in order to hold the best workmen.

Commissioner WEINSTOCK. What voice, if any, has the worker in the making of the piece price?

Mr. TOBIN. In the organized factory he has absolutely an equal voice with the employer.

Commissioner WEINSTOCK. The two come together and agree?

Mr. TOBIN. That is a fundamental principle of our organization.

Commissioner WEINSTOCK. And if the two can not agree what happens?

Mr. TOBIN. We go to arbitration, in Massachusetts, through the State board of arbitration; outside of Massachusetts to a local board composed of one representing the employer and one representing the union, the two selecting a third as an umpire.

Commissioner WEINSTOCK. So that in your trade the worker has an equal voice with the employer in fixing the piece price?

Mr. TOBIN. Absolutely.

Commissioner WEINSTOCK. Does it work out satisfactorily?

Mr. TOBIN. It works out satisfactorily. The employer is not permitted under our contract to make any change in wages without the consent of the union. And, on the other hand, the union is not permitted to make any imposition on the employer in the shape of an increased wage without the consent of the employer.

Commissioner WEINSTOCK. And the price that is fixed between the union representative and the employer prevails for union and nonunion workers?

Mr. TOBIN. No; I am speaking now with respect to the collective bargain in factories with which we have contracts—that is, collective bargain contracts, arbitration contracts—but the wages which we fix under that system have a beneficial influence in what are known as nonunion shops.

Commissioner WEINSTOCK. It becomes a standard, practically?

Mr. TOBIN. It becomes something to point to.

Commissioner WEINSTOCK. As a basis?

Mr. TOBIN. On the other hand, too, when the union seeks to establish a price the nonunion prices are pointed to by the employer as the market price, and he endeavors to fix his argument before the arbitrators so as to get the advantage of the lowest price that he can find for the same quality of work.

Commissioner WEINSTOCK. I presume these prices are arrived at as the result of time studies, are they not—of timing the operations?

Mr. TOBIN. Not in the sense that they apply it in the efficiency scheme.

Commissioner WEINSTOCK. Do the workers in your trade object to having a time study applied?

Mr. TOBIN. It is not necessary. The employer knows how many pairs a man produces in a given time. He must know that, because they have a system of coupons on which is marked the number of pairs in a case of shoes. A case of shoes will be 12 pairs, 24 pairs, 36 pairs, or 60 pairs, and a workman does so many pairs a day, and the employer knows that, because the workman hands in his coupon, upon which his wages are based.

Commissioner WEINSTOCK. It is self-operating?

Mr. TOBIN. Yes; and without any additional cost. You can figure up the number of pairs a man has done.

Commissioner WEINSTOCK. And do you have, in addition to the piecework system, any system of bonuses or premiums in your trade?

Mr. TOBIN. A very few shops have. I will mention one shop, the L. Q. White Co., of Bridgewater, Mass. They have a regular union standard wage there.

Commissioner WEINSTOCK. Piecework?

Mr. TOBIN. No; week work; and in addition thereto they pay a bonus which amounts to anywhere from \$10 to \$20 a month per workman for saving stock. In other words, a certain number of feet of stock is allotted a pair of shoes, or a dozen pair of shoes, and if the workman can get out a satisfactory shoe and save stock over and above the allotment of footage allowed for a certain job that is placed to his credit and at the end of the month he receives his check for the amount which he has saved.

Commissioner WEINSTOCK. It is a bonus on the utilization of what otherwise might be waste?

Mr. TOBIN. Exactly. You have stated it very much better than I could state it.

Commissioner WEINSTOCK. Does the union object to that bonus or premium system?

Mr. TOBIN. They have not entered any objection to it, but they do not like the bonus system. Applied in that way they do not object to it, but the bonus system is calculated, as generally applied, as is the profit-sharing system, to develop a speed that is too high.

Commissioner WEINSTOCK. To overstimulation?

Mr. TOBIN. Yes; that is the objection.

Commissioner GARRETSON. Mr. Tobin, you have dealt for many years with the piecework system?

Mr. TOBIN. Yes. I have worked at it and under it.

Commissioner GARRETSON. In your opinion, is the piecework system, or is it not, an agency that—I am using a piecework price in the sense of wage—decreases wages while increasing earnings, or does it work that way?

Mr. TOBIN. It does work that way, absolutely.

Commissioner GARRETSON. That is all.

Mr. LENNON. Mr. Tobin, do the members of your union and the shoe workers generally turn out more work now for a dollar than they did in 1900, say?

Mr. TOBIN. Yes, indeed; very much more.

Commissioner LENNON. Then, while you earn more money because of the different manner of operating the factory, you have not had any increase in real wage, when it is compared with the production?

Mr. TOBIN. Well, do not misunderstand me. I say that the individual worker is now receiving the highest wage in the history of the trade; but that the whole cost of producing a shoe is less now than ever before.

Commissioner WEINSTOCK. Would you say that he is getting a higher wage, or that he is getting the highest earning power?

Mr. TOBIN. The highest earnings.

Commissioner WEINSTOCK. It is not a wage, it is really an earning power?

Mr. TOBIN. Earnings; yes.

Commissioner LENNON. Would you not consider this an evidence of the introduction of substantial efficiency in the shoe business?

Mr. TOBIN. Oh, we have efficiency beat, as far as any system of efficiency that I have heard of is concerned. They are away behind the times when applied to the shoe trade. They would starve to death in a shoe factory.

Commissioner COMMONS. You doubted whether you knew what scientific management meant, but you probably do know the difference between a premium system and a piecework system?

Mr. TOBIN. Oh, yes.

Commissioner COMMONS. Which speeds the men more?

Mr. TOBIN. One speeds them up to the top notch, and the other one a little further.

Commissioner COMMONS. Which is which?

Mr. TOBIN. The premium is on top of the piece system. The premium system comes after the piece system, and is an attempt to get a little more speed. It is the highest speed on the machines.

Commissioner COMMONS. It is a higher speeder than the piece system?

Mr. TOBIN. Yes.

Commissioner COMMONS. How do you figure that out?

Mr. TOBIN. The very nature of the term indicates that; because, what incentive would the employer have to give a premium if there was nothing to be gained by it?

Commissioner COMMONS. What incentive would he have for piecework rather than daywork, except that the man will speed up more and get more pieces out?

Mr. TOBIN. Exactly. Then if you put on a premium system and then put on a bonus system on top of that again, you might get, possibly, a little more speed.

Commissioner COMMONS. If you will allow me, I think you do not understand the premium system.

Mr. TOBIN. Possibly not.

Mr. BARTH. He does not. Mighty few people do. I want to emphasize that and protest—

Commissioner COMMONS. Well, do not get excited.

Mr. BARTH. I protest, when a fellow that does know about it is sitting quietly—

Commissioner COMMONS. I think, perhaps, Mr. Tobin does know about it, but he has not thought in what way the term is used.

Take a piece that you are getting out at the rate of 100 a day, and at 5 cents apiece. In a day you would make \$5?

Mr. TOBIN. Yes.

Commissioner COMMONS. Under this premium system they put it up to you in this way: Five dollars is your daily wage; your task is 100 pieces. That comes out the same way, does it not—5 cents?

Mr. TOBIN. Yes.

Commissioner COMMONS. But for every piece over 100 we will not give you 5 cents—

Mr. TOBIN (interposing). We will give you 4?

Commissioner COMMONS (continuing)—as we do in the piecework system, but we will give you, say, 2 cents. Which speeds the man the more? Is it not more of an incentive to the man to speed up where he is going after 5 cents than it is when he is going after 2 cents?

Mr. TOBIN. But, as I understand the premium system—this gentleman may know more about it than I do, but I have seen its application—just as you see, say there is 5 cents apiece and for all over 100 we get 4 cents apiece. That means that when a man has done 100 pieces he has reached the limit for that day at the standard price of 5 cents apiece, and if he runs over that and does a few more he gets at the rate of 4 cents apiece for that additional number. That is my understanding of the premium system.

Commissioner COMMONS. Whereas in the piecework system it would be 5 cents?

Mr. TOBIN. It would be 5 cents all the way through; if he did 100 or 150 it would be a flat 5 cents apiece. If that is not the premium system, then I do not know anything about it.

Commissioner COMMONS. That is what I intended to define as the premium system, except with respect to this: That under the premium system, as a minimum, he is not supposed to get less than \$5, even though he produces less than 100 pieces.

Mr. TOBIN. Yes; but you, of course, appreciate the fact that the employer has no purpose in offering that premium unless it is going to accrue to his advantage in some way.

Commissioner COMMONS. He is trying to get them to get up to 100?

Mr. TOBIN. Yes.

Commissioner COMMONS. But he is also offering them a premium above that to get them above that; that is where they get this 30 per cent.

Mr. TOBIN. That is not the worst of it. Eventually the price at which he does all over 100 is offered as the standard price. Instead of getting the 5 cents for all he did up to 100, after he has developed the fact that he can do more than 100, by reason of the premium system, then he is offered a price of 4 cents; and he has to do the whole amount, over and above the 100, for less than he formerly received. That is the way the premium system works out.

Commissioner COMMONS. He get a less rate?

Mr. TOBIN. Yes.

Commissioner COMMONS. Would there not be, under the premium system, more of an inducement to stop at 100 than there would be under the piece system?

Mr. TOBIN. If he had any sense at all, yes; but most of the workers in that respect are not farsighted.

Commissioner COMMONS. Do they not know the difference between 4 cents and 5 cents?

Mr. TOBIN. Yes; they do, after it comes home to them good and hard.

Commissioner COMMONS. Would they not work for 5 cents more than they would for 4 cents?

Mr. TOBIN. I have not seen that yet. They work for 5 cents, and will do the 100, and after they get the 100 done, they try to do another hundred.

Commissioner COMMONS. No matter what the price?

Mr. TOBIN. At any price over and above the 5.

Commissioner COMMONS. Suppose you put it down to 2 cents, as I said: Five cents up to 100, and then 2 cents.

Mr. TOBIN. You can get any quantity of men to do it, unfortunately.

Commissioner COMMONS. Then you do not see any difference in the intensity of the inducement to speed up beyond that standard day's amount?

Mr. TOBIN. Well, the inducement is there. That is what it is offered for.

Commissioner COMMONS. One other question: Do you see any reason why your collective bargain in the piecework system would not operate just as well under the premium system?

Mr. TOBIN. We would not follow the premium system at all.

Commissioner COMMONS. Well, if you were making piece rates by collective bargaining you could establish a premium rate by collective bargaining, could you not?

Mr. TOBIN. I have never thought of that as a practical thing to do.

Commissioner COMMONS. That has never been put up to you?

Mr. TOBIN. No.

Commissioner COMMONS. Do you see any essential difference between the two, so far as agreeing is concerned?

Mr. TOBIN. It ceases to be a premium system when you apply a flat rate; the premium system, as I understand it, is something over and above what a man may do after he has done his normal day's work, estimated, and that is

Commissioner COMMONS. Well, you could agree on what it should be, whether it should be 2 or 3 instead of 5 cents; you could agree on what should be the task.

Mr. TOBIN. We have to deal with conditions as you find them. If you make a wage to-day on a new operation, it looks like a fair wage to-day, at the speed at which the workmen are producing that thing; we find that in a month from now or six months from now the production is so great that the price is apparently out of joint with the volume of work; that would call for a new adjustment. In other words, the employer is always keeping his eyes open to see what the workmen are making at normal wages, and when that is discovered he immediately raises the question of the price.

Commissioner COMMONS. And then what happens?

Mr. TOBIN. The question of price being raised, negotiations are entered into to settle the price by mutual agreement, and failing to settle the price by mutual agreement it is arbitrated.

Commissioner COMMONS. If you had piece rates reduced by arbitration—have you had those rates reduced by arbitration?

Mr. TOBIN. We have at times; yes. A new operation is very apt to be set at a price that is wrong; the newness of the operation to the workmen, of course, is in evidence, and what seems a big task to-day in a month from now is a very small task. I can remember in my own experience working in the factory, I used to think that if I could trim a hundred pairs of edges in a day I was doing a good day's work. I saw the time later on when I could trim that many from noon up to the time of going to a ball game in the afternoon; in other words, I had done a full day's work after dinner. That gives you an idea of how speed can be developed. And I used to think that 200 pairs was a phenomenal day's work, but I have seen the time when I have done 600 pairs afterwards, and that has resulted from the change in the wages.

Commissioner COMMONS. The point I wanted to get at was the question of readjusting the premium rate; the task is exactly the same, and to be referred to an arbitrator as a problem of reducing the piece rate.

Mr. TOBIN. I have never had any experience with a premium in that way; the premium has been offered by the employer for what is considered, what we consider, an ulterior purpose, and we have never recognized it as a legitimate part of the trade, although the bonus system, as I have described in the particular factory to which I have referred, we have not objected to that because it is paid entirely for the saving of stock.

Commissioner DELANO. I wanted to ask whether there was anything in what you have expressed that is at variance, in your mind, with the principles which Mr. Taylor has laid down. I do not mean the application of those principles, but the principles which he has laid down as expressed this morning?

Mr. TOBIN. Well, I am not going to condemn any system that I do not understand, and I confess that I have not been able to follow these sliding rules, or to follow the claims made by Mr. Taylor and those who speak for him.

Commissioner DELANO. Not in regard to sliding rules or anything of that kind; those are applications of principles. He has laid down certain principles as essential; is there anything in your thought that is at variance with those principles? I am assuming that you were here this morning.

Mr. TOBIN. Yes; I was here this morning. I would not say at this stage that I subscribe to Mr. Taylor's efficiency plan any more than I would subscribe to an efficiency plan of any other man who may be superior to or an imitator of Mr. Taylor.

Commissioner DELANO. There, again, you are talking about the application. I want to get your view on the principle and not on the application.

Commissioner WEINSTOCK. May I suggest, Mr. Delano, that Mr. Taylor's principle, as I understand it, resolves itself down into three factors: (a) Higher earnings for the workmen, (b) shorter hours, (c) better working conditions.

Commissioner DELANO. I think there are certain other principles; one of them is that there shall be cooperation and harmony between the management and the workers. I think this whole subject is misstated and misunderstood quite as much by Mr. Taylor, and a great deal more by the employers than by the employees. I want to get at whether you are at variance with the principle.

Mr. TOBIN. I think the employer is the greatest obstacle to the introduction of a rational efficiency system; the employer busies himself altogether with profits; he does not concern himself about the greater comfort of the workman unless his profit goes with it. I am speaking of the average employer, not of the exceptional one.

Commissioner DELANO. That would be contrary to the principles Mr. Taylor has laid down.

Mr. TOBIN. That would be contrary to what Mr. Taylor claims for the principles, and he has difficulty with the employer in getting those principles into operation, as he describes, very emphatically, and that is one of the things that is going to stand in the way of this efficiency, which is going to solve this question of relations between employer and workman, that the employer is quite as much an obstacle as the employee.

Commissioner DELANO. One of the duties this commission has is to find avenues of cooperation. We have first to find out where the employer and employee differ, and try to find a common ground on which they can meet.

Mr. TOBIN. Let me make this suggestion to the commission, that much time will be saved and greater results will be secured if the principles of collective bargaining can be established, that employers as well as workmen can be brought to understand what is implied and intended by collective bargaining.

Mr. Thompson, I think, endeavored to bring that point out in the questions to Mr. Taylor, in endeavoring to determine what the workmen had to say finally with reference to the plan which was laid out under which he was to work. Any plan that does not take into consideration the worker in his individual and collective capacity and in his right to bargain with his employer upon an equal basis, an absolutely equal basis, will be faulty. No scheme, in my opinion, of promoting industrial peace will be possible unless that principle can be worked out, not in a superficial way, but in such a way as absolutely and completely to recognize that power. The old-fashioned idea of the right of the employer to decide what a workman is worth—it is only a few years ago that employers would take that position—one of the greatest tasks which I have had in my work, which I did not mention at all when I was asked what my duties were as general president, has been to get employers to understand that under our arbitration contract he surrenders the right to determine the individual's wage, or what a man is worth. In the beginning they would set up an argument with me, "I hire a man, and I observe his work and I see his quality and quantity, and I am the best judge as to what that man is worth." And the only way I can combat that line of reasoning is by asking him if he was willing to concede to the employee the same right that he claimed for himself, and he said "Yes."

I said, "Suppose an employee or a collection of employees should say to you that your estimate of their worth is wrong and that they should stop work for the purpose of emphasizing their protest as against your decision as to what they are worth, what would you do?" He said, "Well, then, your union would be violating your contract with me, because you agreed not to strike or to stop work pending an adjustment of any dispute." "That is exactly our obligation to you and we can not maintain our obligation to you as long as you deny the operation of that principle to your workmen. The workman has just as much right to decide what he is worth as you have, no less and no more; and your estimate of the man's worth to you we will take for what it is worth; we are not satisfied with your estimate, and we will put you to the task of proving that you are right." That is the whole sum and substance of collective bargaining.

Commissioner DELANO. I did not understand anything Mr. Taylor said to be contrary to that.

Mr. TOBIN. I am not antagonizing Mr. Taylor's position at all.

Commissioner DELANO. What seemed to be in your mind when you first addressed us was that the machinery in the shoe business was already oversped, and that any scientific study would result in still further speeding it up.

Mr. TOBIN. No; I didn't say that.

Commissioner DELANO. That seemed to be in your mind. If that is not your opinion I want to be sure what it is.

Mr. TOBIN. No; my statement was that there can be no doubt that Mr. Taylor would starve to death in a shoe factory, because his system would be outstripped by the efficiency system already there.

Commissioner DELANO. You are not willing to concede that a scientific study of the business might not prove that the machines were already oversped, and that therefore human endeavor resulted in less output by reason of unscientific methods?

Mr. TOBIN. No; I do not think that would be the case. Mr. Taylor's illustration of overspeeding in a machine shop, and in the cutting of metal with tools, has a direct application, but that would not apply in a shoe factory at all.

Commissioner DELANO. And why is that?

Mr. TOBIN. Well, a sewing machine will stitch shoes with the greatest perfection at its highest speed, more so than at a lower rate of speed. That would not be true in a turning lathe. That would be true in polishing, but not in turning.

Commissioner BALLARD. You were saying that sometimes the workmen, owing to high speed in piecework, were nervous. Do you find that the workmen in a shoe factory have, as a rule, less good health and shorter lives than those in other industries in the same section?

Mr. TOBIN. Yes; I believe that to be true. Of course, that is offset to some extent by reason of the fact that the shoe workers work short hours.

Commissioner BALLARD. About what hours do the shoe workers work?

Mr. TOBIN. Many of the pieceworkers work about 7 or 8 hours, although the 9-hour day is the shortest day we have in the trade.

Commissioner BALLARD. About what wages do they make?

Mr. TOBIN. Well, that is a variable quantity.

Commissioner BALLARD. What are the average wages?

Mr. TOBIN. It would be impossible to make an average wage. I should say that the latter, which is one of the most important branches of the trade, and less subdivided—they earn anything from \$15 to \$25 a week. A Goodyear operator, what we call a hand seamer, will make from \$25 to \$40 a week; a Goodyear stitcher will earn \$20 to \$35 a week. Table girls, doing the very smallest operation in the shoe factory, will make some of them anywhere from \$8 to \$15 a week. Vampers, which is the highest skilled job in the fitting of a shoe in the women's department—and, by the way, there are a good many men employed at that branch of the trade—they will make \$18 to \$30 a week.

Commissioner BALLARD. And they work fairly steady?

Mr. TOBIN. Yes. The shoe trade is divided into two principal seasons. There are a few weeks in between where the work is rather slack.

Commissioner BALLARD. You spoke of collective bargaining and the right of the workmen to be heard in this collective bargaining. Do you feel that some group of employers and some group of employees might agree on some fundamental principles which should obtain in the relations of the unions with the employers? Have you ever felt that there are certain underlying principles which should obtain, that each side should mutually agree that they had a right to? You said that the former manufacturer did not think that the workman had any interest or any right in fixing his own wage.

Mr. TOBIN. Yes.

Commissioner BALLARD. Do you think if any such proposition as that could be mutually agreed to between the contending parties—do you think that would have some effect?

Mr. TOBIN. That is precisely what we have done by our arbitration contracts, and in the earlier stages of the contract the employer was not willing to concede all the things that the contract stands for.

Commissioner BALLARD. You think if some fundamental things could be agreed on there would be an advantage?

Mr. TOBIN. These are now pretty well established. The employer has begun to see that they work out as we understood it. In the first place, the employer making this contract possibly made it with a view of eliminating labor troubles, and sought to take to himself certain privileges which he was not willing to concede to the other side. Our contract was drawn in such a way as to impose mutual obligations, and we had our method of interpreting the contract, and it took us some time to get the employers generally to agree that we had the right interpretation of it. That we have now well established; the same contract, practically, but a better understanding of the relations between employer and workmen.

Commissioner BALLARD. You do not refuse to use nonunion-made materials or nonunion-made tools, do you?

Mr. TOBIN. The question sometimes arises, but it is not a serious question to-day.

Commissioner BALLARD. It is probably more serious with the employer?

Mr. TOBIN. We sometimes use nonunion leather; and sometimes the machinists want us to insist that we shall employ union machinists in the factory. We tell the machinists we are willing to cooperate with them in that direction, and ask them to see that the machinists who are members of the union do not work in nonunion factories. We have endeavored to cooperate in that way.

Commissioner O'CONNELL. Do the styles change with the seasons?

Mr. TOBIN. Yes. A manufacturer gets out a new style as a leader, and if it takes he gets the bulk of the business that year, or that season; the next season that style is generally followed in the shoe trade.

Commissioner O'CONNELL. Do the prices on the shoes vary with the styles, or does not that make any difference?

Mr. TOBIN. The price of making it?

Commissioner O'CONNELL. The prices for making.

Mr. TOBIN. Well, some prices will. The prices of cutting will. If they were cut by the piece, but not by the day; it is a question as to the number of pairs they are required to cut.

Commissioner O'CONNELL. That is one of the reasons why the standard rules would not apply?

Mr. TOBIN. No; the sliding rule would not apply to those cases at all.

Commissioner O'CONNELL. There would be changes; there would have to be changes now and then?

Mr. TOBIN. Yes.

Commissioner O'CONNELL. That is, 6 and 6 would not always make 12?

Mr. TOBIN. No.

Commissioner O'CONNELL. It would make 13, sometimes?

Mr. TOBIN. Yes.

Commissioner O'CONNELL. You consider it bargaining if, as Mr. Taylor said, one of his men went into the shop and said "We are going to try something new with you, and we want you to cooperate with us." Do you call that cooperation, bargaining in that sense?

Mr. TOBIN. That would be individual bargaining, which we would not consider in harmony with our contract.

Commissioner O'CONNELL. That would not be a contractual relation with the employers?

Mr. TOBIN. No; a proposition of that kind in a shoe factory would be equivalent to offering a man a bonus for making himself a pacemaker; we have plenty of pacemakers; we do not need to hire them especially.

The CHAIRMAN. Mr. Barnett, do you want to ask Mr. Tobin any questions?

Mr. BARNETT. No.

Commissioner WEINSTOCK. Is there any tendency on the part of the unions in the shoe trade to limit the output of the individual?

Mr. TOBIN. Absolutely none.

Commissioner WEINSTOCK. Each man has full and free play?

Mr. TOBIN. Well, circumscribed only by the fact that the owners determine how many pairs he will make in his factory each day. We have a sheet system, and so many pairs go in each day, and there are so many workmen, and the theory is to divide it equally between the workmen.

Commissioner WEINSTOCK. There is no scheme of limitation?

Mr. TOBIN. No; I wish there were; there is absolutely none at all; the very sky is the limit, and perhaps more.

Commissioner WEINSTOCK. Under the system you are operating, the contract system and your arbitration tribunal to adjust disputed prices, what has been the degree of industrial peace in the trade in the last five years as compared with the degree of industrial peace that existed in the preceding five years?

Mr. TOBIN. It has been something marvelous. I might say that in the fiscal year ended May 31, 1909, our total expenditure for that year for strike benefits was \$100,000.

Commissioner WEINSTOCK. In 1909?

Mr. TOBIN. Yes; and the next following year it was \$28,000; and last year it was \$8,000.

Commissioner WEINSTOCK. It fluctuates?

Mr. TOBIN. It fluctuates, and the tendency is under these contracts we have to eliminate the strike altogether.

Commissioner WEINSTOCK. The tendency is that way?

Mr. TOBIN. Yes; we have not a single strike under our jurisdiction now.

Commissioner WEINSTOCK. Looking ahead for the next five years what do you forecast is likely to be the condition of industrial peace?

Mr. TOBIN. I think that it is going to be greater than at any time in the past; there is every evidence of that.

Commissioner WEINSTOCK. That is, the degree of industrial peace will be higher?

Mr. TOBIN. Yes.

Commissioner WEINSTOCK. And strikes will be fewer?

Mr. TOBIN. Yes; we have very few strikes in our trade, and I attribute that largely to the fact that we approach the wage question in an open way, and each side is very free to present arguments for either side.

Commissioner WEINSTOCK. You then believe that the so-called missing link between capital and labor lies in both sides being thoroughly organized, and in the establishment of trade agreements?

Mr. TOBIN. Yes; I think that is a very long step in that direction; I do not say that is going to be a millenium, but it is the best present-day method that I know of.

Commissioner WEINSTOCK. By mutual organization and trade agreements?

Mr. TOBIN. Yes; and mutual recognition without any reservation at all on the part of the employer as to the right of the workman, and the limitation of

the employer's attitude generally of believing that the working man is too ignorant to negotiate prices. That is the mental attitude of some employers and we have had an awful time to get them away from that, but we are gradually getting them away from that idea. I find that the employer is not any better mentally, not any better able to deal with the question of wages and conditions of labor than the workingman, notwithstanding his superior opportunities.

Commissioner WEINSTOCK. Is the worker really a closer student of these economic phases?

Mr. TOBIN. The worker is a closer student, and man for man, can outstrip the employers in stating the logical reasons of their position.

Commissioner WEINSTOCK. One question in regard to the figures which you named. You said \$90 and \$100. I think you meant \$100,000, did you not, when you came down to later years?

Mr. TOBIN. No; I meant \$100.

Commissioner WEINSTOCK. You said the next thing was \$60 and the next \$80, and I thought you were coming along down.

Mr. TOBIN. No; I just mentioned that year because it was a phenomenal year, while our sick and death benefits average about \$90,000 a year for the 10 years.

TESTIMONY OF MR. HARRINGTON EMERSON.

Mr. THOMPSON. Mr. Emerson has prepared, as I understand, a statement of his system, which has been presented to the commission. I would like to have the commission understand that this is to become a part of the record, and if that is proper, I should like to have it so ordered.

The CHAIRMAN. I was going to make that suggestion. I was going to acknowledge this very well-gotten-up statement, which I understood to be his testimony for this hearing, and it will be made a part of our record just as though it had all been testified to upon the witness stand.

You have heard this discussion by Messrs. Taylor and Tobin, and if there are any points not covered in the statement originally submitted by you, will you be kind enough to give us anything that will throw further light upon the matter?

Mr. THOMPSON. I should like to make this suggestion for the purpose of the record here: As it may not appear in the statement he has prepared, I should like to have the witness requested to give his name and address and business and the length of time he has been in that business. I should like to have him make just a brief statement.

The CHAIRMAN. You may ask the questions to elicit that.

Mr. THOMPSON. Will you kindly give your name and address and your business?

Mr. EMERSON. Harrington Emerson. I have assumed the title of standard of practice and efficiency engineer.

Mr. THOMPSON. How long have you been engaged in that work?

Mr. EMERSON. On and off for the last 40 years.

Mr. THOMPSON. You maintain an office for the purpose of carrying out that work?

Mr. EMERSON. I do; in New York.

Mr. THOMPSON. Do you employ assistants for that work?

Mr. EMERSON. I have between 30 and 40 assistants.

Mr. THOMPSON. Do you apply that system in the establishments of your clients, upon compensation?

Mr. EMERSON. We have no system. What we attempt to do is to apply certain principles. We are willing to adopt any method, any device, if it is advantageous, but we have no such system.

Mr. THOMPSON. You apply that upon the request of clients of your office? You apply those principles in their establishments?

Mr. EMERSON. Yes. The client generally comes to us and wants to know what we can do, and then we have a long task in persuading him to consider principles. Our difficulty is always with the managers.

Mr. THOMPSON. How long have you maintained your office in New York City?

Mr. EMERSON. Since 1907.

Mr. THOMPSON. I do not know, Mr. Emerson, whether your book states the number of places in which you have put into operation a system or the principles in operation. If not, will you state, as it comes to you, about where your principles have been put in operation and when?

Mr. EMERSON. We have been consulted by about 200 different firms, and a consultation sometimes extends very far down into their management, and sometimes it is limited to conference with the heads of the firm. The work has been put into a number of different plants rather thoroughly. In no single plant has it been put in absolutely as we would like to see it, from beginning to end, but so far as our advice or the application of our principles is concerned, it has run from very little down to very intense application of what we believe to be the proper principles. All together, perhaps we have advised clients who employed over 200,000 men on the whole, and our work has been applied to nearly 50,000 men, more or less, to a greater or less degree.

Mr. THOMPSON. Could you furnish this commission at some time with a list of those places, and would you be willing to do so?

Mr. EMERSON. Very often our clients object very much to having it known that they have needed any doctor. There are others who are perfectly willing to have that information furnished. As to those I would have no objection whatever to furnishing it, and as to the others it is more or less a confidential relation.

Mr. THOMPSON. We will be pleased to have those who are willing to have you furnish it, and we will make the information so furnished a part of the record in this case.

Mr. EMERSON. Yes.

Mr. THOMPSON. Will you kindly answer the question which the chairman asked you in the beginning, if you remember it?

The CHAIRMAN. What I asked Mr. Emerson was whether there were any points not mentioned in his written statement which he thought might throw light upon the question of efficiency as applied to labor.

Mr. EMERSON. I do not know that there is any question of that kind. It has seemed to me this afternoon that on both sides the subject was perhaps not understood, or there seemed to be misconceptions as to what the aims were.

Let us take up the matter of the determination of the standard. That was one of the matters that was discussed by Mr. Taylor. We feel that the test of a standard lies ultimately absolutely with the worker. If a worker attains a standard without overspeeding and without undue strenuousness, that in itself justifies the standard. There is no penalty whatever imposed on a man who does not attain the standard.

Under the method that I prefer, the man is always guaranteed his day wages. That is fundamental, irrespective of what he accomplishes. The mere fact that he comes and offers his time entitles him to his wage. I consider the management always responsible for anything that goes wrong in a plant. I have never considered the worker responsible. If the worker is not furnished the work, it is the fault of the management, and he should not be made to suffer. That is the reason I am absolutely, wholly opposed to piecework. I always have been, for the last 10 years. Ten years ago I denounced piece rates, and I have constantly worked and written and struggled against piece rates ever since. Piece rates impose responsibility on the worker, and the worker has only small authority. The responsibility of what is going on rests with the management to an extent of 90 per cent.

Under the method I use, we therefore pay a fixed day rate. That rate is properly subject to bargaining, either individual or collective.

The second principle we use as to payment is that there shall be a determined equivalent for a day's work, and that equivalent should be determined by a scientific expert, neither by the management nor by the worker, and yet it should be accepted by both before it becomes valid. As you have it now, there are the two fixed principles of a fixed rate of pay per day, and the equivalent for that rate. In other words, a bushel consists of 60 pounds. You have a definite equivalent for what the day rate is.

Now, men vary very much in their abilities, in their speed, and under our plan there are many men who attain what we would call 80 per cent efficiency, and there are other men who attain 120 per cent efficiency. Instead of their all attaining exactly 100, they vary. We would expect, as a test of our standard, that there should be some few men as low as 80 per cent, and that there would be some few men as high as 120 per cent; that is, the bulk of the men would rank somewhere between 90 and 110 per cent. We feel that the man who has it in him to deliver 120 per cent should receive an individual reward on account of that. We should not, by any possibility, dispense with the man who attains 80 per cent, because it is absolutely his right to stay on the 80 per cent level. I would even go further; I would allow the man who has 120 per cent ability

to shorten his hours, if he saw fit. He could work 8 hours a day instead of working 10 hours. That would be at his option. The determination of the standard is, of course, the basis of the fairness of the relations between the employer and the employee. As a rough check on a standard, we make it one-half of what a man can attain by a stunt record, that we call 100 per cent. To illustrate what I mean by that, the athletic record for walking is 8 miles in an hour. That is the world's record for walking. We would set 4 miles an hour as a good, stiff performance, and if a man walks more than that he would be paid accordingly. We would not think of discharging a man who walks as little as $2\frac{1}{2}$ miles an hour.

Now, if a man feels for any reason that he is not treated fairly, if we should attempt in any way to cut the standard, we would suffer far more than the man, because if he dropped back from 100 per cent to 80 per cent, still earning his day rate, the loss to the manager would be far greater than the loss to the workman, so that that stands absolutely as a barrier against any cut in the standard. Moreover, what we do is to check up the actual performances under the standards through a long course of time, as has been done by different men on different occasions, and if we do find that a performance the standard of which has been six and seven-tenths hours a day regularly takes six and nine-tenths hours, we come to the conclusion that that standard was too severe, and that it ought to be ameliorated, that it ought to be changed, that it ought to be made easier. The one intention is that the standard shall be fair, and when that is understood by both employer and employee—and I have had just as much trouble getting the employer to understand the point of view as the employee—when that relation is established there is very little difficulty in changing the standard one way or the other, in order to be fair.

I remember a worker that came to my brother; we had established a standard of three and seven-eighths hours for a machine-shop operation, and he said to him, "The first time I did that it took me three and six-tenths hours, and the next time I did it it took me three and four-tenths hours. The standard is too easy; it is not a proper standard." My brother said to him, "You are acting as a leader for a number of men. You are carrying out other work for them, and you are checking it up, and that takes considerable time for which we have not been able to allow you, and that is the reason we allowed you more time on this particular operation, in order to compensate you for this extra time."

"Well," he said, "if that is the reason and you understand fully why you did it, and that it is a short time, I am willing to accept it, but not otherwise." That is the kind of a spirit, and the only spirit, on which one can build up proper relations in the shop.

We would have no objection whatever to submitting any changes of standards; just as we submit the original standards to the employer; we would also be perfectly willing to submit them to the employee; and we would be perfectly willing to have men from the employees who are qualified to pass on any changes of standard, feeling absolutely certain that substantial justice would be done. I would make a reservation of a veto on behalf of the employer, for the sole reason that I would fear that the standards set by the employer would be too severe. That has been our experience. Nobody ever feels any pity for any man or any person in his own position in life. He feels pity for people in other positions of life, but not for people in his own position. A man feels sorry for a woman or for a child or for an old man. A woman feels sorry for a child or for a man, but not for another woman. A man of my age may feel sorry for a woman or for a child or for a very old man. My father had no pity whatever for an old man he saw selling lead pencils on the street. I did feel sorry for him. I have no pity for a man of my own age who is down and out. He has no business to be. In the same way a workman who is an efficient worker has very little charity for the man who is inefficient and there is need there for a power of veto to prevent the standards from being too severe. That has been my experience.

As to wages I feel absolutely certain that the law of progress depends on the fact that value increases faster than cost and therefore the endeavor should always be to secure the highest paid man that it is possible to get; that what is coming is that there will be a rivalry and competition for the high-priced man rather than for the low-priced man. I would be perfectly willing in any plant to accept a wage rate of \$5 a day and make the costs lower in that plant than on any less sum than that that you could mention. I would beat out

the man and would feel confident that I would beat out the man who was paying \$4 a day or \$3 a day or \$2 a day.

Now of course there is a limit. I believe that the man should receive increasing wages for better conditions just as long as the unit price goes down, and no longer, because if you increase the wages when the unit price is going up, you are violating that other fundamental law, that with our increased power over the resources of the universe, costs are coming down. We are getting more than we formerly got. Therefore I give the worker increasing remuneration up to the point of increasing cost, and at that point I stop. I give the public a lower price, just as long as the volume of the product it buys enables me to make a lower cost, and no further. That is the way that I apportion the difference between cost and selling price.

One word more: I might say that we apply principles to the whole matter from the top of the organization down to the last detail. The principles of organization are very old. They were known in the days of Egypt, and they are not practiced in this country. They are unknown, or practically unknown. There is only one organization in the whole world that is standardized; that is, where you can take a man and change him from any one country over to another country, and he finds himself, and that is the organization of the navies of the world. Take a captain from a battleship and transfer him to a Turkish ship or a Chinese ship or a Japanese ship or an English ship, and he finds himself at once, and in no other line do you find any such thing as a standard organization. I have been in 200 industrial plants, and no two of them are alike in any respect. They get up beautiful little charts as to how they are organized, and there is the president on top—and I always put him at the bottom—what the functions of the general manager are, and the fundamentals of organization are absolutely neglected. They are not brought out at all. In fact, there are principles of organization, there are principles of employment, there are principles of adapting men to their work before they start out, and there are principles that apply to operation; and when we apply those principles we automatically eliminate inefficiencies. We simply automatically screen them out. I do not know but what I would like to submit, as a part of the record, an analysis of each member of this commission.

The CHAIRMAN. Surely.

Mr. EMERSON. I have seen only one or two of them before to-day, and I am perfectly willing to submit here as a part of the record an analysis of the qualities belonging to each member of the commission.

Commissioner WEINSTOCK. Some of us may not care to see ourselves as others see us.

Mr. EMERSON. One of the principles of correct management is not to offend.

Mr. THOMPSON. Is that all, Mr. Emerson?

Mr. EMERSON. Yes.

Mr. THOMPSON. I would like to ask you one or two questions. You stated, in your direct statement, that neither the employer nor the employee should have the right to settle the standard, but that that voice should be left to an expert. What objection, if any, is there to the employees taking part in the selection of such expert? Assume a case where a system was already in vogue, or a new case, whichever serves you the best.

Mr. EMERSON. I would have exactly the same objection to the employee selecting the expert that I would have to the employer selecting the expert. Generally neither of them is competent to do it. Unfortunately, as matters are now organized, the employer generally has a feeble chirp in the matter, and he goes out and he may make a wise selection or he may make a poor selection.

Mr. THOMPSON. This expert, as a matter of fact, serves practically as an umpire between the two, does he not?

Mr. EMERSON. He should, absolutely.

Mr. THOMPSON. Then would there be any objection, after such a system as you have established in a factory or a shop, to a collective bargain between the employer or employee that would permit them jointly to select some person of proper fitness—I mean an expert person—to act as mediator between them for the purpose of adjusting any changes—

Mr. EMERSON. It would be an exceedingly desirable thing, I should think, if that could be done. I would say that the opinion which the expert renders is not obligatory upon either the employer or employee.

Mr. THOMPSON. That is all I wanted to ask.

The CHAIRMAN. Mr. Garretson, do you desire to ask any questions?

Commissioner GARRETSON. Yes. Are you conducting philanthropic or a business enterprise, Mr. Emerson?

Mr. EMERSON. Sometimes I think I am conducting a philanthropic enterprise, but, nevertheless, I have been fairly successful in business.

Commissioner GARRETSON. It has a business end to it?

Mr. EMERSON. It has. It is an art, a profession, and a business.

Commissioner GARRETSON. I think you went a little further, if I understood you correctly, with the statement that Mr. Thompson referred to, that while the expert who was chosen would have the determining voice, it did not become, from your standpoint, applicable until it was accepted by both the employer and employee. Did I understand you correctly?

Mr. EMERSON. I would like to see that.

Commissioner GARRETSON. I think you went a little further, if I understood you, but I want to make it certain—is there anything—well, you repudiated the word "system" at one stage of the proceedings, but it is the best thing I know to describe the methods that you advocate—is there anything in the system which you advocate that is not in anywise reconcilable with a full practice of collective bargaining from your standpoint?

Mr. EMERSON. No; I know of nothing that would make it antagonistic to collective bargaining.

Commissioner GARRETSON. It may be carried forward, disposing in that manner of all questions of wage or conditions of service that were conformable to the standards you had set up?

Mr. EMERSON. My plan, yes, would be perfectly reconcilable.

Let me say, perhaps, that the wage methods that I think I have proved desirable were based on and modified from the methods of the Locomotive Brotherhood of Engineers; the different principles that they have advocated there and have used very largely in their contracts are those that I have studied and adopted as the basis of our method.

Now, as I said before, there is no obligation whatever on the employee to attain any standard that is set. There is, therefore, no injustice whatever done him in setting an abnormally high standard. Sometimes, when we wish to get work done in a hurry, where it is necessary to work very rapidly, we set standards that are unduly high; that we know are probably not attainable. We have guaranteed the day rate, the man gets just the same that he did before; he is under no obligation to work any faster than he sees fit, because there is no penalty imposed, unless he is so very derelict that he ought not to stay in any case—not able to do, say, more than two-thirds of a day's work; although in a plant where we employed 11,000 men, or 12,000 men, I never asked for the discharge of any employee or any foreman whatever. It was my pride to be able to bring up their efficiency without discharging anybody. So that, assuming that we should put in standards that were unreasonably high, we simply find that our men do not attain them; that there is not sufficient incentive, if they are too high. While it would be a very slipshod way of doing, and is not the way, by any means, that we usually pursue, we could successively lower those standards until we had found that they were working as a proper stimulus, and in that way be the guide to the method we would have to attain as a practical standard; but there would be absolutely no injustice to any worker in our setting a standard of 8 miles an hour, because as long as the man could earn his day's wages by walking 2½ miles an hour, it does not hurt him at all to have that imaginary standard set up.

Commissioner GARRETSON. Just one question further: In places where your methods have been put in vogue, I suppose after a time the personal connection of your establishment ceases with a place?

Mr. EMERSON. Yes.

Commissioner GARRETSON. Have you ever noticed that after your connection had ceased, there were, assuming for the moment that the 100 per cent man—I suppose 100 per cent represents the standard daily wage?

Mr. EMERSON. No. We pay 20 per cent more than the daily wage for 100 per cent.

Commissioner GARRETSON. Then 88 is—

Mr. EMERSON. Sixty-six.

Commissioner GARRETSON. If a man fails continuously to develop the capacity that is equivalent to whatever you establish as the daily wage, then have you seen that to act to eliminate that man from the service?

Mr. EMERSON. I would strongly advise eliminating from the service a man that does not attain 66 per cent of a reasonable standard, as he is not fit for

his job. When I say "eliminate him from the service," that same man may prove very admirable in some other place; but certainly a man that can not attain 66 per cent of a reasonable day's work is not fit in the place where he is.

Commissioner GARRETSON. All I wanted was to know what the practical working out of it had been in that direction; because the feeling of the men toward it, of course, would depend upon that practical result.

Mr. EMERSON. As a matter of fact, in certain places—not in this big plant of which I spoke, but in others—we have eliminated men, finally discharged them, who did not attain 33 per cent, but when a man was as high as 50 per cent we thought he was a good, promising prospect to bring up to 100 per cent.

Commissioner GARRETSON. That is all, Mr. Chairman.

Mr. EMERSON. Might I say one word more?

The CHAIRMAN. Could you not do it just as well after the members of the commission have finished asking you questions?

Mr. EMERSON. Certainly.

The CHAIRMAN. Very well; please do that.

Commissioner WEINSTOCK. Would you discriminate, Mr. Emerson, in the wage between the 80 per cent efficient man and the 100 per cent efficient man and the 120 per cent efficient man?

Mr. EMERSON. We believe in the classification of men. We believe that certain men ought to belong in class A, that might be 15 cents an hour, and other men in class B, 20 cents an hour, and other men in class C, 25 cents an hour; so that there are a number of different classes of men. And you might have a man that was 80 per cent efficient in any class.

Commissioner WEINSTOCK. Take the man in class A; you can subdivide those men so that one of them has proven to be 80 per cent efficient and another 100 per cent efficient, and the third 120 per cent efficient. Would you discriminate in the wage of these three men in the same class?

Mr. EMERSON. The men that are 80 per cent efficient receive the same bonus; those that are 100 per cent efficient receive more, and those that are 120 per cent receive still more.

Commissioner WEINSTOCK. You believe in the bonus system, then?

Mr. EMERSON. Absolutely.

Commissioner WEINSTOCK. You equalize the difference in efficiency by bonuses?

Mr. EMERSON. Yes. Let me say what that bonus system is. We believe in paying a man who is 100 per cent efficient 20 per cent bonus. If he attains any more than 100 per cent, which many of them do, a great many of them do, we give him all the time he saves at his full regular rate of pay, and we pay, in addition, 20 per cent for the time he works.

Commissioner WEINSTOCK. Where does the employer come in? Where do you get any benefit, if you give him all?

Mr. EMERSON. All the time he saves at his regular wages, and 20 per cent of the time he works.

Commissioner WEINSTOCK. I do not grasp that.

Commissioner GARRETSON. Let me ask a question right there that I think will bring it out. Under that system an employer would get exactly the same profit on this time that he did on the preceding time, would he not—or would he?

Mr. EMERSON. The profit to the employer, just as much as the profit to the worker, is enormous. The worker may increase his profit above his daily expenses as much as 800 or 900 per cent. So may the employer increase his profit very largely. The profit to the employer lies firstly in the fact that his overhead expense goes down tremendously, because if the overhead is 100 per cent, and this work is done in two-thirds of the time, he has reduced his overhead expenses one-third also; so that that would be one direct and very great gain to him in bringing down the cost per unit; and then he has more units to sell.

We regard the whole plant as a single machine, and we ask ourselves, how much can we get out of this big machine per hour? That is the thing that counts; and if you can get 100 pieces per hour, it is very much better than if you only can get 50. There is more all round.

Commissioner GARRETSON. And the bonus on the 110 comes in the employer's profit on the added 10?

Mr. EMERSON. That bonus comes in the added profit. The man's bonus comes in the fact that he is getting all the time that he saves at his regular rate—not

at his bonus rate, but at his regular rate, so that the cost per piece is going down all the time.

Commissioner WEINSTOCK. Do you believe in the time-watch system in determining how much time it should take to do a certain piece of work?

Mr. EMERSON. I believe in every instrument of precision you can use in determining the standard. It is the basis of everything, and there is no method that I would not believe in using—thermometer, barometer—we have used hygrometers and instruments to show in what direction the wind is coming, and everything else.

Commissioner WEINSTOCK. So that the stop watch is a part of your apparatus?

Mr. EMERSON. I have been willing at any time to use the stop watch, and with the full knowledge and consent of the men.

Commissioner WEINSTOCK. Do you agree with those representatives of labor who contend that the stop-watch system will not bring about a spirit of cooperation between the worker and the employer?

Mr. EMERSON. We never found it so, and we have worked with thousands of men.

Commissioner WEINSTOCK. You have found, then, that intelligent workers as a rule do not resent the stop-watch system?

Mr. EMERSON. Not when it is properly explained to them. Our object in using the stop watch and in making the time study is to find out what the troubles are that are preventing the poor workman from doing what he ought to do. Those troubles with the time are up to the management, and what he should do is to cooperate in finding where the loss is. Where he thinks that we want to speed him up naturally he objects, and I would not blame him; but where he once understands what we are trying to find out is why the work does not come forward, or why the power is shut off, or why he has poor tools, and things like that his spirit changes.

Commissioner WEINSTOCK. Representatives of organized labor have testified before this commission that they are in favor of giving the worker a higher wage for his increased effort, but that they are opposed to the employer giving him a bonus for increased effort. Do you think that that distinction is warranted on the part of organized labor?

Mr. EMERSON. It is not a distinction that lies in my mind. A bonus is merely a means of trying to grade wages as they ought to be graded. That is all it is. I would be perfectly willing to translate the bonus into a permanently higher wage; for instance, instead of giving a man 20 per cent bonus, if he was regularly 100 per cent efficient, I would see no reason at all for not giving him 20 per cent higher wage rate. It might work out just as well.

Commissioner WEINSTOCK. But would it? Because the worker might raise his efficiency until he got the bonus translated into wages, and, having once gotten it translated into wages, he would drop his efficiency.

Mr. EMERSON. Then I would drop his wages.

Commissioner WEINSTOCK. Then you would have a row on your hands.

Mr. EMERSON. Well, I do not know that I would.

Commissioner WEINSTOCK. The bonus on the one hand is adjustable?

Mr. EMERSON. Certainly.

Commissioner WEINSTOCK. Where the wage becomes as a rule fixed?

Mr. EMERSON. I would not allow that; I have the classification the man would pass from. I would always pass a man into a higher classification on account of length of service, irrespective of any efficiency whatever.

Commissioner WEINSTOCK. Contention has been made also that where the bonus or piecework system or premium system maintains, sooner or later the rate is cut when the output becomes, in the opinion of the employer, abnormally large; has that been your experience?

Mr. EMERSON. I issued a pamphlet at one time, 10,000 copies, to a number of workers, and immediately took up that point. I said "If you attain efficiency, what is to prevent the employer from cutting the rate? Nothing, except self-interest and common sense, because the moment he attempts to cut the rate you can retaliate, and I advise you to retaliate, and it will hurt him far more than it will you," and I have never had a case of the rate being lowered where we have put in our method.

Commissioner WEINSTOCK. It is further contended that any system of piecework or bonus offerings or premium offerings puts a premium upon slighting the work; that you get quantity at the expense of quality.

Mr. EMERSON. I have found that the character was not changed by the method of pay. We find that men that slight their work under the day system will also slight their work under the bonus system, and a man who is conscientious under the day system will remain conscientious under the bonus system. I never saw any connection between the character of the man and the method of pay, and, as a rule, seeing that you are employing better men, the quality almost universally rises.

Commissioner WEINSTOCK. Is it not true that all of us practically are more or less creatures of our environment and creatures of temptation, and when temptation is offered us and we are a little weak we fall when we otherwise would remain standing, and that this bonus or premium system is in the nature of temptation to the weaker man.

Mr. EMERSON. Liars will lie even if there is no excuse for them, and other men will tell the truth even though it is to their own harm. We found that we were able to build up such a spirit in the shop, and we did not find any difficulty in that way. I do not think that there is a difficulty. That is all I can say; practically it is not a difficulty, in my experience.

Commissioner COMMONS. I want to ask a question as to your method of computing the bonus. Could you tell us how actually you computed, for a blacksmith or a machinist, the making of the time study and the bonus?

Mr. EMERSON. You mean how we determine the standard?

Commissioner COMMONS. How you determine the standard, and how you determine the amount of bonus that shall go for that work; what units of time you take. If you could just go through the process by which you determine it, that is what I want to get at.

Mr. EMERSON. The bonus must be enough to attract, to act as an incentive on the man to do well. It must be enough for that purpose. Any bonus that is not sufficient for that purpose is too small a bonus. Any bonus that overshoots the mark and gives the man more than a reasonable incentive would be harmful, because it would put up to him the incentive of overwork, which we wish to avoid just as much as the inclination to underwork.

We have not found it convenient to pay the same bonus for a standard—20 per cent of what we call standard, but the standard can be varied to suit the conditions, so that we would have a harder standard in one line of work than we would in another, the standard would be much more easily attained in certain lines of more difficult work; therefore a man, if he works very hard, like a blacksmith, where he has to stand up in front of a hot fire and hammer very hard on the iron and keep his heats going along, he would be able to earn very much more—I mean he would be able to realize very much more than 100 per cent. Men of that kind might very easily realize 150, 160, and 180 per cent on which he would then receive a standard bonus of 20 per cent in addition.

Now, the bonus itself, as I have said, would pay the man 1 per cent; if it was 101, he would get 110; if it was 102, he would get 122; and if it was 110, he would get 130; and 120, he would get 140 per cent bonus, and so on. That makes it very easy to calculate. It happened by accident that it came out that way. The basis we took was this: We pay the man for all the time he saves above 20 per cent; 20 per cent because he did the standard work for the time he worked; that is our moral basis. The other is the computing basis, but they are the same; they work out just the same.

Commissioner COMMONS. Suppose you find, for example, that in a certain operation for a blacksmith that the time set, we will say, comes out one way—am I starting off on an illustration that you can follow? How much would you add to that for computing the standard of efficiency? Have you during the time studies actually brought it out to one hour? Do I understand there would be 20 per cent of that added?

Mr. EMERSON. No; oh, no.

Commissioner COMMONS. What do you add?

Mr. EMERSON. Oh, no. We might find that that blacksmith had only taken one hour to do that work, and we might give him a standard of two hours, if it was reasonable.

Commissioner COMMONS. That is, you would multiply it by two?

Mr. EMERSON. We might in that particular case.

Commissioner COMMONS. In that case how do you decide that? Is it based on multitude of experience?

Mr. EMERSON. Yes; absolutely.

In that particular case, if the work was very hard and the man had to have rest in between, and he could not reasonably do more than five pieces in a day, and anybody would know that five pieces was a reasonable work, even if he had done it in an hour, that would be no reason for making the standard one hour; we would set the standard at two hours.

Commissioner COMMONS. Even if he had done it in those two hours, he would get the ordinary time rate?

Mr. EMERSON. He would get two hours' wages.

Commissioner COMMONS. He would get two hours' wages?

Mr. EMERSON. And he would get 20 per cent on top of that.

Commissioner COMMONS. Twenty per cent in addition?

Mr. EMERSON. Yes; supposing he did it in one hour.

Commissioner COMMONS. That is getting it down one hour?

Mr. EMERSON. Supposing he had done that?

Commissioner COMMONS. Yes.

Mr. EMERSON. He would receive wages for that one hour and he would receive the hour that he had saved, full wages for the hour that he had saved; therefore he would receive two hours' wages, and he would receive 20 per cent for the hour that he had actually worked.

Commissioner COMMONS. He would get 220 per cent of the day rate, the ordinary rate for that hour?

Mr. EMERSON. Yes; that is what he would get.

Commissioner COMMONS. In the case of a machinist, you would not add another hour probably?

Mr. EMERSON. Probably not.

Commissioner COMMONS. You would add a half an hour?

Mr. EMERSON. It would depend a lot on what the situation was; that is absolutely a question. The determination of a schedule is the most difficult thing there is, because it must be absolutely fair, and all the knowledge you can possibly bring to bear on it, and all the experience is necessary in order to determine a fair schedule. Now, it is the fairness of the schedule that counts. We have taken men, taken a machinist, that has come to us, and we have said "Are you willing to work for \$3 a day?" "Yes; I am." "Very well, now that settles that point. Now, here is this work here. How long is it going to take you to do that work? How long will it take you yourself to do it?" He says "I don't know." "Well, let's try it," and he does it in 24 minutes. "Well," we say, "we will try it over again and see what you can do," and he does it in 18 minutes. Now we said to him, "We are going to give you a time of 30 minutes on that work. Can you turn out 20 a day, one every half hour in the day of 10 hours; can you do that? Would you be willing to do that, or do you think you can do it without undue fatigue," and he says, "Well, you saw me turn it out in 24 minutes, and you saw me turn it out in 18 minutes." "Yes; I know that, but can you turn one out every half an hour?" "Surely I could." "Very well, if you can do that we will pay you \$3.60 instead of \$3." Now, he is sure of his \$3 in any case, if he only turns out two, and if he comes to us at the end of a certain number of days and says, "I can't keep at that 20, it is too hard, I find I can't stand it," we would immediately reconsider it.

Commissioner COMMONS. Well, it is figured out then on each day's work, is it, or how is it computed, the bonus? Do you average it up for any period of time, or how do you conduct it?

Mr. EMERSON. We conduct it exactly as a deposit and checking system is conducted in a bank. We give the man credit for all the hours that he has delivered, and we charge him with all the money that we have paid him in the month. Now, if he has actually been present 250 hours and he has delivered 250 hours standard work his efficiency is 100. If, on the other hand, he has delivered only 200 hours standard work and he was present 250 hours and we have paid him for 250 hours his efficiency is only 80 per cent, and he would receive about 4 per cent bonus instead of receiving 20 per cent. If he delivers only 160 hours and had been present and received pay for 250 hours, his efficiency would only be 66 per cent and he would receive no bonus, but he would receive pay for his 160 hours.

Commissioner COMMONS. Do you usually figure it out on a monthly basis?

Mr. EMERSON. On the pay-roll basis. If it is a week, it is a weekly basis; if it is two weeks, it is two weeks; if it is a month, it is a monthly basis. We never apply it to the individual job, because we do not want a man to speed on an individual job. We want the average of his work.

I have one example of a man who has been working eight years. I know every job that he did during that time exactly at the standard time and the average time he has taken at each job in the eight years, and he has averaged consistently throughout that time 110 per cent. He was 53 years old when he started in. There is a man you might as well give an increased wage to as to give him a per cent.

Commissioner GARRETSON. Where is Dr. Osler?

Mr. EMERSON. I really do not know.

Commissioner BALLARD. I understand the tendency of this is to make the men speed up and perhaps have a desire to have increased output, and as the result of that perhaps to turn out some work which might not be as well done and which might, to the next man on further down the line, cause more delay than he gave good to the firm. Have you any evidence of that at all?

Mr. EMERSON. Yes. We had a man who was a riveter and a man who was a fitter. The man who fitted for the riveter was to receive a bonus on the amount of work he fitted. The poor riveter found that the work was so poorly fitted that he could not drive the rivets. So we suddenly turned around and paid the fitter the bonus on the work the riveter accomplished, and thus changed his whole viewpoint as to the fitting of the work, and after that we had no trouble whatever with poorly fitted work for the riveter.

Commissioner BALLARD. Is it possible the speeding up has indicated the men are unable to continuously perform? Does it appear to affect their health at all or have any suggestions ever been made to show whether the men, by this speeding up, were injured physically?

Mr. EMERSON. As I said, I gave you this example of this man 53 years old when he started in 8 or 10 years ago, and I saw him last year, and he was still on the same schedule of work, and very well.

I want to say my own impression is that everyone of us needs speeding up. The greatest wealth in the world is in our latent power, and most of us are tremendously inefficient, and we are tremendously lazy. I do not care what kind of a spur you put back of us, this is going to be a good thing. That is the way I regard humanity as a whole, myself included, and if there is any way we can inspire and encourage and stimulate people I regard it as one of the greatest possibilities that lies in the world to-day, because, as William James has pointed out, all of us have reserve powers that are undeveloped, and that make for the wealth of the world. Dr. Gulick has pointed out that the reason the white men are civilized and have beaten out the savages is because they have utilized their reserve powers to a greater degree than the savage ever thought of doing. You can take a team of white men anywhere in the world and put them up against a team of savages and they will beat them at doing anything, because the white race has had the greatest stimulant. That is my conviction. I want therefore to hold something up ahead of people. I am not driving them from behind; I am holding up ahead, and if it will encourage and stimulate them, not as the piece rate does, but stimulate them to become better types of men and women, that is the thing we need.

The CHAIRMAN. Mr. O'Connell, do you desire to ask the witness any questions?

Commissioner O'CONNELL. Have the hours of labor been reduced in any of the plants in which your plan or idea has been put into effect?

Mr. EMERSON. Yes; some of them.

Commissioner O'CONNELL. Have you them in mind, or would you desire to state them?

Mr. EMERSON. I would prefer to think that over, Mr. O'Connell, and give them.

Commissioner O'CONNELL. Have there any strikes occurred in any of the plants in which the system has been introduced?

Mr. EMERSON. After it has been introduced; no. While we were attempting to introduce it; yes.

Commissioner O'CONNELL. Would you care to give those?

Mr. EMERSON. The Rauch & Lang Co., of Cleveland, build electric automobiles. Just as we started in our work there was objection on the part of the men, and we discontinued the work.

Commissioner O'CONNELL. Where the system has been introduced in a plant has it ever been discontinued?

Mr. EMERSON. Yes; I think so.

Commissioner O'CONNELL. In many?

Mr. EMERSON. I do not know about many. Some of them have continued and some of them have discontinued. We have been thrown out from some plants with enthusiasm and we have left others with enthusiasm.

Commissioner O'CONNELL. You are interested in the introduction of the system in the Santa Fe Railroad shops?

Mr. EMERSON. Yes, sir.

Commissioner O'CONNELL. At Topeka, Kans.?

Mr. EMERSON. Yes, sir.

Commissioner O'CONNELL. Is the system still in operation there?

Mr. EMERSON. Yes, sir; not as I left it, but still substantially in operation.

Commissioner O'CONNELL. In the reduction of a force taking place where the system is in vogue, is there an indiscriminate laying off of men, or are the men of lower standard laid off?

Mr. EMERSON. We would always advocate the laying off of the men of least aptitude for the work. I would always advocate that.

Commissioner O'CONNELL. Regardless of the time of employment by the firm and the fact that they had given their life to the firm?

Mr. EMERSON. No; in case it was an old man with the firm long years we would consider there was very great moral obligation to take care of that man—very strong moral obligation, which we have always inculcated. Of course, what we much prefer is a clamor for increasing output rather than to go into a firm where the output is decreasing. That is one of the most painful things there is.

Commissioner O'CONNELL. Of course, we can not avoid sometimes slack times in business. There must be a stoppage of work some time, and some reduction. Then in the reinstatement of men after business picks up again, of those who have been laid off, I suppose those having the highest efficiency of the number laid off would be those to be reemployed first?

Mr. EMERSON. Those cases have not come up. I can state what I would like to do and what I advocate.

Suppose we are running on an average 9-hour day. Sometimes it might be necessary to go to 10 hours; other times it might be necessary to drop to 8 hours. I would like to see the balance of 9 hours maintained. Work still further slacks off, I would like to go to 7 hours or to 6 hours, or even to 5 hours, and then to 5 days a week, in order to preserve the force, because it seems to me the permanence of employment is one of the most vital things there is for the workingman. It is his bread and butter, and anything that throws a man out of employment is tremendously inefficient. It seems to me one of the worst features we have in modern industry, so that I would say to avoid that in any possible way.

Secondly, we have found through our long experience that men have been tyrannized over in the most outrageous manner by their foremen and by the employing owners, in a way that makes any decent man's blood boil. What we have tried to do is to make men independent of that possible tyranny on the part of the employer. We would never dream of allowing a foreman to discharge a 110 per cent man. He could not do it any more than he could take a sledge hammer and smash a valuable machine. That man is too valuable to allow any foreman whatever to discharge him. We might fire the foreman, or we might shift them so as to keep them employed, but as for discharging a man of that kind, never.

Commissioner O'CONNELL. That is all.

The CHAIRMAN. Prof. Commons wants to ask one more question.

Commissioner COMMONS. Mr. Emerson, you heard Mr. Tobin's testimony regarding the notion that piecework does not speed up more effectively than the bonus or premium system. I believe the bonus system you have would not add an inducement in the way of compensation as would the piecework system, would it?

Mr. EMERSON. As I have said, if there is anything we hate and despise, it is to go into a plant in which piece rates prevail. We consider it the greatest obstacle in the way of building up efficiency. What we find is that efficiency does not depend on speeding up. It depends on other qualities that are far more weighty in getting the output than the speed of the operator. In one place where they make bolts and nuts we found when they made 100 bolts it cost 38 times as much per bolt as when they ran a run of 10,000 bolts.

Those are the things that we come in to rectify. We find those confounded piece rates standing in our way nearly every time. We can not change around; we can not adjust; we can not make the shifts that would be possible to increase

the output, without increasing the work on the men under the piece-rate system. That is the reason we dislike it, and yet we have never seen the place where it was not possible to lower the cost as compared to piece rates, and yet make it easier for the men.

Commissioner COMMONS. You do not consider that pressure for overwork is as great under your system as it is under piecework—the pressure for speeding up?

Mr. EMERSON. In piece-rate work you have two things: You have the desire to speed up where the man is absolutely guaranteed his piece rate, and, on the other hand, you have the desire to stand pat for fear it will be cut. We find in a great many piece-rate establishments evidently the men are standing pat, and we do not blame them. If you see a man's wages \$12 one week and \$11.95 the next week and \$12.05 the third week, you may know right off he is standing pat, necessarily so. A great many employers look at the pay roll and shy at the idea of any man earning more than so much. In one foundry where we were the foreman went to a man and said, "Be moderate; be moderate here. Don't you dare to earn over \$3.50 a day. Every time you earn \$4.50 don't you know the manager comes down here and wants me to cut the piecework rates all around? Be moderate." We said, "What did you ultimately do?" He said, "I had to get rid of all the efficient men. I can not keep them in the shop. They could earn so much more money, but the other men could not keep up; therefore I simply had to get rid of those men." That is one of the evils we run into in this piece-rate business. We believe a schedule ought to be set to the material, the tool, the machine, and the man. If a man has been there for 20 years, he might have an entirely different schedule from the man that had just come in, with the same material, the same tool, and the same machine.

Commissioner COMMONS. Is there no possibility, under your system, of any pressure being brought to bear on the speedier man to reduce his output?

Mr. EMERSON. No; because there is no stopping point. There is no particular point at which they can stand pat. A man receives what we would call a nice piece of pie to-day, on some schedule that is rather easy; but he does not know but what to-morrow he will have a schedule rather difficult; and he goes right in and works at a regular efficient rate straight along. We have never found very much, of course, there are men that remain 80 per cent men—never better; and there are other men who are 120 per cent men right straight along. We find men striking a certain gait and they maintain that efficiency right along. Of course, I would prefer to shift the 80 per cent man over into something at which he would be 120 per cent efficient rather than keep him at something at which he is only 80 per cent efficient.

The CHAIRMAN. Mr. Garretson?

Commissioner GARRETSON. Mr. Emerson, do you believe that, in say the past 200 years, your adjustments have, in 100 per cent of the cases, been just to the workers; that the employer has always been fair and just to the employees?

Mr. EMERSON. No; I do not.

Commissioner GARRETSON. That is all.

The CHAIRMAN. Mr. Weinstock?

Commissioner WEINSTOCK. I take it, Mr. Emerson, that you believe it is wiser to give a certain number of men in dull time half a day's work rather than double that number a full day's work. In other words, suppose you had 100 men and business dropped down to one-half the volume, and you had to either discharge 50 people or put 100 men on half time; which of the two do you regard as the lesser evil?

Mr. EMERSON. I myself would much prefer to put 100 on half time.

Commissioner WEINSTOCK. Rather than reduce the number?

Mr. EMERSON. Absolutely. At the same time, there are a great many questions of shop discipline that I would be perfectly willing to refer to the employees themselves, and that would be one of them.

Commissioner WEINSTOCK. You would give them a voice?

Mr. EMERSON. If they preferred to go on to full time for half the number of men, I would consider it very seriously. My own instinct would be to employ the full number of men half the time.

Commissioner WEINSTOCK. You have expressed great objection to the piecework system. Do you think it is vicious in many respects? You heard, doubtless, what Mr. Tobin had to say about the shoe industry; that it was practically conducted on a piecework basis. Take the shoe industry as a unit, if you were given the power, how would you organize the shoemaking industry?

Mr. EMERSON. That, of course, might require one, two, or three months of careful study to make a report. We have been in shoe establishments, and we see no real reason why they should not be organized on standard time and a bonus, particularly the cutting department, of which Mr. Tobin spoke. We have worked in there along the lines he spoke of. The material counts for so much, and a cutter can waste so much that it is very expedient to pay him a bonus upon the material that he saves, or as he lessens the waste. But we hold our objection to the piece rates in the shoe industry just as we have in all the industries.

Commissioner WEINSTOCK. You think there is a better way that could be determined in the shoe business?

Mr. EMERSON. That is our conviction.

Commissioner WEINSTOCK. So you do not regard the present shoemaking system as the best conceivable?

Mr. EMERSON. Not by any means; not from what I know of the shoe business, and I have been in a whole lot of shoemaking plants.

Commissioner WEINSTOCK. Would you say that as an employer as well as a worker?

Mr. EMERSON. Certainly.

Commissioner WEINSTOCK. It is not the best possible for either party?

Mr. EMERSON. That is right.

Commissioner WEINSTOCK. That is all, Mr. Chairman.

The CHAIRMAN. Have you any questions, Prof. Barnett?

Mr. BARNETT. No, Mr. Chairman; but was not Mr. Emerson promised a chance to speak from his chart?

The CHAIRMAN. Yes. You may do that at this time, Mr. Emerson.

Mr. EMERSON. It will only take me a moment or two.

[Displaying a chart to the commission.] Here is the corner of 200 per cent efficiency, and down in this lower corner it would be zero. There are two ways of obtaining high efficiency. One is to travel along these lines in this direction [indicating], and the other is to travel up that way [indicating] so you are on a different line. We went into a shop in which the average efficiency was 80 per cent, in this way [indicating]. That line [indicating] shows 50 per cent. Without discharging any of the men whatever we were able to increase the average efficiency up to 100 per cent, as indicated there [indicating] by simply ameliorating the conditions that surrounded the men, dispatching the work, planning a schedule, standardizing the conditions, standardizing the operations, giving the proper standard of practices and instructions.

Here [indicating] is a man of 5 per cent raised to 10 per cent. That raised all the men in this way [indicating]. This man of 110 per cent got up to 220 per cent. There was a general raise all the way through. That is the part of the manager. On the other hand, every one of these men that was here at this point [indicating] originally started there at that point. They had to travel along this line up to this point [indicating]. That is the part of the worker. You have the high efficiency when you have the management giving the men a better opportunity, and you have the desire of the worker to travel along these lines [indicating] wherever they are, from that lower end up to this point [indicating]. It takes the combination, absolutely the combination of the manager and the worker, to move from that region down in there [indicating] up into this region up here [indicating]. I can only indorse what Mr. Taylor said, that it needs the cooperation of the worker and of the management in order to reach this region [indicating].

The CHAIRMAN. We are very much obliged, Mr. Emerson.

The commission will now adjourn until to-morrow morning at 10 o'clock.

(Whereupon, at 5:30 o'clock p. m., the commission adjourned until to-morrow, Tuesday, April 14, 1914, at 10 o'clock a. m.)

WASHINGTON, D. C., Tuesday, April 14, 1914.

The commission met at 10 o'clock a. m. in the assembly room of the Shoreham Hotel.

Present: Commissioners Frank P. Walsh (chairman), John R. Commons, Mrs. J. Borden Harriman, Frederic A. Delano, Harris Weinstock, S. Thruston Ballard, John B. Lennon, James O'Connell, and Austin B. Garretson.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. B. M.

Manly, superintendent Division of Industrial Relations; and Mr. F. H. Bird, superintendent Division of Public Agencies.

The CHAIRMAN. I would like to make this announcement, that Mr. Louis D. Brandeis, who was on the calendar for yesterday, can not be present until tomorrow; that Mr. Johnson, president of the International Association of Machinists, will be unable to be present on account of being at the national conference of his organization in St. Louis; and that P. J. Conlon, vice president, will take his place. Likewise, Mr. John P. Frey, of Cincinnati, editor of the Molders' Journal, can not be present, and Mr. L. P. Allifas has been subpoenaed in his place.

The first witness for to-day is Mr. Charles W. Mixter, of New Haven, Conn., who came over from yesterday's program, and I will ask Mr. Mixter to take the stand.

TESTIMONY OF MR. CHARLES W. MIXTER.

Mr. BARNETT. Mr. Mixter, will you please give your full name and address to the reporter, and your occupation?

Mr. MIXTER. Charles W. Mixter, 313 York Street, New Haven, Conn. My present occupation is time-study man with the Sentinel Automatic Gas Appliance Co., of New Haven. Do you care to hear about some things that led up to that?

Mr. BARNETT. I should like you to explain what your previous occupation was before becoming an expert in scientific management.

Mr. MIXTER. I do not claim to be an expert in scientific management yet. I went to Johns Hopkins University; graduated in 1892. I next went to Harvard Graduate School for two years. Then I went to Germany for one year, at Göttingen and Berlin, and then went to Harvard again for two years. I obtained my degree at that time. Then I was instructor for two years at Harvard, and also instructor at Trinity College, Hartford, for one year. Then my health broke down and I went to Central America for nearly one year to get well.

Coming back, I was instructor at Harvard for two years. Then I was professor at the University of Vermont for 10 years; that is, 9 years teaching, and the last year on leave of absence.

I may say that early in my residence in Burlington, Vt., my chief acquaintance on the faculty happened to be the mechanical engineer. He knew about Mr. Taylor's views, having heard the papers when they first came out, at meetings of the Society of American Mechanical Engineers, and having heard Mr. Gantt's papers. That was a common meeting ground for us to talk about. I did not know much about his subject, and he did not know much about mine, so I became interested in scientific management, and presently began to teach it to my engineer students, having a section of engineer students, separate from the others; if I may say so, I think I was about the first one in the United States to teach scientific management.

Mr. BARNETT. What were you teaching at that time?

Mr. MIXTER. My subject was economics, and for the engineer students I gave them a course in scientific management.

Commissioner WEINSTOCK. What university was that?

Mr. MIXTER. The University of Vermont. That was 6 or 7 years ago that I began to teach the subject, and as time went on I became more and more dissatisfied with having only book knowledge of the thing, so I obtained leave of absence and went to the Tabor Manufacturing Co. a year ago last August. I stayed there just a year. I first went into the stores room, in the tool room, and then was assistant to the stockkeeper, on the assembling floor. I got rather tired of that sort of thing, and asked for a real job. They gave me a real job at bench work, and I may say I kept regular hours and was on the pay roll. After a while I helped the clerk in the planning room for about six weeks, and then went back in the shop, again on the bench work. I did some machine work, but mostly bench work.

Then I assisted the inspector a good deal, a job I never liked, measuring and counting things. I would a good deal rather make things.

After I got through with them, I had a little more bench work, then finally went in the planning room. I did not go around to all of the positions in the plans room, but quite a good many of them, and finally all last summer was on one job helping the foundry clerk.

Then I left there when my year was up, and when I got home I investigated one plant, wholly innocent of modern methods, a place where I did not have any

real job—I was not hired to do anything, but was allowed to go in there and make a report on how they might improve things.

Then I went to the Acme Wire Co., of New Haven, Conn., in December, and there served a sort of apprenticeship in time study, and now have been transferred to this other firm, controlled by the same proprietors. They are not ready yet for time study to be made. It is a new concern, just starting with a new product, and I am helping install, and doing all kinds of jobs. I realize I have got a great deal to learn, and I do not profess to be an expert.

Mr. BARNETT. In those systems of scientific management which you have seen in operation, will you explain what the system of remuneration is?

Mr. MIXTER. The task and bonus system.

Mr. BARNETT. In all you have seen?

Mr. MIXTER. Yes.

Mr. BARNETT. Is the method of making time studies identical in the establishments you worked in?

Mr. MIXTER. Practically so. I did not have much to do with the time-study department at Tabor, so I would not be able to talk about details there, but, so far as I know, substantially the same.

Mr. BARNETT. Will you give the commission your view as to whether in the places where you have seen the system installed, the task and bonus system seems to induce overexertion on the part of the employees.

Mr. MIXTER. Only occasionally by accident. Sometimes on particular work the time is set short by accident. I may say that the error is almost always the other way; that the times are set too long, and there are reasons for that; but occasionally the time is set short, and the workmen, out of pride, without saying anything, without making any kick, do press themselves a bit to get through in time, but they can kick if they want to, and at the Acme they do kick, and the foremen kick for them all of the time.

Commissioner WEINSTOCK. Against the system?

Mr. MIXTER. Against any time which, through the natural error, the time-study man himself occasionally has set too short.

Commissioner WEINSTOCK. They simply kick against the time as set too short and not against the system?

Mr. MIXTER. Oh, my, no; not against the system, but the actual job as it happens to go through the shop. The foremen are paid bonuses on the number of made jobs, and just as soon as the operative thinks the job is not coming made, instantly they report to the instructor. They have instructors in each of the rooms besides the foreman, and the instructor commonly is able to show what is wrong and pull the matter up all right, but if they should not prove so, and if batch after batch should say the material did not come right, or something, the foreman goes right down to the time-study desk and the time is revised.

Mr. BARNETT. Can you give us any idea as to what part of the men or women at work on a task ordinarily make more than the task—that is, complete the job within less than the time? In other words, is it the expected thing that the average will be just about the task, or that a considerable part of them do more than the task?

Mr. MIXTER. Now, that depends a good deal on the character of the work as to whether it is repetition work or jobs that vary. On the jobs that vary, and where, say, only one workman does that kind of work, as a rule it is more difficult to get a good time than where there are many work people engaged in that same kind of work, and there the most of the times are right, but some of them vary, being too long, and some a little too short. The average most decidedly is in favor of the workman; but the time cards men are short, because on the jobs that are too easy they hold back, use up nearly all the time, and hand in their tickets just as the time set is up. So you could not tell by looking at the time ticket, but on a job that is repetition work, as at Acme, and especially in the assembly room, a very large proportion of the girls beat the time a good deal. They get through a batch, say the time is a day and a half—of course, it varies for different sizes and types, but on the whole about a day and a half—there are a very large proportion of the girls, I would not say just what per cent, but I think one-fifth or one-quarter, who get through in just a little over a day. They beat the time two or three hours. Then they take a rest, and no foreman or instructor hustles them and says, "Hadn't you better get together and on another batch?" After they have rested until further rest time is more of a bore than a value, they will start in of their own accord on a new batch.

Mr. BARNETT. Do the weekly wages of these people come to more than the task time would indicate? That is, do they earn more wages than the allotment to the task would give them?

Mr. MIXTER. If I understand what you mean, my answer is, "Yes." The bonus is multiplied by jobs per day; that is, the rate at which they are working. So if they beat the time a good deal their wages mount up very rapidly.

Mr. BARNETT. So that they do exceed the task?

Mr. MIXTER. They have a motive to exceed the task. They are not required to, but those who can easily work well inside the time, of their own accord and from ambition, after they have rested all they want to, will start in again on another job, on another batch.

Mr. BARNETT. And you say those are about 20 per cent?

Mr. MIXTER. I think about 20 per cent.

Mr. BARNETT. Have you any opinion as to whether the variability of efficiency—that is, of speed—is greater under a system under which the task and bonus system is not used, than under a system in which it is used; that is, between the ordinary wage system and the task and bonus system? How does the variability compare?

Mr. MIXTER. I think I see what you mean. You mean compared to the point of view of piece rates?

Mr. BARNETT. Yes.

Mr. MIXTER. I happened to get to talking with a man on the train coming down here, a man who worked in the New Haven shops at New Haven, the kind of man on whose word you can depend. You can depend on what he says. I think I know now how I can pick out a workman who does not draw the long bow, but just talks facts—and he told me about his experience under the piece rate, not in his present employment, but in a former shop that he worked in. He said a man's mind is never at rest. He is always worrying about whether the next job he will get will be profitable or not. Whether a different kind of a job or the same job—because the same job varies according to whether work comes right or not—whenever a piece-rate worker gets a bad job, and the times are set by perfect guesswork, ragged and all out of line ordinarily, for piecework in the old-style shops, a man can not make wages, as the saying is. He works his head off and has nothing to show for it. On the other hand, whenever he gets the other kind of a job at a piece rate, it hurts his self-respect to hold back on it and not make as much as he might, because he knows the rate will be cut if he does.

To my mind, also, there is the steady flow of piecework, say in a shoe factory. Under the bonus system the end of a batch is a sort of stopping place. It breaks the unbroken flow of the thing, and I should say that there is simply no comparison between working under the task and bonus system and the piece-rate system.

Mr. BARNETT. Let us see if we can reduce that to some definite arithmetical proportions. Let us suppose that there were a hundred men at work under a system of piece rates, and out of that hundred men a certain part would cluster around an average, somewhere around a medium. Then some of them would be at some distance from that, some above and some below that. Now, under a task and bonus system, would they tend to cluster more closely around this average, or would they be more dispersed? In other words, does the task and bonus system tend to produce a standardization of the work of the people, in your opinion, and are there less differences in the output of the different people under a task and bonus system than there would be under a piece system, or under a daytime system?

Mr. MIXTER. I doubt very much whether a correct answer could be made to that question as regards the system. It depends upon the application of it in the particular shop. If the bonus time is set rigorously, then there would be a tendency to bunch the workers at the bonus point. They would not be spread out so much. But where the bonus time is set liberally, as it is at Acme, the foremen and the instructors in the interest of their own bonuses, see to it that the time is set rather liberally. Then from that point the workers spread themselves out according to their natural differences.

Mr. BARNETT. But a severe task would tend to produce this standardization of output, in your opinion?

Mr. MIXTER. Yes. Then there would be the matter of selection come in. After a while you would get a picked body.

Mr. BARNETT. You do not know whether any statistical studies have been made as to the differences between the effects of these different systems on the standardization of the employees at all?

Mr. MIXTER. No, sir; I do not know anything about that.

Mr. BARNETT. If I understand you, at Tabor the foreman is paid according to the number of persons who come up to the task? That is, his bonus depends on the proportion of the workers who reach the task?

Mr. MIXTER. It is slightly different in form at Tabor than at Acme. At Tabor the foreman's bonus is based on the percentage of the bonus earnings of the men under him, while at Acme it is simply on the proportion of made jobs.

Mr. BARNETT. How do you men—the proportion of made jobs?

Mr. MIXTER. In a certain department, if all the workers make a bonus, then it is 100 per cent made jobs. If they do fall down, then it is, say, 95 per cent made jobs, and there is a scale of foremen's bonuses, running from 30 per cent downward, depending upon that proportion.

Mr. BARNETT. So that, according to your experience, that induces the foremen to complain if the task is too high, because the foreman then can not get much bonus?

Mr. MIXTER. Yes.

Mr. BARNETT. Suppose a foreman was paid according to the total output? Would he have the same incentive to complain about the severity of the task?

Mr. MIXTER. No; that would concentrate his attention in another way and make a driver of him.

Mr. BARNETT. Have you seen any shops in which that system of remuneration of foremen was in vogue?

Mr. MIXTER. I have heard of them, but never worked in such a place.

Mr. BARNETT. Is it a principle of the Taylor-Gantt system, which you have seen, that the foreman shall be rewarded according to the number of workmen who make their task?

Mr. MIXTER. Yes.

Mr. BARNETT. That is a part of the system, is it?

Mr. MIXTER. Yes.

Mr. BARNETT. Is that intended in part to prevent speeding up or driving on the part of the foremen?

Mr. MIXTER. Not so much that as to achieve maintenance of schedule and to make it for the interest of everybody to smooth out the rough places. The great trouble in a shop is in work not coming right, material falling below standard; and where the workers make bonus, and then the foreman has bonuses based on that; then he kicks right straight off when things do not come right, and it is intelligent kicking that goes to the right place to settle it, and not a mere kick that sets people to swearing, the usual way of trying to hustle things up in the old-style shop.

Mr. BARNETT. You are acquainted with the theories of collective bargaining and the history of collective bargaining in different industries of this country and abroad. Does it seem to you possible to introduce into the efficiency systems some form of collective bargaining by which the workers collectively would have a voice in the fixing of the tasks?

Mr. MIXTER. There is nothing essentially incompatible, but a very great practical difficulty, especially at the outset—the reorganizing of any old concern. The installer has his hands full, struggling with the management, just as Mr. Taylor and others said yesterday. He has to go around sometimes and fight battles to get the bonuses for the work people, and so on; shaking his fist under the nose of some old fellow who has control of the business in the head office, and a great deal of his time and energy goes that way.

Then, all along down the line, the superintendents and room bosses, and so on, are naturally wedded to their ways of doing things, and it is human for them to rather resent this outsider coming in to show them how to do their business. They are all the time raising objections, and he has to spend a great deal of his time talking and arguing and persuading people into the new view—the new way of doing things. Now, if in addition to that a workman should come to him and say, "We want to be persuaded, too, about all these times, and so on, that you have set," and he would say, "Jim, I simply can not do it; my cup is full; I can not do it," and it would be largely wasted time. He would be objecting to things in advance, in anticipation. You would say, "Try it first; I tell you I am going to give you a square deal; try it first."

Well, it is that exigency that would stand in the way at the outset. Then, after a while, what happens is this, that the high pay and better conditions make the work people fall away.

Mr. BARNETT. Do you mean it makes them fall away from the unions?

Mr. MIXTER. Yes; fall away from the unions; and so you do not get it in the end for that reason; not because of hostility to the unions, but simply because it dies out of itself. And I might say at that point the scientific-management man and the leader of organized labor are a good deal like rival tradesmen trying to sell the same thing to the same people—that is, higher wages and shorter hours. That does not come as fast as it ought to, for a reason I will give presently—that is, give my surmise. The organized labor man believes in organized labor on principle, and he wants to have these institutions go on doing business at the old stand. Here comes along a rival tradesman who takes away their trade; they not only have a personal interest, but they think in the long run it will not pay labor to fall away. In a certain concern in England—I had occasion to review a book last year describing their methods. There, when the high wages and better conditions generally caused people to fall away from the unions, the employers regret it and they try to induce the men to stay in the unions. I think American employers are apt to take a shortsighted view about that, and to think it is a nice thing to have the workmen fall away from the unions. They do not seem to realize that they have got to come to recognize the great principles of democracy at last, and they might just as well begin to do it now. It is not a good thing in the long run for labor to fall away from the unions.

Mr. BARNETT. How do you consider that the system of collective bargaining for the setting of these tasks, for example, might be worked out, assuming that the men did remain in the union, that the unions were strong, and that they desired, after the system had been installed—passing over that initial difficulty—that this thing be done? Have you thought about how collective bargaining might operate on the task system?

Mr. MIXTER. Nothing very much in particular, except it would be like in collective bargaining if we had had the times and the bonuses, the base rates, the wages and hours, like the subject of debate on terms of conditions and agreements. I do not see any reason why it might not be.

Mr. BARNETT. I mean about setting the task; it would be necessary, would it not, if the subject of task setting was to be brought under any efficient joint control, for the union to have a representative with the efficiency engineer?

Mr. MIXTER. Perhaps not exactly that way. My opinion of the way that capital and labor must get along in the future is something of the way as happened pretty generally throughout the old countries of Europe. They still have permanent heads of the Government, the Crown, and a good deal of the ancient Crown prerogative is retained, but checked, controlled by the elective Parliament, it seems to me, in something the same way we have to work it out in industry. The prerogatives of management, of course, have got to be retained. Every ship that sails the sea has got to have a captain. Somebody has to be the boss everywhere. You can not have too many cooks in the executive work, but there might be a parliament, if you please, some body of representative men of the employees who would have full check and control, or sufficient check and control on the exercise of the prerogatives of the management, in their representatives, of course.

Mr. BARNETT. To bring that down to a concrete case, suppose that in a shop in which the right of the employees to have a voice in the setting of their tasks was admitted, a particular task was set and it was not changed by the foreman on complaint of the employees, how do you think that matter might be adjusted under a system of collective bargaining?

Mr. MIXTER. I do not think these head-on collisions come very often, just as Mr. Taylor said yesterday.

Mr. BARNETT. But suppose one did come?

Mr. MIXTER. In the last resort there is only one answer to make: The prerogatives of the management, of course, have the final say now, at any rate.

Mr. BARNETT. They do now.

Mr. MIXTER. Under collective bargaining you could conceive that both sides would have an equal say.

Mr. BARNETT. What I am trying to get at is how do you feel the employees could fit into this system? Would it be an advisable thing for the employees to have—as, for example, in the mines the miners have a check weighman, who stands by the side of the operator's weighman and ascertains whether or not the weighing is correctly done—a check efficiency man? Would it be possible for the operatives in a large establishment to have by the side of the efficiency man of the establishment a representative of their own, who saw these time studies and who had in mind the interests of the employees, who was especially charged

with that, and then in case they disagreed perhaps the matter might be referred to a third person?

Mr. MIXTER. Wherever necessary. I do not see why there should not be a representative of the employees who might perhaps be a specialist on time study, and the time study man explain to him fully his methods, and so be able to adjust these things for them when they came up. That there should be a representative of the men chasing around the shop all the time with the time study man, at his elbow, working his watch also like the other man, which indicates a suspicion of cheating all the time, I do not think is necessary.

Mr. BARNETT. Do you think the presence of a timekeeper representing the employees indicates suspicion necessarily?

Mr. MIXTER. I imagine that, because there have been some mighty bad practices in the past on the part of employers and employees both, perhaps.

Mr. BARNETT. Suppose in a certain industrial line it should be found these tasks were consistently too heavy and the employees found them constantly too heavy, would that not form the same kind of justification for the establishment of a check efficiency engineer?

Mr. MIXTER. If those conditions obtain, it would call for correction, and correction through the forces of organized labor and their representatives. It could not be obtained otherwise. I do not think there would be any necessity of their having a representative man at the elbow of the time study man all the time. I do not agree to that at all. If he is worthy of his job at all, he is going to do it in a professional spirit. As far as I know, the errors that are taking place are through ignorance. There are a number of young fellows who sometimes make mistakes, but the final mischief is done in the head office. It is not the time study man that sets the tasks too high. It is the policy of the labor-grinding proprietor. Your organized labor might go directly for them. They need not make a burden on the time study man. I know of a certain place, or, at least, heard of it, where the operators had been around smashing the time study man's windows. It was not his windows they should have been breaking.

Mr. BARNETT. Would it not be a protection to the time study man in seeing that his rights were not interfered with by the firm if they were made under joint consideration with the representatives of the employees, assuming that that representative was a fair-minded man and that he was intelligent enough to understand the methods which were in vogue? In other words, would it not insure the efficiency expert against interference by the firm in his work?

Mr. MIXTER. I do not know whether the very best control would come that way. As regards the unfair attitude which the employee may take toward the installer or the time study man, it depends on the others' perfection or their opinion and public opinion generally. So far as the detail in the shop is concerned, the usual methods of organized labor might apply.

Mr. BARNETT. What would be your objection to this check efficiency man—the cost of it or the difficulty of agreeing with the men, the possible difficulty of agreeing with the men? What would be your objection to it, concretely?

Mr. MIXTER. A sort of mixing of legislative control with administrative work. You can not explain the details of everything as you go along. You can not ever get the work done. The demonstrator has to go ahead and do things, and then, say, a representative body have a check on his work after it is done.

Mr. BARNETT. So you would feel that the check on the control of the efficiency man through collective bargaining ought to come after his work is done?

Mr. MIXTER. Yes.

Mr. BARNETT. That is, that the complaints would be made by the particular operatives concerned to their union, and through them would be taken up?

Mr. MIXTER. Yes; after his work is done and after it is tried out, about right off.

Mr. BARNETT. That is all.

The CHAIRMAN. Have you any questions, Mr. Garretson?

Commissioner GARRETSON. Yes; I have one or two that I want to ask.

Take your attitude as stated, Mr. Mixter, on the question of the right of the employer, that it can not be interfered with; is not that exactly the attitude that has been taken by every employer since the beginning of time until he had some of his opinions changed by organized labor?

Mr. MIXTER. I think there have been other forces at work besides organized labor.

Commissioner GARRETSON. Whatever has changed it, the prerogative is what has always been insisted upon—benevolent despotism.

Mr. MIXTER. Oftentimes the benevolent part is left out.

Commissioner GARRETSON. The new plan would be benevolent despotism. In other words, I have noticed running through your ideas of efficiency, of scientific management, the broad idea that a new boon was being brought to men, and that they were not entitled to any voice in fixing its terms. They must take just what was brought to them, without having any voice in fixing its conditions. Is that any more than a repeating of the old attitude of the employer all of these years, except with this difference, any man that is connected with an efficiency system—and in that term I am embracing all of the various systems—seems to assume that its administrators possess qualities that the employer has not possessed heretofore? Is not that the idea?

Mr. MIXTER. I think that is the idea, and I think it is so, too.

Commissioner GARRETSON. Good. That is a scientific fact—that it is so.

Mr. MIXTER. I think that this movement has really brought something new into the industrial world.

Commissioner GARRETSON. That is not the question that I asked. The question I asked was in regard to the personnel of the men who present the movement. Are they more superhuman than has been in the game before?

Mr. MIXTER. They do have a different spirit and different methods.

Commissioner GARRETSON. When they go into the temple to pray, they say, "We thank the gods that we are not as other men"?

Mr. MIXTER. No; they do not say anything of that sort. They do not profess to be more virtuous than other men, or to be so much wiser than other men, but there are such things as inventions in the world of ideas, as in other realms, and new movements, new ideas.

Commissioner GARRETSON. Did not your theories of absolutism in administration reach their highest side in slavery?

Mr. MIXTER. I have no theory of absolutism.

Commissioner GARRETSON. Declarations made in regard to the nonright of the worker to a voice in these matters, and that the men who are putting efficiency systems in could not give heed to their protests because his cup was full. It struck me that that vein runs through it.

Mr. MIXTER. I maintain that is not a declaration of absolutism, it is simply a statement of fact.

Commissioner GARRETSON. In other words, the system and the employer have all of the rights that have always been claimed for him, and the worker gains no rights, he must accept the good that comes to him without any voice in how it is to be arranged?

Mr. MIXTER. Until the entrepreneur changes, either under this system or any, of course; but I would like to make this statement: It is true the system introduces checks and balances which considerably modify the old autocracy. It is true that you get, to a very great extent, a government of laws and not of men—to a considerable degree.

Commissioner GARRETSON. You are reasonably familiar with the average man's ideas of some laws?

Mr. MIXTER. I do not understand exactly what you mean.

Commissioner GARRETSON. The average man does not hail all laws as good.

Mr. MIXTER. No; they find some of them very irksome.

Commissioner WEINSTOCK. Do you favor the piecework system, Mr. Mixer?

Mr. MIXTER. Not at all.

Commissioner WEINSTOCK. What are your objections to it?

Mr. MIXTER. It is a hit-or-miss-it thing, a crude device. It could conceivably be worked fairly well with time studies, but even then it would be much more difficult to set piecework right with time studies than the task and bonus. If you make any error one way or the other, the thing tips too much over against the man or against the company.

Commissioner WEINSTOCK. In other words, you think it unscientific?

Mr. MIXTER. Essentially so.

Commissioner WEINSTOCK. Do you favor the task and bonus system?

Mr. MIXTER. I do.

Commissioner WEINSTOCK. Where do the two differentiate?

Mr. MIXTER. Well, on the task and bonus system, on jobs where the work does not come right, and that means not only difficult jobs, but simple jobs, from time to time, does not go against the man. The utmost they can lose is to lose their bonus, under the bonus system, for they get their day wage anyway.

Commissioner WEINSTOCK. They are sure of a living?

Mr. MIXTER. They are sure to get their base day wage, anyway. Then there is the advantage for the firm, too. If it tips the other way, there is not the incentive to cut. In piece rates, when they get out of line and the earnings are extravagant, the rate is cut, while under the bonus system, while the pay may be handsome, it never runs away out of sight.

Commissioner WEINSTOCK. Do you favor, under the task and bonus system, giving labor a voice in fixing the rates?

Mr. MIXTER. Those are separate things, in a way. The whole matter of collective bargaining stands on its own footing, and as an economist, I believe in it.

Commissioner WEINSTOCK. If you owned a plant and you introduced the task and bonus system in your plant, would you be willing to give your workers a voice, an equal voice with yourself, in determining the proper rate of bonus?

Mr. MIXTER. I should certainly want to, but if I found things were getting all mixed up, and I could not make it that way, I would be human enough to give it up.

Commissioner WEINSTOCK. You mean if you found yourself and the representative of labor were continually disagreeing, and it was causing delay and friction, you would give it up?

Mr. MIXTER. Delay and friction—too many cooks.

Commissioner WEINSTOCK. Could not that be overcome by a third party who would be an arbitrator in disputed cases?

Mr. MIXTER. I do not believe in arbitration at all with outside people. The way to settle disputes is inside the industry.

Commissioner WEINSTOCK. The thing that would make you hesitate to give your labor an equal voice with yours in determining the bonus would be the fear that you would disagree, and that disagreeing, you would have no means of settlement, other than by an arbitrator whom you would look upon as an intruder?

Mr. MIXTER. If I saw the arbitrator coming I would agree right off in no time. I would much rather come to any sort of an agreement.

Commissioner WEINSTOCK. You think that yielding to labor would be a lesser evil?

Mr. MIXTER. Decidedly, in the long run. In the long run it could be worked out so that there would be no evil at all.

Commissioner WEINSTOCK. Your objection to giving labor a voice in fixing the bonus is the fear of a disagreement and an objection to having an arbitrator?

Mr. MIXTER. It is a sort of practical and temporary difficulty. Say, where you are making an installation, you would have so many things objected to before they were tried. I am sort of speaking all of the time of two sides of minds, one side the economist side, and the other side that which goes to the practical difficulties, especially where you are making an installation.

Commissioner WEINSTOCK. It would be in the nature of a hamper and a hindrance?

Mr. MIXTER. Yes; and sometimes that is so great that you have to let your principles go for a while and say "Let us get on."

Commissioner WEINSTOCK. You favor collective bargaining?

Mr. MIXTER. Certainly, on principle.

Commissioner WEINSTOCK. What opportunity is there for collective bargaining in a bonus system if labor is not to have a voice?

Mr. MIXTER. I hope we shall all come to that, that they will have a voice. I believe in it.

Commissioner WEINSTOCK. On the one hand I understood it is impracticable to give labor a voice, and the other—

Mr. MIXTER. Impracticable while the system is being installed.

Commissioner WEINSTOCK. In which side of it is it practicable to give them a voice?

Mr. MIXTER. Usually after the system is thoroughly installed. There are quite a good many things that I think might be done, say, after any shop has had scientific management for five years. I believe there are a good many things about the system itself that can be sloughed off, that were necessary in the earlier stages, and take collective bargaining; the proprietors might well say that we could not do it then, but we are ready to do it now.

Commissioner WEINSTOCK. Then you would suspend collective bargaining in the early stages of the game?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. And you would take it up at some future time when the machinery was running smoothly?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. What occasion would there then be for collective bargaining after the machinery was running smoothly?

Mr. MIXTER. On general principles—

Commissioner WEINSTOCK. What would there be left to bargain about?

Mr. MIXTER. A further reduction of hours, for one thing.

Commissioner WEINSTOCK. Questions other than prices?

Mr. MIXTER. The fundamental base rate of wages, of course, and some other things.

Commissioner WEINSTOCK. Then the only thing upon which you would not want to have collective bargaining in the early history of the proposition would be the bonus maintained, and you would not object to collective bargaining on the base wage or on the question of hours and working conditions?

Mr. MIXTER. "Working conditions" is a pretty broad term.

Commissioner WEINSTOCK. I mean the physical conditions of the shop.

Mr. MIXTER. Oh, there is no reason why they should not be made right.

Commissioner WEINSTOCK. You would simply draw the line in the beginning at collective bargaining, so far as it would relate to the bonus or the premium?

Mr. MIXTER. To the task and bonus.

Commissioner WEINSTOCK. In that you would want to be supreme for a time?

Mr. MIXTER. Largely, in the matter of putting it in and giving it a good trial. Then let the objections come after the trial.

Commissioner WEINSTOCK. In the State of California, where I live, at the last session of the legislature a measure was introduced for establishing, through a properly appointed bureau, a minimum wage for women and minors. To the surprise of the public generally, organized labor fought it very bitterly. The alleged reason given on the part of organized labor for fighting the minimum wage was that they believed, if enacted, the minimum wage would become the maximum wage, and therefore would not be in the interest of women and minors. That was the alleged reason. The real reason, as was later developed, was that organized labor feared that if the State were to fix the hours of labor, as the State has done in California, for women and minors, and if the State also was to fix the minimum wage, that there would be no reason for women and minors joining unions; that the answer would be that "the State is doing for us all that unions can do, and hence there is no occasion for us to pay our dues and to burden ourselves with that tax." From what you know of conditions you realize that organized labor opposes the bonus system and the premium system on the ground that it injures the worker physically; that it leads him to become a strenuous worker rather than simply an industrious worker. Do you believe that is the real reason on the part of organized labor, or is it not the fear that the success of the bonus system will make the men drop out of the unions?

Mr. MIXTER. I think that is the alleged reason and not the real reason. Of course, I have a great deal of sympathy with that attitude. Of course, they do not want to see their position undermined at all, and, of course, it has given deep offense—all this about the planning room being the brains of the shop. There is plenty of room for brains in other places than in the planning room. In various ways the hair has been rubbed the wrong way, and therefore naturally, just the same as all of us do, they put forth the most telling arguments, the arguments that will go best with the public; and hence the claim in respect to the degradation of being timed with a stop watch. I would like to talk about that also.

Then there is this claim of alleged overspeeding, which was made before a committee of the House of Representatives the year before last. Somebody said that under the symbol system in a Taylorized shop the men were forgetting the name of a hammer. Nobody but the instruction-card man, the tool-room man, has any occasion ever to use the symbol for a hammer. All sorts of things are brought forward that are calculated to catch the sympathy of the public as objections to the system. The real reason is that the position of organized labor is undermined, and, as I say, I have a good deal of sympathy with them.

Commissioner WEINSTOCK. I take it that you are not an employer.

Mr. MIXTER. No.

Commissioner WEINSTOCK. And your sympathies are with labor rather than with the employer?

Mr. MIXTER. Naturally, from being a professor of economy all of my life, my sympathies are that way, and yet, again, I am a man of science, so I do not let

my sympathies go either way; but I am getting more and more the employer's point of view, naturally. I could not help it. I see his difficulties; and on time study I am going to try and set the times so that they will be fair to the workpeople, and of course I am going to do it also within the idea of setting them so that the company would not lose money.

Commissioner WEINSTOCK. You have no prejudice against organized labor?

Mr. MIXTER. None. My sympathies, rather, are with it.

Commissioner WEINSTOCK. I gathered from what you said that you think it would be a calamity to society for organized labor to be wiped out?

Mr. MIXTER. Yes. It makes serious mistakes, of course, and all of that; but I think it is part of the great democratic movement of the time, and we have to accept it.

Commissioner WEINSTOCK. Therefore, talking as you do, you do not talk as a man hostile to organized labor?

Mr. MIXTER. Not at all.

Commissioner WEINSTOCK. But one whose sympathies are with organized labor?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. From what you know of the bonus system, and from what you know of objections that prevail generally, has it been the result of your observation that the bonus and premium systems injure the men physically?

Mr. MIXTER. I have not seen it. I heard a particular workman whom I trusted to speak the truth say that a particular job that he worked on for five days at a time was arranged so that the time was set a little close. Of course, that will happen, and if he was not too proud to kick he could go and have it changed.

As for the Acme, you ought to see those girls when they get onto four or five cars Saturday noon, going home—well-dressed and good looking and healthy and well fed. They are not candidates for some nervous recuperation asylum—not much. Of course, I have not been there very long; but I am told by a man whom I believe that their improvement since the system was installed is very marked. They live better and eat better, and they are a better looking crowd than they used to be. I asked him whether that was not because a lot of new ones had come in by selection, and he said "No."

Commissioner WEINSTOCK. We have been talking a good deal the last several days about what constitutes the missing link between capital and labor. Do you believe that the trade agreement is that missing link between capital and labor, organized on both sides?

Mr. MIXTER. Yes; and I have written some things about that, and even have gone so far as to prepare some legislative bills.

Commissioner WEINSTOCK. You are a believer in the trade agreement?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. Does the bonus or premium system in any way interfere with the carrying out of trade agreements?

Mr. MIXTER. No. The more things you bring into any trade to agree upon, the more elements, the more difficult it is to come to an agreement, of course. A simple thing is easier to bargain over than a complicated thing, naturally.

Commissioner WEINSTOCK. You mean that the bonus and premium system add to the complexity of the situation?

Mr. MIXTER. Yes, but it struck me yesterday that Mr. Tobin said that the shoe workers like the piece-rate system, on the whole. Notwithstanding he said it probably injured their health, they seemed to like it, but that the laboring people pretty generally did not like it. The probable reason for that is that historically they got it early, and that through many battles those piece-rate scales have been woven into the system of contracts and understandings with their employers, and now they do not want the other thing, because it is new, and they say, "Oh, that will make trouble with us and we will have to fight all over again, and fight for fresh agreements." Very likely that is the only objection to it, but in itself it would be a decided improvement upon the piece rate.

Commissioner WEINSTOCK. Summing up all that has gone before, your judgment is that the piece-rate system is unwise?

Mr. MIXTER. Most decidedly.

Commissioner WEINSTOCK. Unscientific; and that the bonus premium system, while, perhaps, not the best conceivable, is to-day the best possible, because it is based on scientific methods?

Mr. MIXTER. There is a good deal of difference between the bonus and the premium systems.

Commissioner WEINSTOCK. You do not treat them as synonyms?

Mr. MIXTER. Not at all.

Commissioner WEINSTOCK. What is the difference?

Mr. MIXTER. In the premium system the time allowed is not a time necessary and usual, set by time-study methods, but simply a time from which the premiums begin, and is set by guesswork or past experience of the shop, and from that point, say five hours on a job, the premiums begin. Oftentimes the value of the time saved is half.

Commissioner WEINSTOCK. How about the bonus system?

Mr. MIXTER. On that same job, for example, by time study you would find that three hours and a half is the time for that job, and then the bonus begins with a jump.

Commissioner WEINSTOCK. We would stick to the bonus system then; the piece system is objectionable?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. And the bonus system is desirable?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. Would you have collective bargaining in the beginning on all things other than determining a bonus?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. You would give labor a voice when the machinery was running smoothly and experience had been gained?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. You believe that the trade agreement is the missing link?

Mr. MIXTER. I believe that it is a big thing.

Commissioner WEINSTOCK. You do not think that the objection of organized labor against that bonus system affecting man physically will stand?

Mr. MIXTER. No, no; I don't think it will stand.

Commissioner WEINSTOCK. You think that that is the alleged reason, and not the real objection on the part of organized labor?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. You think the real objection on the part of organized labor is the fear that the bonus system might undermine unionism?

Mr. MIXTER. That is it.

Commissioner LENNON. I understood you to say that if there is to take place a change in the factory by the introduction of this system the employees are entitled to be consulted before the change is made?

Mr. MIXTER. The employees?

Commissioner LENNON. Yes. In other words, that the change can not be made without consultation with the employees and without their consent?

Mr. MIXTER. They do it; they make the change.

Commissioner LENNON. On what hypothesis do you base the claim that the employees are not entitled to consultation before the change is made?

Mr. MIXTER. The system of industry under which we live. We have not got a complete democracy in industry yet.

Commissioner LENNON. Well, if that is true in industry, why should not we apply it all through—social life and governmental life? Why should not we employ it everywhere, and say that one class of society must be consulted and their consent must be obtained, and the other class must not be consulted?

Mr. MIXTER. Well, we get into very deep water on those questions.

Commissioner LENNON. I know that.

Mr. MIXTER. If we had democracy in government centuries ago, the advance of civilization, in my opinion, would have come to a standstill; we were not ready for it. It is a modern luxury, in a way, that would increase the health and everything else; but now, at least, we can come to a great ideal that no other age dreamed of, the full participation in it by free men in society—no helots. It is a great, big thing; it is common law, and in the nature of things it must come a little bit slowly.

Commissioner LENNON. But if this principle is recognized as being correct, as to the introduction of what is called scientific management, why should it not be employed if the employer desires to change the laboring hours from 10 to 14 hours a day? Should he have the right to put in a 14-hour day instead of a 10-hour day or an 8-hour day without consultation with the employee—with the people who have the work to do?

Mr. MIXTER. I think going from a 10-hour day to a 14-hour day ought to be prohibited by law, and it ought not to be left to the employees to fight it out with him; it should not be allowed.

Commissioner LENNON. Then in this case you do not desire to bring in the outside arbitrator?

Mr. MIXTER. The necessary rules of society on a broad matter like that are very different from an outside arbitrator trying to settle all the little disputes that arise in an industry that nobody but the insiders know anything about. Your Congress can know about 14 hours a day, but not about whether a certain job is new work and the scale applies or does not apply. That is not a thing they would know about.

Commissioner LENNON. Can not the employees know anything about these questions?

Mr. MIXTER. Certainly; through collective bargaining they can do that.

Commissioner LENNON. But collective bargaining—there are some people who have had experience in the world as well as professors—collective bargaining, if it is to be effective and worth anything, must be at the initiative point and not after a plan has been established in a factory.

Mr. MIXTER. It can not come in to remedy faults in its initiation. It is not worked that way in the realm of government. On the whole the administration fixes the law and does things first, and it is changed afterwards.

Commissioner LENNON. My conclusion differs with yours, although you are an expert and I am only a layman, but I have not found that in my reading. But never mind that; that is outside of the subject.

Now, what kind of work is made by this Acme Co.? What is the nature of the product there?

Mr. MIXTER. They make coils for electrical magnets, coils of wound wire.

Commissioner LENNON. What is the proportion of women employed to men?

Mr. MIXTER. Nearly all of the work in the rooms is done by the men; a little of it is done by the women.

Commissioner LENNON. I understand you have been there but a short time, but perhaps you know something of the policy that is to dominate the future of the concern. What opportunity is there going to be in that factory for anyone to really learn the trade?

Mr. MIXTER. As much as in any other factory where similar work is done, if not more.

Commissioner LENNON. You anticipate, then, if these girls employed, if they stay there five years, they can go out and work in some other factory at perhaps the same identical work, or work involving the same mechanical principles, where those mechanical principles are in vogue? Can they do it in some other factory and make good?

Mr. MIXTER. I should think they could go out and obtain higher wages, these very girls; they are decidedly improved. There is no doubt about that.

Commissioner LENNON. As you understand it, in whose interest are these efficiency systems introduced, in the interest of the employer to accentuate profits, or in the interest of the working people to increase wages?

Mr. MIXTER. Of course, under the entrepreneur system, it is the proprietor that sends for the efficiency man and puts him on the job, and he is actuated partly, if he is a "white man," or particularly by the desire for profits, and partly by a desire for other things, and if the heavy wheels runs smoothly, it is something he can take pride in. If he is the other kind of man, all he thinks of is the profits.

As to the installer, all that I know most decidedly have a professional spirit, and they care for the welfare of the help, and when they find some proprietor that wants to hire them at the hog time, they do not want to work for him and they leave him—quit him.

Commissioner LENNON. Suppose you go into a new establishment, or an establishment that has been in existence for any length of time—it makes no difference how long—how do you fix the basic wage, the daily wage at which you start? Suppose there are a dozen factories in the city; how do you fix the wage in the factory where you are going to install your ideas.

Mr. MIXTER. Of course I haven't done any hiring myself; I have simply left it to others. I have always done that. You understand I have not done that myself, but it is the prevailing wages for the different trades in the community or district; that is the base rate.

Commissioner LENNON. That is, you take all the factories and find the average, or do you take the base wages prevailing in the community?

Mr. MIXTER. That I can not say. Presumably the average is somewhere between the lowest and the best. I have not done that work myself, and I could not say.

Commissioner DELANO. This commission is very anxious to find some common ground in which the parties at interest can agree, and if there are any fundamental principles upon which we can agree, it is very desirable to find them. Do you think there are such?

Mr. MIXTER. Well, there are some fundamental considerations in the way.

Commissioner DELANO. I mean by "fundamental" principles that apply with equal force to the employer and the employee, something where both can have a common ground on which to agree.

Mr. MIXTER. I have something in mind that may not answer your question exactly, but I would like to say it. It is suggested by your question, that I think the commission might well take the view that it is a very dangerous and undesirable thing for Government interference in the infancy of any art. Of course, scientific management is new, and of course it is going to be improved. It is something like the steam engine in the days of Watt and Bolton, and much ingenuity has been put on improving the steam engine since then. This is going to improve. I believe that everything that is objected to now will be smoothed out.

As regards the tax and bonus, the slight amount of error that I injected into some of my answers—I believe that the art can be improved so that it will be amended, and I think it will be most regrettable that if on the ground of some blemish and wrong now some obstacle were put in the way of development and growth.

Commissioner DELANO. Mr. Lennon asked you in his questions—scientific management—he asked you in whose interest it was usually invoked, and you said in the interest of the employer. That is equally true of labor-saving machinery, is it not?

Mr. MIXTER. Why, yes; under the entrepreneur system of cost a man buys a machine and puts in the system that he owns and buys. What I mean by that is that he is a dictator.

Commissioner DELANO. I mean the employers that have vision enough to see the value of improved methods or improved machinery; it is a minority rather than the majority that sees the advantages of things of that kind?

Mr. MIXTER. They are materialists in that way of thinking. Almost everybody is shortsighted and does not get the big idea. If they only saw scientific management and collective bargaining, all of it, was the most valuable machine that they could possibly put into their works—if they could only see that they would do it.

Commissioner DELANO. It is no reflection on the employees in a factory, is it, that they do not suggest the introduction of new methods?

Mr. MIXTER. It is no reflection on them, of course.

Commissioner DELANO. It has been stated as a fundamental economic truth—it was stated, I think, by Mr. Taylor yesterday—that it is impossible for the workingman to progressively improve his condition either in wages or in working conditions unless there is an improvement in efficiency—that is to say, an increment in the actual per capita output. Is that true?

Mr. MIXTER. Yes.

Commissioner DELANO. Does your own study and observation convince you of that?

Mr. MIXTER. Most decidedly. I have given a great deal of attention to that. I wrote my thesis on the theory of overproduction. An increased production, of course, is the basis of our whole civilization and the welfare of others. I have an idea on that point. I think the big thing that labor can get out of scientific management is shorter hours. Some questions were asked yesterday which indicated to me that the idea was, would it last? How about the long run? Say you get your 30 per cent now. It is in the nature of things that every art diffuses its effect. In time it is eliminated. It all goes in simply increasing wealth all around. The general public gets it, and our civilization is advanced on the material side. If we are going to have any one big thing to point to, a definite thing that labor will gain out of scientific management, I think it will be shorter hours, and this movement lends itself directly to that. There is no question but what these methods facilitate the movement of the material through the shop. You can do in 8 hours or 7 hours or 6 hours as much as you formerly did in 10 or 12 hours. But if the thing is rightly managed it will not all go in lesser prices and mere higher wages, but in the great big

boon to all working people of shorter hours. I have had enough taste of regular hours so that I know what it means. It is not the health, but it is the time it takes. You can not have citizens of a Republic on 10 hours a day. There is no leisure for the other duties and interests of life.

The CHAIRMAN. Mr. Ballard, have you any questions?

Commissioner BALLARD. Professor, I understand you think it is possible to get some group of employers and some group of employees who can together agree upon some basis of fundamental principles that could be mutually accepted by the public generally as right and fair between the two.

Mr. MIXTER. It has been done in some industries.

Commissioner BALLARD. Have you written any books on that subject?

Mr. MIXTER. No; but I have studied it somewhat.

Commissioner BALLARD. In making these investigations with regard to the time studies, it has been suggested that the employee does not have any representative who stands with the scientific engineer to make those studies. Does the employer usually have some representative who stands by the side of the scientific engineer, or does the scientific engineer work out those things as an engineer and then present them to the employer?

Mr. MIXTER. If he makes mistakes he gets into trouble with several people. There is a system of checks and balances.

The CHAIRMAN. The question is, does the employer go with him when he is making his studies?

Mr. MIXTER. No; certainly not.

Commissioner BALLARD. The objection was that the workman did not have any representative who went along with the scientific engineer when he made his studies. Now, does the employer have a representative with the engineer when he makes his studies?

Mr. MIXTER. No, sir.

Commissioner BALLARD. The efficiency engineer comes as an efficiency engineer, comes at the request of the employer, but makes independent studies by himself and for himself, and then submits them to the employer.

Mr. MIXTER. Rarely does the employer make the time study himself. Somebody connected with the establishment is detailed as time study man, and is taught the method, and is coached by the installer, and then he has to fight it out with the foremen every time he makes a mistake.

Commissioner O'CONNELL. What are the wages of these girls that are working in this electrical goods manufacturing establishment?

Mr. MIXTER. I can answer approximately. In the winding room where the older girls are employed the wages are over \$15 a week.

Commissioner O'CONNELL. And for the younger girls?

Mr. MIXTER. For the younger girls in the assembling room, where the work is very light, it is \$12 a week or thereabouts.

Commissioner O'CONNELL. What are the hours of labor there?

Mr. MIXTER. Ten-hours or a trifle less. I believe it is 10 minutes less than 10 hours.

Commissioner O'CONNELL. How long has the system been in operation there?

Mr. MIXTER. I believe something like three or four years.

Commissioner O'CONNELL. The hours have not been reduced at all under it?

Mr. MIXTER. That I could not say. I do not know.

Commissioner O'CONNELL. Do you know whether hours have been reduced anywhere, where the system has been introduced?

Mr. MIXTER. Only by reading.

Commissioner O'CONNELL. Have you in mind any place?

Mr. MIXTER. The Simonds Co., Pittsburgh.

Commissioner O'CONNELL. What hours do they work?

Mr. MIXTER. That is not fresh in my memory now, but it can be ascertained readily.

Commissioner O'CONNELL. You have been speaking, of course, of the Taylor system. You have no new idea. It is the so-called Taylor system?

Mr. MIXTER. Yes; that is the system. According to my notion that is the orthodox system.

Commissioner O'CONNELL. You are simply an advocate of the Taylor system, not of anything new?

Mr. MIXTER. No; not of the various heterodoxies.

Commissioner O'CONNELL. Under the Taylor system or the idea of a bonus, you say a reduction does not or can not take place under this standard.

Mr. MIXTER. That a reduction of time can not take place?

Commissioner O'CONNELL. A reduction of the wages, of the bonus, a reduction of the 30 or 100 per cent, or whatever it is; that if a man is getting that, and that man leaves, that that will be maintained permanently; that no reduction can take place.

Mr. MIXTER. I could not say definitely about the bonus. I do not know that I ever happened to hear about that; but the thing that has been well impressed on me is that the promise that is made is that the time shall never be changed unless the job becomes of a new character, so that it is another job.

Commissioner O'CONNELL. The wage is based on the man's original day rate—that is the standard.

Mr. MIXTER. Yes.

Commissioner O'CONNELL. Suppose a man is engaged in running a lathe, and his original wage was \$3 a day.

Mr. MIXTER. Yes.

Commissioner O'CONNELL. And the standard rate was made and then a bonus was added, making it \$4 a day.

Mr. MIXTER. Yes.

Commissioner O'CONNELL. Based on his \$3.

Mr. MIXTER. Yes.

Commissioner O'CONNELL. Suppose he quits his job.

Mr. MIXTER. Yes.

Commissioner O'CONNELL. Or supposing he is discharged or dies, or a thousand and one things occur, so that another man must be put on the machine, and a \$2 man is put on the machine instead of the \$3 man? What is the difference then between the \$4 and his bonus rate then? Is not that a reduction in the earning capacity of that man?

Mr. MIXTER. I should rather question the fact, unless the character of the work had changed so that you no longer need a first-class mechanic for that work. If they needed the same sort of a man they would take on another \$3 man.

Commissioner O'CONNELL. Is not there a possibility of the reduction of the total earnings?

Mr. MIXTER. Of course, in the absence of collective bargaining there is always that possibility.

Commissioner O'CONNELL. That is the point I want to get at. What is there to protect the individual by maintaining that original \$3 rate, or a better rate as things improve, unless there is some method of collective bargaining?

Mr. MIXTER. In the long run, of course, in any of these shops there may come a king who knew not Joseph, and in the long run there is no guaranty except collective bargaining.

Commissioner O'CONNELL. As I understood Mr. Taylor yesterday, this system has been exactly standardized and never could be changed; that it was absolutely right. Yet I see the possibility which I have just explained, a possibility of a change of the rate of earnings of the man. The total earnings of 100 people in the factory may have been originally \$300 a day. By the bonus system it may be made \$4 a day, but at the end of six months, under the new system, the 100 people may be replaced by 100 other people, and their day rate may be changed, and the total earnings of the 100 people may not be \$200 a day.

Mr. MIXTER. I do not think I could quite agree with you. The base rate would be the thing that would have to give way, and although it was not agreed to by the employer, competitive conditions would establish the base rate. On the whole, I am inclined to think that, the bonus once established, it would be an institution in the shop, and you could not change that. A new man coming on would be told right away, "They are putting something over on you. So-and-so used to get such and such a bonus on that job, and they are not giving you what you ought to have."

Commissioner O'CONNELL. I am not speaking of the bonus. I am speaking of the basis or standard on which the bonus is based.

Mr. MIXTER. That, of course, is a thing which is subject to fundamental economic conditions, including the bargaining between employer and employee.

Commissioner O'CONNELL. In the absence of collective bargaining the employee is solely in the hands of the employer.

Mr. MIXTER. He is solely in the hands of the economic forces that govern the situation, which does not mean that the employer has an absolutely free hand to do as he pleases.

The CHAIRMAN. We will take a recess for 10 minutes.

(At 11.23 o'clock a. m. the commission took a recess for 10 minutes.)

At the expiration of the recess the commission resumed its session.)

The CHAIRMAN. Mr. Ballard has a question which he wishes to ask the witness.

Commissioner BALLARD. Prof. Mixer, in your argument you said that the relative positions of employer and employee in a factory might be considered a little like the relative positions of ruler and parliament in Europe, the parliament aiding the ruler in the establishment of laws. Is there any case in history where a king, emperor, or czar ever volunteered to call for a parliament to help him, or were not the parliament forced on the rulers?

Mr. MIXTER. In the nature of things people who have power very seldom like to relinquish it voluntarily until the pressure has come from the people.

The CHAIRMAN. Mr. Garretson has a question that he desires to ask Mr. Mixer.

Commissioner GARRETSON. I understood you to say that you were absolutely opposed to arbitration as the settlement of difficulties of the character that arise between employer and employee.

Mr. MIXTER. I do not want to be a doctrinaire about that; but I mean—

Commissioner GARRETSON. As a general proposition.

Mr. MIXTER. As a general proposition, as a student of this subject I think that trade agreement and not arbitration by outsiders is the way.

Commissioner GARRETSON. Then if a disagreement arises between the employer and the employee in the formation of the trade agreement, that is when arbitration is usually invoked. You disbelieve in that, do you?

Mr. MIXTER. I think it is better for them to wait awhile and see if they can not come together.

Commissioner GARRETSON. Then, in other words, the causes that create industrial unrest of that character, in your opinion, are not the concern of the public? The public has no right to demand any such method of settlement, you think?

Mr. MIXTER. The public might have a right, but it might not be expedient always.

Commissioner GARRETSON. Who would decide whether it was expedient or not to exercise that right?

Mr. MIXTER. In the last resort the parliament elected by the people.

Commissioner GARRETSON. That is all.

Mr. MIXTER. Their decision is final.

The CHAIRMAN. Mr. Manly of our staff has two or three questions he would like to ask.

Mr. MANLY. Mr. Mixer, you testified, if I have your testimony right, that in case the time set for the task was too short, it was revised if the contention of the employee proved to be correct.

Mr. MIXTER. It is all the time, repeatedly.

Mr. MANLY. If the time-study man makes a mistake and sets the time too long, so that it is an easy task, is it revised under those conditions?

Mr. MIXTER. It stands under those conditions.

Mr. MANLY. Is not the tendency, therefore, for the time-study man to make the task time short in order to avoid being called down by the employer?

Mr. MIXTER. Quite the contrary. The employer does not bother him very often, and he does not want to have the continual trouble of having his times challenged, and having to revise them. They laugh at him of course every time that happens.

Mr. MANLY. If he makes it too long—

Mr. MIXTER. Then it stands. He is laughed at even then.

Mr. MANLY. If he continually makes them too long, is not his job in jeopardy?

Mr. MIXTER. If he continually makes them too long, he is a bungling fellow at his job, and of course he gets discredited, if he habitually makes the time altogether too long.

Mr. MANLY. Therefore his interest is to err in making the task short, because that can then be readjusted. Am I right in that assumption?

Mr. MIXTER. No; I do not think so. Of course while I have not done so much of it, myself, I have gone over instruction cards and so on that other people have made, and I think that the error made is overwhelmingly in the direction of making the time too long. There are various reasons for that.

The CHAIRMAN. Prof. Commons has some questions that he would like to ask.

Commissioner COMMONS. You make a distinction apparently between the one who installs the system and those who make the time studies. The one who installs the system is usually a professional man called in as an expert?

Mr. MIXTER. As a rule; yes; I think.

Commissioner COMMONS. The one who makes the time studies is employed by the employer, on his staff?

Mr. MIXTER. He might possibly be in the employ of the installer, but I think he is usually some one in the employ of the concern.

Commissioner COMMONS. In this case the whole issue turns on the time study. Therefore the person who makes the time studies is doing that under the direct control of the employer and not under the control of the outside professional man?

Mr. MIXTER. There is a sort of double control. That is a part of the system of functional foremanship; and under the spirit of the new method, the staff system in place of the old way, the time-study man is partly under the control of the employer and he is partly under the control of the other man.

Commissioner COMMONS. And if the system is installed, after the professional man leaves the time-study man is totally under the control of the employer?

Mr. MIXTER. In the whole system of things that is a system of checks and balances and laws and rules which are very largely adjusted.

Commissioner COMMONS. It is possible, then, for this professional expert to become simply an employer's expert?

Mr. MIXTER. If I have given the impression that in any real scientific management shop there are hogs employed, that is not so. You can not have scientific management under those conditions, and it does mean a new spirit, a new method, a new set of institutions that interlock with one another, and more and more it is becoming impossible to have evasions and tricks and the exercise of autocratic, undesirable power.

Commissioner WEINSTOCK. In the examination of Mr. Taylor yesterday I rather gathered the impression that the expert stands there as the employer's representative. He is seeking to further the interest of the employer to the best of his ability. He is employed by the employer, and he is there to watch and further his interests; is that correct?

Mr. MIXTER. Yes; to a degree; but with that tempering force that comes always with the professional man. You call in a doctor, and you can not order him to do anything, although you are his employer. He has his standards and ideals of the ethics of his profession, and the same with a lawyer of standing.

Commissioner WEINSTOCK. Is that attitude at all in conflict with the statement yesterday made by Mr. Taylor that as a scientific manager his first thought is the welfare of the worker?

Mr. MIXTER. You mean the thought of the installer of the system?

Commissioner WEINSTOCK. Mr. Taylor's first thought. He practically is the installer, because he has been engaged in that sort of work. He stated that his first thought is the welfare of the worker rather than the welfare of the employer.

Mr. MIXTER. I do not question that that is so with Mr. Taylor. He is an idealist, and the conditions under the old-style management, of the everlasting pulling and hauling and tricks and evasions on both sides went against his grain, and there is no question in my mind but what the root of this whole thing was the idea, "I will get a thing that will be a square deal and take the place of all this."

Commissioner WEINSTOCK. You say Mr. Taylor is an idealist?

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. We know that, as a rule, there is a conflict between the worker and the employers.

Mr. MIXTER. Yes.

Commissioner WEINSTOCK. Mr. Taylor or Mr. Emerson—I have forgotten which it was—pointed out yesterday that you take the cost of the material and the cost of the overhead expense and deduct that from the selling price you get the difference, which is the surplus; and that the issue arises in the distribution of that surplus between the employer and the worker. Now, there is a conflict there, each naturally wanting the larger share of that surplus. So that is a natural conflict. Now, your point of view is that the expert represents the employer's interest primarily and incidentally the worker. Mr. Taylor's point of view was—at least I so gathered—that his first thought is the worker, and the employer becomes an incident in the matter. Now, there is a conflict between your attitude and Mr. Taylor's attitude.

Mr. MIXTER. While I may have given that impression, I did not mean to. I do agree with him upon that. Of course it is a difficult thing to express. The installer is hired by the employer, and he has to work in his interest, and

he must try to make the whole thing not a financial loss. Of course he has his professional attitude to his ideals, and chief among them is to bring a new régime for labor. In respect to the conflict about division of surplus and wages, I am fully persuaded that it is more a great mass of little things, little in themselves, but in the aggregate big, that makes the trouble.

Commissioner WEINSTOCK. He has to sit as a court of equity between the two?

Mr. MIXTER. Most decidedly, and he does if there is any occasion to.

Commissioner WEINSTOCK. And to determine how to distribute the surplus in accordance with his best judgment, wisely and fairly?

Mr. MIXTER. Yes. It is a gain-sharing scheme—the philosophy of gain sharing. An installer is not in a continual fight with the employer, as a rule, because the employer would not be installing scientific management if he had not seen a new light. That is a real, genuine thing.

Commissioner WEINSTOCK. Is the installer a man with full power? Does the employer waive his rights in the matter and subordinate them to the installer and permit him to act as supreme power in the matter?

Mr. MIXTER. To a very great extent after the employer has been persuaded on the main things. He hands it over as a man does a law case to his lawyer.

Commissioner WEINSTOCK. And abides by his decisions?

Mr. MIXTER. Abides by his professional decisions.

Commissioner WEINSTOCK. And does not accept his recommendations subject to his own approval?

Mr. MIXTER. Not in detail. You may change lawyers, but as a usual thing a man does what his lawyer tells him to do, and as a usual thing you abide by his professional decision. To the same degree a man installing scientific management abides by the decision of his installer.

The CHAIRMAN. Mr. Mixter, you stated that you would like to make a statement with reference to the alleged degredation of the stop-watch system. Do that briefly, if you please.

Mr. MIXTER. I have not very much to say about that. I do not think there is anything in it at all. I think the thing is done open and aboveboard. The man knows that he is being timed and why he is being timed, and in particular in my experience, so far as I have done it myself, I should say standing over somebody and asking him about his work, why he does this this way and that that way, and taking his time rather dignifies his work instead of degrading it.

The CHAIRMAN. Is that all upon that?

Mr. MIXTER. That is all, I think, upon that.

The CHAIRMAN. Was there something else that you desired to say?

Mr. MIXTER. Possibly a few things. I would like to make this remark, that I think that the phrase "speeding up" is a question-begging epithet and that it would be much wiser if it were left out, if witnesses would drop it.

The CHAIRMAN. I am not asking too much, am I, if you will confine yourself to any little element of fact that you know instead of arguing, because we have a number of witnesses. I do not want to cut you off, but if there is any fact that you think is significant I wish you would state it and not argue it.

Mr. MIXTER. I understand. There is one statement of fact, and that is that there is a misapprehension in respect to the taking of time studies. Unfortunately on the observation sheets at the last is a column headed "minimum time." That has probably given the impression to a lot of people that we picked out the shortest time. That simply happens to get there by somebody who did not happen to think of the right word. It is the representative time and never the minimum time.

The CHAIRMAN. That is all. We thank you very much, and especially for waiting over.

TESTIMONY OF MR. ROBERT G. VALENTINE.

The CHAIRMAN. Mr. Thompson, will you be good enough to interrogate Mr. Valentine?

Mr. THOMPSON. Will you please give us your name and address?

Mr. VALENTINE. Robert G. Valentine; 75 State Street, Boston.

Mr. THOMPSON. What is your profession?

Mr. VALENTINE. Industrial counselor.

Mr. THOMPSON. Please state briefly to the commission what you mean by industrial counselor.

Mr. VALENTINE. I mean a man who is devoting all of his time to studying the relations between employers, employees, and the public.

Mr. THOMPSON. How long have you been engaged in that occupation?

Mr. VALENTINE. Specifically about 2 years; in principle for the last 15 years.

Mr. THOMPSON. What were you engaged in before those two years?

Mr. VALENTINE. I was Commissioner of Indian Affairs here in the city of Washington.

Mr. THOMPSON. In the last few years, as a student of the relations between employer and employee, what experience, if any, have you had with the so-called efficiency systems, naming places and where?

Mr. VALENTINE. I have run into it on the slant in a number of places. I prefer not to name all of the places, because my work is of a professional character.

Mr. THOMPSON. Name the number, if you can, without naming the individual plants.

Mr. VALENTINE. A half dozen cases.

Mr. THOMPSON. Have you in these examinations been called upon to make a fairly extensive study of the relations between the employer and the employee?

Mr. VALENTINE. Yes.

Mr. THOMPSON. Are there several efficiency systems, so called, on the market, if I may use that term, open to the choice of the employer?

Mr. VALENTINE. Several so-called ones.

Mr. THOMPSON. Is it not uniformly the case that the efficiency system is put in at the instance of the employer?

Mr. VALENTINE. If I may be pardoned, I think it is absolutely futile to generalize about these things, and I also think it is likely to leave a mistaken impression with the commission if you delve into some of the details before getting the general principles and points of view clearly before the commission. For instance, I was very sorry to see so much emphasis put upon the payment plans in the case of the last witness. It seemed to me it was leading the commission astray. You will pardon me for that criticism.

Mr. THOMPSON. Have you a concise statement that you would like to make in accordance with what you have just suggested to the commission?

Mr. VALENTINE. I should not want to make any statement, because it does not seem to me that a public hearing is the place to do that. In a word, it seems to me that a good many of us are here upside down and wrong end first on this whole thing. Briefly, just to be personal, in order to be concrete and short, I am a thorough-going democrat first, and a believer in the best ways of doing things as a pretty close second, and I think that must be the direction from which you approach the thing.

Mr. THOMPSON. In other words, if I understand you, you believe that the introduction of an efficiency system must come from democracy. Is that right?

Mr. VALENTINE. With a very humble sense of the dangers, I still feel that the dangers from that direction are less than any other.

Mr. THOMPSON. Then, from that principle which you have as a cardinal principle of your view on the relations of the employer and employee, would it not be essential that the employee in any given shop should participate from the beginning in the introduction of any efficiency system under which he should be required to labor?

Mr. VALENTINE. I not only think the individual should so participate, but I think he should participate as a part of the union.

Mr. THOMPSON. Then you believe that in connection with the introduction of the efficiency system there should come in, as one of its first principles, the effect which we would call collective bargaining?

Mr. VALENTINE. Yes, sir; and the whole system of constitutionalism and industry as leading to democracy in industry.

Mr. THOMPSON. What do you mean by the term "constitutionalism in industry"?

Mr. VALENTINE. I mean a rather condensed progress in the present day of precisely the same thing we have seen going through the political governments throughout the world—principles of representative government, of checks and balances, of all concerned having a voice and being connected with an educative process in making determinations.

Mr. THOMPSON. Mr. Mixer, the last witness on the stand, stated to the commission that in the introduction of an efficiency system in any plant or shop such introduction should be at the instigation of one of the parties, namely, the employer, and that in this introduction the participation of the employee would lead to confusion, or at least would very greatly hamper and hinder the

efficient introduction of the efficiency system. What have you to say on that point?

Mr. VALENTINE. I disagree with Dr. Mixter. I prefer confusion to catastrophe.

Mr. THOMPSON. Why, from your experience, do you prefer confusion to catastrophe?

Mr. VALENTINE. Because I think we have in our modern life two ideals which have got to work out together—science and democracy. I think every one of us recognize that if you could have a beneficent despot, omniscient and omnipotent, he could make the world better at once. I simply do not think that is a feasible ideal.

Mr. THOMPSON. That is what follows from what you say, Mr. Valentine, if I reason correctly, that that would be better than no efficiency system be introduced at all than that such a system should be introduced without the concurrence and the cooperation of the employees? Is that right?

Mr. VALENTINE. In the interest of trying to clear the air, I will assent to that absolutely. Of course, you will recognize, and all of you will recognize, there are common-sense ways of approaching these things, but that is the principle, and it is right.

Mr. THOMPSON. From your study of the relations of employer and employee, what is it in that relationship or in those relations which makes you feel that the introduction of these efficiency systems can be made to accord with democracy?

Mr. VALENTINE. Because, in my experience, I have found that neither side possessed a monopoly of the brains.

Mr. THOMPSON. Have you had any practical experience in any case or cases wherein efficiency systems have been introduced with the cooperation of the employee?

Mr. VALENTINE. I have slanted on them. I have not been very deep into it.

Mr. THOMPSON. Give us your slant.

Mr. VALENTINE. I know one store where that is going on at the present time. I know of a printing plant where it is going on at the present time.

Mr. THOMPSON. That is, the introduction of the system?

Mr. VALENTINE. Yes, sir; although, please pardon me, I do not like tags; I do not like the words "system" or "efficiency." I like the words "democracy" and "doing things in a scientific way."

Mr. THOMPSON. You may use, of course, Mr. Valentine, your own words.

Mr. VALENTINE. I want simply to indicate that I think we lose a lot if we do not get below a lot of the tags that have been bruted around the world in the last 10 years down to the essential principles for which these tags more or less incompetently stand.

Mr. THOMPSON. Are you aware of any case where, now using the accepted phrase, efficiency systems have been introduced without the concurrence of the employee, which has resulted in any injury to the employees of the shop?

Mr. VALENTINE. It seems to me that is too big a question for any man to answer. I should not feel that my answer was of any value to this commission, and in evading answering I would suggest that, for instance, when this commission is in the neighborhood of Boston it go out to and hold a hearing on the grounds within the walls of this one at the Plympton Press at Norwood. That visit would be worth hours of my taking your time here.

Mr. THOMPSON. How large a plant is that?

Mr. VALENTINE. That is a fair-sized printing and bindery. I do not recall the number of employees, but it has worked out a great many of the principles which are here in debate.

Mr. THOMPSON. You do not know whether they have 500 or 1,000 or 2,000 employees, or more or less?

Mr. VALENTINE. I should say about 1,200. [Addressing some one in the audience:] Is that right? About 700 or 800.

Mr. THOMPSON. If there is anybody in the audience who knows—

Mr. VALENTINE (interrupting). That is right. He has tipped me off. [Laughter.]

Mr. THOMPSON. Will you describe, if you know, Mr. Valentine, the method by which the so-called efficiency system or scientific management was introduced into either this last-named printing shop or elsewhere that you know of? What was the machinery used to bring the employee and employer together?

Mr. VALENTINE. I would be glad to answer that question if you insist on it, but I think it would be a waste of your time. It is a thing so complicated, so

much a shop detail, that if this commission really wants to know what is done there, it should go and see. You can not get at these things, it seems to me, by sitting up here with a public hearing.

Mr. THOMPSON. To divide the matter up, Mr. Valentine, did the employees have a voice in the selection of the expert who took time studies, if they were taken?

Mr. VALENTINE. I think not, sir.

Mr. THOMPSON. That person was employed by the employer?

Mr. VALENTINE. I imagine so.

Mr. THOMPSON. Were the conclusions of the time-study expert subject to review by any committee or body of which the employees comprised an equal proportion with the employers?

Mr. VALENTINE. I am not sufficiently familiar with the details of that particular place to answer that question.

Mr. THOMPSON. Then, why do you say, Mr. Valentine, if I understood you correctly, that the employees in that shop participated and cooperated in the introduction of the efficiency system?

Mr. VALENTINE. I do not really think I said that. I think they had had some hand in many aspects of it, because in certain branches there they have collective bargaining on hours and wages, and have had for some years.

Mr. THOMPSON. In this particular shop?

Mr. VALENTINE. In this particular plant; yes, sir.

Mr. THOMPSON. Do you know on what matters they have a trade agreement?

Mr. VALENTINE. They have trade agreements on hours and wages with certain local unions, but I could not tell you off the card. That is the kind of thing a person hates to answer except from the records; there is so much loose talk about these things.

Mr. THOMPSON. Leaving out of consideration the name of any plant—there may be some reason to not state it—what voice, if you know, have the employees had anywhere, either in selecting the expert who made the time study, or on a committee who should finally accept or reject his conclusions after the time study?

Mr. VALENTINE. Speaking generally, I should say the employees, either individually or collectively, had had very little voice in such selection.

Mr. THOMPSON. Then, you know of no plant where this occurred?

Mr. VALENTINE. Not in a way that I should personally consider ideal.

Mr. THOMPSON. Then, your conclusion or your statement in the beginning was a statement as to what you think should be done from your study of the relations of the employer and the employee?

Mr. VALENTINE. Yes, sir.

Mr. THOMPSON. In your opinion, Mr. Valentine, would that obviate or tend to obviate the complaint over the so-called speeding up, which unions make against efficiency systems?

Mr. VALENTINE. It would, sir.

Mr. THOMPSON. Even to the extent of reiterating what has already been well said, I understand, Mr. Valentine, that you believe in the principle of collective bargaining as applied to the introduction of efficiency systems or scientific management in shops and factories?

Mr. VALENTINE. Yes, sir.

Mr. THOMPSON. That is all.

The CHAIRMAN. Prof. Commons, are there any questions you desire to ask at this time?

Commissioner COMMONS. Mr. Valentine, it seems to me the terms which you have used have been quite vague and general. They have been terms of political science, of government, rather than terms of shop. I presume you certainly have thought this out in terms of shop management; and while you say that we can not get the general principles here, but we must go and visit the factories—

Mr. VALENTINE (interrupting). I beg your pardon; may I interrupt?

Commissioner COMMONS. Yes.

Mr. VALENTINE. To get detail you must go and visit the factories; to get scientific appreciation you must visit the factories. I do not think the kind of things you have had this morning bring out those principles.

Commissioner COMMONS. Would it not help, in visiting the factories, in order to ascertain the detail, to first get some principles that we might apply or test as we go into those factories?

Mr. VALENTINE. Very greatly, sir.

Commissioner COMMONS. You certainly must have thought out some principles or some standard of tests, as here you have two very conflicting things. They have always conflicted in the history of government and in the history of industry—efficiency and democracy. I suppose that would be stating it in the way you would state it?

Mr. VALENTINE. I very much like that way of stating it.

Commissioner COMMONS. You have figured out, evidently, some way of harmonizing these two, and it must be upon some general principles. You must have developed them fully. This commission certainly has not.

Mr. VALENTINE. No wise man has.

Commissioner COMMONS. It is up to this commission to develop such principles. If we can not, we will have to say so. Would not you assist us by starting off on some principle of harmonizing efficiency and democracy in the shop on what would perhaps be a more general principle which you would lay down and then pass on to some more detailed principle?

Mr. VALENTINE. If the commission request it, I would be glad to be that goat, if it would really help you in your work.

Commissioner COMMONS. Suppose we start out on that idea, that you will be the goat [laughter]—and you are not committed to anything that you suggest or propose as principles. But we would like to have some principle of this character. It seems to be quite fundamental. If you will mention what occurs to you in any order, we shall be glad to hear it.

Mr. VALENTINE. I will be glad to do so, if the commission will very rudely check me up if I get astray or take too much time.

It seems to me that if we are going to get at this thing right we have got to be, at the start, pretty vague, because we have got to be comprehensive; we have got to see the whole field. We can not peck into it at any point. A good deal of what I have to say will strike you as vague, ideal, and merely hopeful of a future condition; but there again it seems to me that unless we see where the trend lies we will be continually getting off the road. With the best vision we now possess we have got to fix our eyes on the mountain peaks and then climb up for them. So again I will ask you to excuse things that seem general or abstract.

I have had a number of, to me, very significant experiences in the last 10 years which led to this tentative idea that I now hold. At the present time, for example, I am serving as chairman of the first wages board of Massachusetts.

Commissioner COMMONS. You mean under the minimum-wage commission?

Mr. VALENTINE. Yes. At the table are grouped six representatives of employees, six representatives of employers, and three representatives of the public.

I would like to say, if I may—and this particular sentence I would like not to have put on the record, because it might injure some of the things we are trying to do before that board; but I will give you confidentially and as vaguely as this audience can remember it what is happening there.

The CHAIRMAN. Mr. Reporter, please omit this until such time as the speaker indicates you are to go ahead.

(Here ensued a statement by Mr. Valentine and some informal discussion between Mr. Valentine and the members of the commission which, by direction of the chairman, was not spread upon the record.)

Mr. VALENTINE. Among the employees on that board is a representative from the cigar makers' union; also a representative from the telephone operators' union, a young girl with whom I was associated in a recent fight of Boston against the telephone company, where we won some quite substantial victories. In addition there are four brush workers—this is a board in the brush industry. One of those has shown very keen judgment. So there are three of the workers whom I would consider an addition to any council table. Please do not think I am sentimental about this or making any plea for the down-trodden workers. They do not need it from me.

Commissioner COMMONS. Three of these apparently represented organizations of labor and the others were unorganized employees?

Mr. VALENTINE. Two represent the ideas and training and intelligence of organized labor and four represented the unorganized employees in the brush business itself.

The point I would like to bring out is that I consider, from what little insight I have got into it, the kind of debates that are going on around in trades-union rooms is the hope of democracy in this country; in stating this point very briefly and without elaborating it, I trust you will realize that they need to be

elaborated before they are finally accepted, but to save your time I will just state them.

It may save your time further by briefly summarizing the facts that experiences like that on the brush board, and experiences in a number of factories and stores and various other plants have led me to feel that is one of the inescapable elements of the situation, and the right point of view. I have been very much interested in learning all I could about the system that is before you under the label of scientific management, and I am losing no opportunity to investigate the workings of that system, and I am frank enough to say that I have not got far enough at the present time to feel that my testimony on that particular point is of any value further than I will now lay before you.

In the first place I believe in constitutional democratic government developing steadily in industry as it has developed in politics, and tending toward an honorable democracy in which everybody from the most skilled to the unskilled laborers will have a generally recognized opportunity. That seems a little too much like a political speech and a little grandiloquent.

Commissioner COMMONS. Will you state that in terms of shop industry? What does that mean?

Mr. VALENTINE. It means this, in a certain plant they have two ideals, the cooperative ideal on the one hand, and an attempt on the other to pay dollars per unit of efficient service rendered. The present result to-day is, the way it is lined up, that there are two hostile ideals at each other's throats. The thing is being conquered by the establishment of a very carefully worked out series of committee systems in that particular plant, and not merely by harmony committees, or other details, but one committee which gathers together all the opposing elements, and the elements which if left alone would be most destructive of real cooperation in that concern. The tendency is steadily growing to keep these now rather hostile ideals from remaining longer at each other's throats, and endeavoring to make them become useful, in reconciling hard-fought differences of opinion in that concern, by which the concern will really grow. The question of discharge, the question of discipline, in that particular concern, is handled by the employees, and the employees do things that no autocratic employer in the world would dare to do; and they are just about it; they are very just.

Commissioner WEINSTOCK. You say that is the prevailing condition in a certain establishment?

Mr. VALENTINE. Yes.

Commissioner WEINSTOCK. Would you object to naming it?

Mr. VALENTINE. I would not be allowed to name that particular concern.

Commissioner COMMONS. Interpreting that in terms of what you mean by constitutionalism, it means that all the elements of employer and employee, those two elements should be represented on committees dealing with the particular issue or a number of issues; to use your idea, that there should be an odd party jointly selected by both sides to sit with them?

Mr. VALENTINE. My mind is in a very fluid state in regard to that. I think so far as possible the method of conciliation without a third party is wise. I am inclined to think—for instance, it was suggested to me by the preceding testimony—I am inclined to think that the ideal arrangement for the future in regard to systems of efficiency would be to have—supposing you had the time-study man, there would be one time-study man representing the employer, and another time-study man representing the union, and that the expert, so-called installer of the system—I don't like that word, but I will not spend my time objecting to words—the so-called installer of the system in that case, so far as he brings scientific knowledge which neither side possesses, would alone be the third party, who would have the final word.

Commissioner COMMONS. Who would have the final word?

Mr. VALENTINE. In the final analysis I think an organization in which both the employer and employee were represented would have the final word. Under other cases, as is now the case under the protocol in New York, where the wage-scale committee, as you know, is paid equally by both sides, some system of arbitration can be devised.

Commissioner COMMONS. They have an odd man that they have agreed on?

Mr. VALENTINE. Yes.

Commissioner COMMONS. You think a system of that kind could, by your installing scientific management, conduct its continuous operation thereafter? I am referring now to the distinction made by Mr. Mixter, which you heard?

Mr. VALENTINE. Yes.

Commissioner COMMONS. What is your idea about the differences in dealing with these two questions by such an organization as you propose?

Mr. VALENTINE. If I understand your question—and if I do not answer it please check me up—I think the situation that we have developing under the protocol in the garment trades—that is, the labor wage scale board—is one of the experiments that is most worth trying at this time, and they will go on from the statistical side of the situation to a real scientific analysis of all the rates in that industry, and that will, after receiving the approval of representatives of the unions and representatives of the manufacturers, be the common and statute industrial law of that industry.

Commissioner COMMONS. That is on the piece rate, which in the efficiency system would be that each time study would be conducted by this joint board of three?

Mr. VALENTINE. It would be conducted by this board of three through its expert, paid half by the workers and half by the employer.

Commissioner COMMONS. Who would have the final decision?

Mr. VALENTINE. The machinery now in existence, which I think has been very carefully outlined to you.

Commissioner COMMONS. Which would be this arbitrator; this odd man?

Mr. VALENTINE. Yes.

Commissioner COMMONS. And in cases where they could not agree he would decide?

Mr. VALENTINE. Yes. Personally, I think such a board should consist of three men; I think it would be unwise to leave it to one man.

Commissioner COMMONS. That is a detail?

Mr. VALENTINE. That is a detail.

Commissioner COMMONS. Would you introduce this at the beginning of the installation of the system?

Mr. VALENTINE. Yes.

Commissioner COMMONS. Have you thought out how you would take it up with the union and with the employer?

Mr. VALENTINE. Yes.

Commissioner COMMONS. How would you do that?

Mr. VALENTINE. I would go straight to him, which, simple as it sounds, is not often done.

Commissioner COMMONS. And that is another detail?

Mr. VALENTINE. That is another detail.

Commissioner COMMONS. Now, then, as I understand it, the general principle you have is that efficiency can be harmonized with democracy; it is recognized that there are two antagonistic elements, and they proceed to install efficiency under their joint direction, with the odd man agreed upon between them to settle points where they can not agree. Does that sum up the statement?

Mr. VALENTINE. That would sum it up pretty well, except that I think a little wrong slant is given by the emphasis you put on the odd man. I think a board of five should sit on that proposition, made up entirely within the industry, or with an outsider who knows the industry, or one or two outsiders who know the industry, I think that board could make a finding which would not be arbitration in the usual sense of the term, that will insist upon such a presentation of facts that, even on a board of that kind, the finding will be very likely to be unanimous.

Commissioner COMMONS. Have you undertaken to install a system of this kind in any place?

Mr. VALENTINE. This committee work?

Commissioner COMMONS. Substantially what you have stated.

Mr. VALENTINE. Yes; I am doing it in two places now.

Commissioner COMMONS. Two places?

Mr. VALENTINE. Although I do not like to call it installing, because I am not an efficiency man myself and not an engineer or anything of that sort. My whole duty is that of studying the relations between employers and employees, and I only come to the engineer and the accountant on the edge of things.

Commissioner COMMONS. We would like to get a name for your job so as to identify it with some things possibly that have been before us. Would you be called a negotiator between capital and labor?

Mr. VALENTINE. No; because my only interest is in trying to produce the facts on which my client, whether he is an employer or an employee—and I have had both kinds—can act. I am not a compromiser or an investigator. I am just as much of a scientist in my field of establishing relations between employer

and employee and their relation to the movement of the times, as is the engineer in his field or the chemist in his field. I call it an industrial counsellor, for lack of a better name.

The CHAIRMAN. He calls the work industrial counseling, and he would be called an industrial counsel, perhaps; is that right?

Mr. VALENTINE. Yes.

Commissioner COMMONS. Can you give us samples of anybody else in the country who is doing anything like that?

Mr. VALENTINE. I think I am the only crazy person.

Commissioner COMMONS. So we can not class your profession?

Mr. VALENTINE. I hope there will be a lot more; I think it is a profession in itself.

Commissioner WEINSTOCK. Prof. Commons, we might get some light on it if you would ask him just what his function is in a plant; just what he does.

Commissioner COMMONS. I rather thought he had described that pretty well, telling how he has handled this minimum-wage negotiation.

Commissioner WEINSTOCK. No; he is an official there, a State official.

Mr. VALENTINE. But still true to my private job.

Commissioner COMMONS. As I said, you simply try to act for both sides?

Mr. VALENTINE. Yes. I think I am at perfect liberty to mention this telephone situation, because it has been made public outside of myself. In adopting a professional attitude about these things, I do not talk about them unless my client makes them public, and this is a public record.

Very briefly, some months before anybody in Boston knew that there was likely to be trouble, the telephone operators consulted me about certain demands that they were planning to make. We worked those over for a period of six weeks, until finally, when things reached the crisis and things were on the verge of a strike, and the company had introduced several hundred strike breakers into Boston, these met in conference with members of the Boston Chamber of Commerce and with officials of the company, and they had so prepared themselves that they won point after point hands down, and among other things they won was the little tentative, puny beginning of a joint board for the telephone industry in Boston.

Commissioner COMMONS. And in that instance you would probably be called ordinarily the business agent of the union?

Mr. VALENTINE. Very likely.

Commissioner COMMONS. And in case you had been employed by the employers, what then?

Mr. VALENTINE. The only reason that I have let you drag me into this personal history is because it does illustrate this one thing, which is important, I think, for your consideration. I did not try to help these girls win their case irrespective of whether they were right or wrong; I did not tell them a single thing that I would not have told the telephone company if I had been employed by them. But, to make it concrete, there was a little book that was published by that telephone company which took the attitude of a school teacher with a pupil. It says, "When you speak of this company you will speak of it as our company."

Now, the last thing that hates to be talked to as if she was a pupil is a young girl telephone operator, because she has graduated from school. I told the girls that I thought they had a right to feel bad about being talked to in that way, and if the company had talked to me in that way I would have told them that that was a fool book to issue.

The point I want to make is that it is just as scientific a field and it is just as indifferent, it seems to me, an attitude that this commission could assume—if I might be pardoned for suggesting an attitude it could take, and that it undoubtedly is taking—is that there is a field in these industrial relations, an absolutely neglected field at the present day, which has just as scientific a value and is just as capable of being reduced to human facts, as the engineering field.

Commissioner COMMONS. That would be the general way in which you would go at it—on the lines of democracy.

The CHAIRMAN. We were at a point, if he went into a plant to represent the employer he would give us some information.

Commissioner COMMONS. You yourself are a believer in some system which might be called scientific management?

Mr. VALENTINE. I am absolutely a believer in thoroughgoing efficiency operation. The difference I have with my friends is that I believe in going at it from a different end and a different point of view.

Commissioner COMMONS. You believe in going at it from the standpoint of democracy; is that the only difference?

Mr. VALENTINE. That is a pretty big difference.

Commissioner COMMONS. Would you say that that is the only difference?

Mr. VALENTINE. In essence; yes.

Commissioner COMMONS. I think a number of them expressed very briefly their ideas on collective bargaining as applied to this; I do not know whether you heard them or not.

Mr. VALENTINE. I did not, sir; no.

Commissioner COMMONS. If you should take it up from the standpoint of the employer and introduce a scientific management system in an establishment, how would you, as his agent, then proceed with the employee?

Mr. VALENTINE. I would not proceed until I had put the question up to the employees and got their collective assent to the proposition. Now, a lot of people will say that I am an absolute dreamer and a crazy man; that it would not be possible to get them, but my actual experience in putting things, as I said a little while ago, straight to them, is that if you get the question of control right at the start I think you can do these things.

Commissioner COMMONS. Then you base that on the ground that the laborers are more intelligent than the employers?

Mr. VALENTINE. By and large, I do not think there is much to choose. You know Walter Lipman, I think, has stated that the reason there will never be a class war in this country is that the employers have not got the collective intelligence to solidify themselves into a fighting class, and under our collective system I think there is a great deal of truth about that.

Commissioner COMMONS. Will you think of these things later and take the trouble to write down for the commission a collective formula of your principle, bringing that out in some sort of systematic way? You remember Mr. Taylor presented to us some principles.

Mr. VALENTINE. I did not hear him.

Commissioner COMMONS. You can easily get access to that testimony, and if you could formulate that so that we would have it a little more definitely, I think we would appreciate it. I believe you could do that.

Mr. VALENTINE. I will be glad to do the best I can.

Commissioner COMMONS. That is all.

The CHAIRMAN. Mr. Delano?

Commissioner DELANO. No; thank you.

The CHAIRMAN. Mr. Ballard?

Commissioner BALLARD. I had two or three questions, but I am not certain that it is worth while to take up the time of the commission, but I will ask this: Do you think it is possible to get the employer and the employee together as two different classes, through their committees, to agree on certain fundamental principles which could be accepted by both sides as a starting point for collective bargaining?

Mr. VALENTINE. I do, sir.

Commissioner BALLARD. That has never been done.

Mr. VALENTINE. I think there have been some pretty good starts made in various places. I think there is a strong drift in that direction.

Commissioner BALLARD. Would you accept it as a right principle, which the unions sometimes enforce, that after they have got a shop well organized and known as a union shop, to refuse to use tools or implements of a nonunion plant?

Mr. VALENTINE. I don't believe I quite catch that.

The CHAIRMAN. The stenographer will repeat it.

(The question was repeated by the stenographer.)

Mr. VALENTINE. I am glad you asked that question, but I will answer this question first and then I will add to it. Yes; I consider that their stand against the use of tools that in any way brings them into cooperation with nonunion men is a right principle.

Commissioner BALLARD. Or refusing to work with nonunion materials and things of that kind?

Mr. VALENTINE. I can see 20 reasons why, under certain circumstances, I should consider a union entirely justified in so refusing. I might say, in further amplification of that, that personally—this is my own personal feeling—I have the feeling that if I were a workman and refused to join in or participate in a union, that I should either be as ignorant of or as false to duties as a citizen as if I refused to vote to the best of my intelligence and ability at a political election.

When I say that, I do not mean that I stand for certain attempts to drive nonunion men into a union; neither do I stand for a whole lot of the crimes that are committed in the name of the freedom of individuals. All our legislation, for instance, to keep children out of factories and get shorter working hours has been opposed in State after State on the ground that it interfered with the liberty of the individual. I do not stand for a kind of liberty of the individual that is opposed to those things.

Commissioner BALLARD. To carry out that thought to its limit, if a unionized plant refuses to use the tools or material of a nonunion plant, and if the men were forced through that method to become unionized, then we might give up our whole government to the union man and have no other government; that would be government enough.

Mr. VALENTINE. I am not sure that the day is not coming when the union will be one of the great big factors of the government of the future. Where I would like to modify my answer to that question is this: It has long been my belief, and every month I feel it increasingly, that if employers stopped fighting organizations as organizations and simply devoted themselves to fighting what they regard as economic fallacies, which employers in common with employees and all the rest of us are committing, they would get a lot further.

In other words, while labor unions have to fight for their lives as labor unions, I can not only intellectually forgive them for the things that they do, but my candid belief is that when they no longer have to fight for their organization they themselves will do a lot of things which we now wish them to do.

They have found it necessary because they have been jammed into fighting bodies to do things which friends of mine among them tell me they hope the day will soon come about when these things are no longer necessary; that the time for doing them will soon go by.

Commissioner WEINSTOCK. One question. This is just in passing. Will you be good enough to explain how the two panels of six each were chosen on your wage board?

Mr. VALENTINE. They were selected in this particular case by the minimum wage commission; the commission, I think, would prefer to have them selected, if there had been a labor organization in the industry or any kind of group organization, to have them selected by that.

Commissioner WEINSTOCK. You simply looked among the employers and picked out the six men you thought would be the fairest?

Mr. VALENTINE. The commission did that; the commission that is over us chose the board.

Commissioner WEINSTOCK. You mean that the commission looked over the field and picked out six employers and six workers and three representing the general public and appoints them?

Mr. VALENTINE. But they do it through asking the employers to submit names and make nominations, and through taking the workers as a group, whether organized or not, and asking them to submit names.

Commissioner WEINSTOCK. How can so-called unorganized workers submit names?

Mr. VALENTINE. That was the difficulty that they had. They had to drift through the shops and pick the most intelligent people that they could find. That is the defect in that method.

Commissioner WEINSTOCK. The two sides submitted a list of names, and out of this list of names the commission chooses a panel?

Mr. VALENTINE. Yes.

Commissioner WEINSTOCK. Is it not done by any elective system?

Mr. VALENTINE. No; I think it should be, and there, I think, is a very important point in connection with arbitration proceedings, where, for any reason they have to become arbitrators, they should be picked from panels, so that there will be an easy veto if there are personalities disagreeable to both sides. Some of these people pick out impossible personalities.

The CHAIRMAN. Dr. Barnett, do you care to ask any questions?

Mr. BARNETT. No.

The CHAIRMAN. Mr. Garretson? Excuse me, Mr. Garretson has a question.

Commissioner GARRETSON. You know that there are certain practices indulged in by labor organizations that are in reality nothing but a weapon to be utilized in the fight for existence?

Mr. VALENTINE. I have that feeling; yes.

Commissioner GARRETSON. Now, in relation to this—I want to understand one thing about your present position; that is, as an industrial counselor—you

hold that the vocation of a man in your position is, whether attained by employer or employee, to insist upon the doctrine of accepting the equities as they appear to you?

Mr. VALENTINE. With the exception of substituting facts for opinions.

The CHAIRMAN. Mr. Lennon says that he has no questions to ask, so that will be all, Mr. Valentine. Thank you very much.

We will adjourn now for luncheon, to convene again at 2 o'clock sharp, and after luncheon Mr. Dodge will be the first witness.

(Whereupon a recess was taken until 2 o'clock p. m.)

AFTER RECESS—2 P. M.

The CHAIRMAN. The commission will please come to order. Mr. Dodge will take the stand.

TESTIMONY OF MR. JAMES M. DODGE.

The CHAIRMAN. Mr. Thompson, will you interrogate Mr. Dodge?

Mr. THOMPSON. I have some questions here which have been prepared by the craft, which I will put to you. If afterwards you care to make any further statement, you will be given that privilege. First, I will ask your name, residence, and business.

Mr. DODGE. My name is James Mapes Dodge. I am chairman of the board of the Link Belt Co.

Mr. THOMPSON. Where is that located, and how long have you been connected with it?

Mr. DODGE. The Link Belt Co. has three shops, or four, really—two in Indianapolis, one in Chicago, and one in Philadelphia.

Mr. THOMPSON. How long have you been connected with that company?

Mr. DODGE. For 35 years.

Mr. THOMPSON. And in what positions?

Mr. DODGE. The Link Belt Co. was organized only a few years ago, but I was with one of the component companies—the Ewart Manufacturing Co., in Chicago—35 years ago; and then I have been in that same business with the same people ever since.

Mr. THOMPSON. What did they manufacture?

Mr. DODGE. Elevating, conveying, and power-transmitting machinery. Before that I served two years with John Roach, in shipbuilding, and I have been through every phase, every stage, of mechanical occupation.

Mr. THOMPSON. Now, I will put to you the first question that is prepared in written form here: "Please give a brief account of the introduction of scientific management into plants in which you are interested, describing in general the system installed."

Mr. DODGE. Mr. Taylor, who was before you yesterday, and a Mr. White invented what is known as the Taylor-White steel. The Taylor-White steel, when used as a tool in a lathe, or on a planer, would do variously from 5 times to 20 times as much work as any of the then existing steels. I heard of this and went up to Bethlehem and saw it and bargained with the Bethlehem Steel Co. for the use of the Taylor-White steel. We were the first people that ever made a bargain with them at all.

We then got some of the steel, brought it to Philadelphia, and tried to use it on cast iron, and it was a failure. The steel that would cut almost the hardest known steel, like armor plate, would not cut cast iron. The reason was that the peculiar principle of Taylor-White steel, or high-speed steel, is its enormous strength when it is hot, and a tool made of that steel would take a peeling off of a piece of steel that was turning in the lathe the same as you would take a peeling off of an orange. Your fingers do not go into the place where the peel and the orange are united and cut them loose from each other, but they pry the outside layer off. That attribute of the Taylor-White steel, doing this wonderful work, would lead a person, naturally, to suppose that it would cut cast iron the same as it would a piece of cheese; but it appears that in cutting cast iron the tool has to go right in there and work on the particles of iron with its cutting edge.

I made some tools in Philadelphia for turning off big pieces of steel. One of them had four little steel balls in the end instead of a cutting edge, and the other had a little roller, and as long as we could keep those things lubricated it kept taking off a layer of steel on the outside. But it was a very difficult thing

to keep it lubricated, and as soon as you failed to keep it lubricated it was ruined. That shows the wonderful difference between cutting cast iron and a piece of steel. We started then a series of experiments, with the aid of Mr. Taylor, and a steel was developed that would do equally good work on cast iron. That cost a great deal of money and took a number of years. Just as soon as we saw that a lathe would do twice or three times as much work with the Taylor steel as it had done before, we realized that our old piece rates, our old methods of management, were not in harmony with this new development.

We found that the tools themselves—the lathes and the planers and everything we had—were too weak to properly use this high-speed steel. We rebuilt the tools that we could, and eventually we ordered new tools properly made for use. At that time, if we were going to buy a lathe, the salesman would come in and want to sell us lathes, and we would say, "How much power does your lathe take?" and if it was 5 horsepower, we would say, "How much does this other take?" That would be 4 horsepower, and we would buy the 4-horsepower lathe, because that was cheaper to run.

After Mr. Taylor, Mr. Barth, and Mr. Gantt began with their practical work, then when a man came in to sell us a lathe, we would say, "How much power can we safely transmit through your lathe to the cutting tool?" and the man that said the most, up to 50 or 60 horsepower, he was the man that we dealt with.

Now, there was a revolution in the tools of the trade. It was no revolution in the workmen; it was no revolution in the boss; it was simply a fact, the same as Maximite is better for some things than gunpowder. It required an adjustment of everything. So, then, we felt and knew that we would have to have management, accounting, and everything that goes with it, in our business, commensurate with this wonderful discovery.

Mr. Taylor had been working on this shop management—he called it the "art of management"—for a great many years; some 35 or 30 years ago he started, and about 15 years ago or so—12 or 15 years ago—he published a paper on the subject. We had known Mr. Taylor, and we knew the manner of man he was, and we immediately made up our minds that if we were going to have a shop that was thoroughly abreast of the times, we must have not only high-speed steel and the best tools and the best electric driving, which we were pioneers in putting in, in a sense, but we would have to have a commensurate management. So we asked Mr. Taylor what he could do for us. Mr. Taylor was not in active business. He was a man who had retired with a very handsome competence, and all made—all except what he got out of this high-speed steel—from his own ability as a manager in taking different concerns and managing them.

So he said that he could not do anything for us except in an advisory way. We said, "Well, what are we going to do now? We want this thing. We want all your experience here." He said, "Well, the best thing I can tell you to do is to engage Mr. Barth," and we engaged Mr. Barth in 1905.

Now, you see that is about 12 or 13 years ago. Mr. Barth came to our place, and he had been a student under Mr. Taylor, and he came there to tell us what to do. Mr. Barth, with frankness that is not usual, said that he was a student himself, and that if we were willing to let him come in our shop and try to do the things that Mr. Taylor talked about, he would undertake the job.

Almost the first day he was there my associates said to Mr. Barth, "What are you going to do for us?" He said, "I don't know. How can I tell until I get into it?" That was his answer. He said, "How can I tell?" That sounds as though we were foolish to engage Mr. Barth, but all the people who have known him, who knew him then and have known him since, know that that was a perfectly truthful answer. He did not know where he was coming out in that deal; but with Mr. Taylor's suggestions, and with some little bit of help, but with a great deal of hindrance, from us, at the end of four years—was it not, Barth?

Mr. BARTH. I was with you four and a half years, off and on.

Mr. DODGE. By the time he had been there four and a half years, and we had tried all we knew how to help him, Barth went to other fields and left us with what is still the Taylor system of management.

You see that has gone on for nearly 10 years. It was four years and a half that he was with us, and we have had it practically in full operation for six years. No other concern in the world has had that system in operation for a longer time than that. Mr. Taylor came to see us as often as he could. He was not

in very robust health. Mr. Barth has a fatherly eye over us, and we have followed out the principles that they inculcate.

Mr. THOMPSON. With regard to the second question, Mr. Dodge, how was the system received by the workmen?

Mr. DODGE. We never had any trouble from the workmen. I will tell you who we did have trouble from.

Mr. THOMPSON. Follow the questions down, and then you may explain.

Mr. DODGE. All right.

Mr. THOMPSON. What was the effect of the introduction of the system on the quantity of product?

Mr. DODGE. The product was very largely increased.

Mr. THOMPSON. To what extent? What percentage?

Mr. DODGE. Oh, I would not dare say that. In individual cases the product might be increased tenfold. In other cases it would be increased twofold. I suppose it would be safe to say that if we could have held all the conditions exactly alike, which is impossible, of course, we certainly would have turned out twice as much work as we did before; but we have no data on that, because there was no use in keeping records under a system that had been in vogue since the Pyramids had been built. Questions were never asked.

Mr. THOMPSON. You think it has paid, though, from the standpoint of production, well?

Mr. DODGE. Oh, absolutely paid; yes, sir.

Mr. THOMPSON. What was the effect on the quality of the product?

Mr. DODGE. It was very much improved, through more careful and scientific inspection and instruction of the men. They did not make mistakes.

Mr. THOMPSON. To what extent did the greater overhead charges for planning room, functional foremen, etc., offset the higher output per man? In other words, to what extent were the net profits of the concern increased, if you know?

Mr. DODGE. There are two questions in one there. In the first place, two years after Mr. Barth left us our overhead charge was no higher than it had been before. In other words, as soon as we learned enough of it, as Mr. Taylor and Mr. Barth had told us, to dare make changes, the overhead came down to where it ought to be.

As to the functional foremen, etc., that meant in the machine shop, apparently nine men, but Mr. Taylor told us, when he talked the matter over with us, he said, "Are you going to put nine men in there?" We said, "Yes." He said, "We can not stand that. How many men have you got now?" We said "We have got a foreman." There were two of the men that were detailed to help the foremen, and they were not recognized under the functional we had before, so that when we got through we had less supervision than we had under the old system.

Now, as to the increase of net profits, the net increase—the net profits—have never shown any great increase, because we have been able to sell our goods at a lower price and pay our men higher wages. The earnings of the concern have ranged—and all this is in the State reports in Pennsylvania, and so on—there has never been a fluctuation, not since the Taylor system went in, of over 2 per cent, and our net profits have been a little over 9 per cent on our sales.

Mr. THOMPSON. What has been the effect on the general health, the wage rates, and the earnings of the workmen?

Mr. DODGE. The effect on the wage rates has been a very substantial increase in wages. I have here the record of the workmen's time and earnings; the records of some of our men who have been with us ever since the Taylor system was introduced. Here is one, Walter M. Megargee. I read this almost at random. In March, 1913, his day's rate was 38 cents per hour. Now we have got a column here "Average number of hours work," by this same man. Mind you, 38 cents was his rate per hour, if he worked at straight daywork. His actual wages were 62.1, 71, 66, 76, 61, 74, 71, 59, 68, 67. In other words, by the week, if he had worked 54 hours, he would have made a little over \$16, and, as a matter of fact, he got \$38, \$37, \$33, \$33, \$40, \$38, \$31. I do not mean to say that they are all as good as that; but that only shows the way it goes.

Now, that is for 1913. In 1911 his earnings—total weekly earnings—were \$15, \$25, \$26, \$22, \$26, \$27, \$27, \$24, \$26, \$24, \$17, \$23, and so on.

Now, here is the record of the same man in 1911, 1909, and 1908. Let us see how far back this goes. Here is his record for 1907.

In 1907 his total weekly earnings were—oh, in 1907 we had the slump. The man's time was reduced, and he worked 35 hours a week for July, August, and

September, and then he went up to 38. At 35 hours per week, the full week being 54 hours, he made \$15, \$10, \$17, \$18, \$15, \$13, \$13, \$15, and so on. That was during the slump in 1907. We shortened hands there by reducing the time.

Mr. THOMPSON. Have you any objection to introducing those schedules into the record?

Mr. DODGE. I will tell you the difficulty is that these are the original records in daily use; but I can send you photographic copies of any of them.

Mr. THOMPSON. Will you do that?

Mr. DODGE. I will. I do not know whether you would like to have all of them or not. Here we are lapping over onto the question of health.

Morris Marshall is now foreman of our planning room. He worked on the lathe. There is a notation here which I made yesterday that says that he weighs 105 pounds, is 5 feet 2½ inches high, and the time he worked in the shop was eight years. During this time he never lost a day from sickness or injury. He operated a lathe with a 28-inch swing, 24 feet between centers, shafting, axles, and so forth. His health was better in the shop than in the office. He complained of the confinement of the office work, but he had good health while he was in the shop.

Now, I want to show you some things here that may be interesting. I want to get that question right; I do not want to get away from the question. Well, I have answered about the facts of the wage rate and the earnings and this general health.

Mr. THOMPSON. Mr. Dodge, your question is with regard to the individual man. Is that typical of the rest of the men?

Mr. DODGE. I have picked out men running gear cutters, and men on the floor, and on the bench, and setting up, and men running a large boring mill, and lathe hands, and another lathe hand, and another lathe hand, and men working on radial drill presses, and on a planer, and general machine hands, and so forth.

Mr. THOMPSON. Will you furnish us with copies of those records?

Mr. DODGE. Yes.

Mr. THOMPSON. Is the condition with reference to the wages shown in these schedules typical of the rest of the employees who have worked in your shops?

Mr. DODGE. It is, because it could not possibly be otherwise; everything that is down in these records is done after a proper time study, and consequently it must come out with the same result.

Mr. THOMPSON. Then these schedules are not schedules of men who have more than ordinary ability in their line of work?

Mr. DODGE. Of course, when we introduced the Taylor system we were running quite a large shop, and these men were working under the old system, and the same men are practically with us yet. In other words, we have not selected men, although some of them have left, but the average term of employment in our shop for all of our men is nearly eight years.

Mr. THOMPSON. Is what you say with reference to the health of the men in the planning room true generally of the employees in your establishment?

Mr. DODGE. I could tell that better by giving you this one little sheet of data. We have a beneficial society, and the number enrolled in 1911 was 454; in 1912, 431; in 1913, 477; in 1914, 471. Of course, that record is only for three years. Total time lost during the year, from sickness or injury, 380 weeks in 1911, or 1.6 per cent of the number of weeks.

You see, the number of weeks that these men would work in a year, if they worked a full year, that would be 1.26, so that there was 1.6 time lost by employees in 1911, 1.10 in 1912, 1 per cent in 1913, and 1914 has not gone far enough.

Time lost by shopmen by sickness—this makes the distinction—122 weeks for shopmen, or 1.2; in 1912, 137 weeks, or 1.5 per cent; in 1913, 146 weeks, or 1.4 per cent.

Time lost by men not in the shop from sickness or injury, 258 weeks, or 1.9 per cent, as opposed to 1.2 for the shopmen—115 weeks in 1912, or 0.8 of 1 per cent, as against 1.5 per cent for the shopmen; in 1913, 1.25 per cent of the shopmen and one-half of 1 per cent of the office men. So you see there is no rule indicated there. It is a little bit in favor, however, of the shopmen, but I think that is because they have better digestion.

Mr. THOMPSON. In your opinion, Mr. Dodge, would the continuance of these men at work under this system shorten their working life?

Mr. DODGE. Absolutely no.

Mr. THOMPSON. Referring to question No. 7, what changes have been made in the working hours, and was this directly due to the change in the system of management?

Mr. DODGE. No; the change was in name. We used 54.2 and we used to work 60 hours under the old system, and we used to work 10 hours a day, but that again was not made on account of a system of philanthropy or anything else, but through dividing up better, and to make easier bookkeeping and time keeping, to work 54.2 hours a week.

Mr. THOMPSON. Then, the main advantage to the men is the gain in increased wages?

Mr. DODGE. And less exertion; increased wages and less exertion.

Mr. THOMPSON. What effect, if any, has it had on the number of men employed?

Mr. DODGE. I do not know how to answer that exactly. I think our business has increased because we were able to get more contracts than some of our competitors, because we were doing fine work and we were selling cheaper than the other fellow.

Now, you see, from 1911 to 1914 it is 454, 431, 447, and 471 men. These differences I can not especially account for, except that business was good in 1913; just now it is falling off like smoke.

Mr. THOMPSON. What effect has it had on the grade and qualifications of the men employed and on the proportion of skilled and unskilled workmen?

Mr. DODGE. We have no record of that. We could dig that out, but we are not conscious that the shops look any different from what they did. We are not conscious that there is any great change. You see the work is about the same thing.

Mr. THOMPSON. What effect, if any, has it had on the regularity of operation of the factory?

Mr. DODGE. Well, our reports show, from the beneficial society—if I had known I was to be asked that question, I would have gone back of this—but our records show that the men in the shop have been in better health under the system than they were without it.

Mr. THOMPSON. That question also includes question No. 6; what effect on the regularity of the workmen.

Mr. DODGE. I think it has had a very beneficial effect on the regularity of the workmen, but I can not differentiate between the system and giving filtered water, the beneficial society before we had the system, and before we filtered the water and cooled it without direct contact with the ice, they showed stomach troubles all through the spring, summer, and fall, they were the principal causes of men not coming to work, and after we filtered the water we thought it was the greatest benefit of all. The system has got nothing whatever to do with that, unless our men were dropping dead by the wayside, and they do not do that; they are very, very regular.

Mr. THOMPSON. Are there many complaints from the workmen of the fact that they are compelled under the system to work too hard?

Mr. DODGE. We only have one form of complaint in our shop to-day, and that is that we have to keep the men on daywork longer than they think we ought to. In other words, the struggle in our shop is to come under the system and under the bonus method of payment, under the task.

Mr. THOMPSON. What effect has the system had on the length of time the workmen will remain in the employment of the company?

Mr. DODGE. As I say, I took all of our men, the whole bunch of them, through; I asked our timekeeper this question. I asked him, "How long do the men work?" And he said—this is his report to me as the boss—"We have gone over the length of time that each man has been employed in our machine shop, and we find the average length of time to be better than seven years." Now, I will challenge any shop in the United States to equal that record, that does not have scientific management.

Mr. THOMPSON. In other words, you consider that a good record of length of service?

Mr. DODGE. I think it is wonderful. You go around in our shop and ask the men how long they have been there, and you will find that they have been there 15, 20, or 25 years. Of course we have men come and go. That will happen, I do not care, at the very best of times, that they will move away, perhaps from sickness, or their wives will be sick, or something like that, but that is doing pretty well.

Mr. THOMPSON. I will ask whether the functions of the employee are more universal, more specialized than before?

Mr. DODGE. We do not do competitive work in our shops, and we have to develop all-around workers, and we frequently change men from a lathe to a boring mill, or from a boring mill to a drill press, or something like that, so as to have them ambidextrous, so that when we want men to stick in on one thing we have got them. We do not need specialists. Specialists are detrimental to a shop. Of course that may be so in a chewing gum factory, or something like that, but we do not need them in our company.

Mr. THOMPSON. Then men leaving your shop would have better chances elsewhere than without the system?

Mr. DODGE. Yes; we find that other people hire them right away, make it more attractive to them, but there is no trouble about that.

Mr. THOMPSON. You mean when they leave it is not on account of the system?

Mr. DODGE. No; I have not in mind any case where we had to let a man go on account of the system.

Mr. THOMPSON. Does it increase the employee's interest in his work?

Mr. DODGE. Certainly it does, because it increases his compensation, and he has a better time, and he has no disciplinarian, he has nobody swearing at him, and he can go jogging along, and he does his work and makes his money and is satisfied.

Mr. THOMPSON. That is a nice way to die.

Mr. DODGE. That is the way they die, most of them; in the first place we will make them happy when they are ready to die.

Mr. THOMPSON. In times of depression what class of men—are they all-round mechanics or not that are likely to be laid off, so far as you know?

Mr. DODGE. We lay off the ones we have not the work for; it is not a matter of class at all. In the first place we reduce hours as much as we can, and if men have to go, why naturally the ones that were the least competent would be dropped out. But it sometimes happens that we have run out of work in certain classes, and then, of course, they suffer the most, but any man that is laid off that way is given the first opportunity to come back. We never fill a man's job with somebody else.

Mr. THOMPSON. What provisions are there in your company for the training of apprentices?

Mr. DODGE. We have a standing order with the Williamson Free School of the Mechanics' Trades, and we get as many as we can, but unfortunately the Pennsylvania Railroad competes with us, and some others, and we are very lucky if we can get three boys a year out of their classes. They are taught trades, they are not taught to be engineers or draftsmen, they are taught to be workmen, and we have had as many as we can get of them for a number of years, and I am glad to say that we have never had one of those boys disappoint us. They have all turned out well. The majority of them are either foremen in our establishment or in other establishments.

Mr. THOMPSON. Where is that school located?

Mr. DODGE. Near Media, Pa.

Mr. THOMPSON. What are your relations with the employees, and how are they adjusted in case of difficulty?

Mr. DODGE. Well, my personal relations with my employees come pretty nearly to the point of their calling me Jim instead of Mr. Dodge; I call them by their first names, and I try to remember them. My door is always open to everybody in our establishment.

Mr. THOMPSON. Then you have no special machinery for the adjustment of difficulties if they ever arise?

Mr. DODGE. I do not have that, except where a man complains that he is not doing enough work other than daywork; that is the great difficulty.

Mr. THOMPSON. That is all, if the chairman please.

Commissioner O'CONNELL. You say that the Taylor system you have had in operation about six years?

Mr. DODGE. Yes.

Commissioner O'CONNELL. That would be from about 1908?

Mr. DODGE. Well, Mr. Barth went away in 1908.

Commissioner O'CONNELL. Well, it doesn't matter.

Mr. BARTH. I went away—I don't know just when I went away, but I think early in January of 1908.

Mr. DODGE. Well, let us say six years. We began getting the men under the Taylor system long before Mr. Barth went, because we would not let him go unless we had squeezed him pretty dry, and there were other people after him all the time.

Mr. THOMPSON. In 1908 what were the hours of labor?

Mr. DODGE. I think they were about the same.

Mr. BARTH. About the same, 54.2

Commissioner O'CONNELL. Was that in the Philadelphia shop or all the shops?

Mr. DODGE. The Philadelphia shop. We did not put it in Chicago for two years afterwards. It took us four years and a little more to introduce it in Philadelphia, but it took us only about a year to make the same progress in Chicago because we had the same experience.

Commissioner O'CONNELL. Is 54 hours about the regular hours of labor in the machine shops in Philadelphia?

Mr. DODGE. As far as I know; there may be some exceptions, but I am not conscious of it.

Commissioner O'CONNELL. The Saturday half holiday has been recognized for many years?

Mr. DODGE. Yes.

Commissioner O'CONNELL. It is not a new thing at all in Philadelphia.

Mr. DODGE. No.

Commissioner O'CONNELL. It is an old custom, is it?

Mr. DODGE. Yes.

Commissioner O'CONNELL. So that since the introduction of the Taylor system the hours of labor have not been reduced?

Mr. DODGE. No.

Commissioner O'CONNELL. And if they were it would have nothing to do with the system. The same rules now prevail in the Chicago shop?

Mr. DODGE. Yes.

Commissioner O'CONNELL. Have you ever had any strikes in the shop since the system?

Mr. DODGE. We have never had the slightest trouble since we introduced scientific management. Our Chicago shop was raided three times, men were knocked out in the shop, windows were broken, and machinery was broken, and things of that kind, and we have had mobs go through the Chicago shops three times, but we never had any trouble.

Commissioner O'CONNELL. And at Indianapolis?

Mr. DODGE. In Indianapolis we never had the slightest trouble at any time. And in Philadelphia we have never had any labor trouble.

Commissioner O'CONNELL. Have the unions been in any way recognized or dealt with in any of the shops?

Mr. DODGE. No, sir.

Commissioner O'CONNELL. Never in the Chicago shops?

Mr. DODGE. Before the system was put in we tried to deal with the unions, and we had riots there.

Commissioner O'CONNELL. There is no method of collective bargaining between the men and your company?

Mr. DODGE. No.

Commissioner O'CONNELL. The company sets the standard of wage upon which wage the bonus is based?

Mr. DODGE. Yes; with the cooperation of the men.

Commissioner O'CONNELL. Are the men taken into consultation?

Mr. DODGE. They have to be; every time a time study is made it requires two people—the man that is taking the time and the man that is doing the work.

Commissioner O'CONNELL. The man who is doing the work is simply part of the machine, as it were?

Mr. DODGE. As much as any workman in our shop that the time-study man goes to. It is not one man that goes around and does all these stunts; he goes to first one man and then to another, so that every man in our shop has had these time studies made on him maybe 50 times; we have on file now maybe 50,000 time studies.

Commissioner O'CONNELL. Suppose you make a time study of a man and you set up the conditions under which he operates a lathe, for instance, turning shafts in a lathe; you set a time for the turning of those shafts?

Mr. DODGE. Yes.

Commissioner O'CONNELL. And after you have agreed with your expert that such and such is the proper time that such work can be done in, and the workman says, "No, it can not be done in that time," what is the result?

Mr. DODGE. We bring a man in there to show him that it can be done.

Commissioner O'CONNELL. And if he still disagrees with you?

Mr. DODGE. You do not mean to say that he will disagree after he has been shown that the thing can be done?

Commissioner O'CONNELL. I am afraid I do; yes.

Mr. DODGE. If I say two and two is four and a man disagrees with me, and I bring a mathematician or a professor to tell him so, and show him in every way that I can that it is so, and he still disagrees, he is hopeless.

Commissioner O'CONNELL. But you know what some men can say and what they can do with figures, and what other men can do with figures. The fact is that the employer sees that the employee, in so far as the time-study man comes to him—he uses him as a means of working out a time study?

Mr. DODGE. Yes.

Commissioner O'CONNELL. That is the only way in his interest in which he is consulted?

Mr. DODGE. Yes.

Commissioner O'CONNELL. And he is in no other way in that matter at all?

Mr. DODGE. Yes.

Commissioner O'CONNELL. He has no other say in the matter at all?

Mr. DODGE. Yes, he has. He can say that it is not right, and we will keep at it until we convince him, if it is a possible thing. There is no arbitrary idea of forcing a man. In that connection I could show you some diaries of our men that were in use up to the day before yesterday, in which the man kept records of the time required for a particular job, and all the particulars of it. I did not know much about it before, but I found lots of them were doing that, and here are the books; and if somebody, after we are all gone, was to try to put it over those men with the same kind of a job at a lower rate, he has his record as to what he did it in before, and he would bring that in and say: "The last time I did that, it required so much time." And he is entitled to an explanation, and he gets it. And if there is an error, it is corrected. If the thing has been improved, that is taken into consideration. For instance, suppose a man had a record of the work that he did with the old-fashioned carbon steel, and then we introduced the high-speed steel, which does from 4 to 40 times as much work. In that case the old time record, as you well know, would be valueless, and he would recognize it, and submit to a readjustment of the rate, due to the fact that we had got better tools for him to work with. That is always recognized.

Commissioner O'CONNELL. A very large percentage of the increase of output was first brought about by the introduction of high-speed steel?

Mr. DODGE. I should say yes, probably that was the greatest opportunity that we had, and new tools to go with it.

Commissioner O'CONNELL. And with that, the introduction of new tools, electric driven tools, and all these appliances that go to make things speed up?

Mr. DODGE. Yes.

Commissioner O'CONNELL. So that the great saving in the time of production, and the great increase in production, is not because the workmen per se soldiered to that extent under the former condition?

Mr. DODGE. Oh, no.

Commissioner O'CONNELL. It seems to be the idea of some that we have discussed this question with that the workman has been the great soldierier in that proposition. They do not seem to see that there are other conditions surrounding his former employment which had a very important bearing upon the question, and that, although he may have worked under the most laborious conditions, yet he could not produce anything like what he can under the improved conditions.

Mr. DODGE. That is very true.

Commissioner O'CONNELL. So that it is not the employee who has been the soldier—the workman?

Mr. DODGE. No; not at all. I do not agree with that idea at all.

Commissioner O'CONNELL. Do you believe, Mr. Dodge, that there is a possibility that the employees might be organized into a form of an organization under which they could cooperate with the employers, with a view of meeting them on a common basis, at a round table, as it were, for the purpose of discussing all these various matters?

Mr. DODGE. I think it would be most desirable; yes. The point is this, in regard to this matter of time study: If I come to you, or any one of you gentlemen, and say, "Come over here with me and help me do this thing"; and sup-

pose a certain thing when it is added up comes out at one minute. That is not a matter of arbitration, that is a matter of fact. It is not any more a matter of arbitration than if I should say to you, "Come over here, I want to show you the multiplication table," and you should come over and look it over and say, "We will arbitrate it."

Commissioner O'CONNELL. But suppose I should say to you that I am now getting \$4 a day and I should get \$5 a day. Is not that a question for arbitration?

Mr. DODGE. I don't know whether it is or not. If I felt that I was not paying the man enough and I was grinding him down, I think I would take very serious heed to that proposition personally, and I should say that it would be a case or a matter for arbitration.

Commissioner O'CONNELL. Suppose, collectively, the employees should say to your Link Belt Co., "We believe that we ought to have an increase of 10 or 20 per cent over the rates we are now enjoying." Do you think that would be a question for conciliation or mediation or arbitration?

Mr. DODGE. It depends on how much of a hole they were pushing us into. If we felt that we could not do that without jeopardizing our business or bankrupting ourselves or doing ourselves serious injury, we would fight it as long as we could and then give in gracefully. As Bob Ingersoll used to say, "If you have only one dollar in the world and you have to spend it, spend it like a lord." That is what we do.

Commissioner O'CONNELL. In that case, I think the Link Belt Co. ought to be a leader in the matter of shortening hours, if they are getting this great increase in production over other firms that are not. Don't you think they ought to pave the way, so to speak?

Mr. DODGE. Very likely, from your point of view. Very likely, if you were one of us and were down there working along and saw the men happy and the men wanting to work that long and make the wages they can, and not wanting the time reduced, I think you would say, "Let them work."

Commissioner O'CONNELL. That is all.

Mr. DODGE. I would volunteer one more thing about the cooperation of the unions with scientific management.

Commissioner DELANO. Mr. Dodge, it is one of the objects of this commission to try to discover some common ground upon which we can all meet in settling this question, and it has been stated—you perhaps heard it yesterday—

Mr. DODGE. I was not here yesterday.

Commissioner DELANO. Well, it was stated here yesterday that, as a fundamental economic truth, it was impossible for the workingmen to improve their condition, either in wages or other working conditions, unless there was an improvement in efficiency; that is to say, an increment in the actual per capita output. Do you believe that to be true?

Mr. DODGE. Yes; I do. I believe that is so. I believe that it is a truism; that a man that makes two blades of grass grow where only one grew before is a benefactor of his race; that a man who makes two books grow where only one grew before is a benefactor of his race.

Commissioner DELANO. Do you carry it to the point of saying that unless something like that is accomplished the workingman can not expect a greater remuneration or better working conditions?

Mr. DODGE. I am not prepared to say. I do not know where the breaking point is. I am not prepared to say that if we were to increase our men's wages 10 per cent that of necessity we would go into bankruptcy. We would scratch like thunder to meet that situation and do the best we could; and we might keep off unprofitable lines, or we might do something—I don't know what; but we certainly would fight hard. I do believe, however, that the very minute that the labor unions will become interested in the efficiency of their members more than in the loyalty of their members—that is all right, but let it be secondary—that that would be a tremendous step in advance. I also believe this, that whereas we have had the relations between organized labor and employers, without any system whatsoever, simply guesswork—coming in to the foreman and saying, "How much can that be made for?" and he looks wise and turns it over and says, "It should be made for 10 cents."

Now, I was a party to that for a great many years, and I worked under the piece rate, and I cut the piece rate; and we made mistakes, and the way we adjusted them was to take it out of the hide of the workmen. We would say, "That should be made for 10 cents," and the man would make six of them in the time when we thought he could only make three, and we would

reduce the price to 5 cents; and if he got up and got his head above water again, we would hit him again, just as far as we could. I have been all through that matter, and that is the pernicious part of piecework.

Under the present system, when that job comes into our shop, we do not look back and see when we made a book like this, for instance, but we analyze the things that go into the making of that book, labor and time and everything that goes into it, and we look for analogies in the records that we already have; so that, even though this is the first time for this job, we are able to make a very good estimate of what it is going to cost, and we can set a rate which, ninety-nine times out of a hundred, the workman accepts; and that is where the difference is. What we want, and what the unions could insist upon, is the absolute elimination of guesswork. There is something that we could agree on; and if any gentlemen connected with the labor organizations, the heads of them—the higher up the better—will make a study of how to harmonize the scientific management with unionism, they will find the heartiest kind of cooperation; but so long as the attitude is that scientific management must harmonize itself with unionism, it is going to be hard sledding. It is a mutual proposition. The labor organizations would be welcomed by any people who have scientific management to see what adjustments can be made. All they want to do, both sides, is to insist upon seeing that justice is done; and the union can be just as potent in striking or resisting an unfair employer under scientific management, provided they favor scientific management, as they can in resisting the unfair employer now, with no system whatsoever.

So that I do not consider that the things are incompatible at all. However, it must be a mutual coming together. I predict that before many years the unions will insist upon scientific management, and see to it that it is done fairly and squarely and scientifically; and the minute that comes, there will be an end to labor disputes. There will not be an end to the unions, because there is plenty for the unions to do.

The CHAIRMAN. Mr. Weinstock, do you wish to ask any questions?

Commissioner WEINSTOCK. Yes.

You stated, Mr. Dodge, that under the old piecework system, when the worker was earning too much, you would cut the price?

Mr. DODGE. Yes.

Commissioner WEINSTOCK. In this little book that you have here, belonging to one of your men, there are notes of the time studies. One of the notes says:

"I made a barrel of money on this rate. Brown said I didn't do it honestly; but I offered to bet him twelve dollars to five that I could still go ahead of that. But he got cold feet."

In view of his having made "a barrel of money" under these circumstances, was the rate cut?

Mr. DODGE. No.

Commissioner WEINSTOCK. It was not cut?

Mr. DODGE. No.

Commissioner WEINSTOCK. He was allowed to go on making "a barrel of money"?

Mr. DODGE. We would not dare to cut the rate. Scientific management would evaporate like snow in sunshine if we did not keep our word with our men.

Commissioner WEINSTOCK. You stated, also, that since the introduction of the system the net earnings of the business have not increased to speak of?

Mr. DODGE. The gross earnings have.

Commissioner WEINSTOCK. But not the net?

Mr. DODGE. The net earnings have fluctuated about 2 per cent on the sales; but we have been able to sell our goods cheaper and to get a larger share of the trade.

Commissioner WEINSTOCK. If you have gotten a larger volume of business on the same net earnings, your surplus for distribution ought to have been larger than under the old conditions?

Mr. DODGE. Look at these statements here yourself, and see what the surplus is—from 25 to 60 per cent, right straight along here.

Commissioner WEINSTOCK. Then, when you said "net," you meant the rate—

Mr. DODGE. No. We make a report to Harrisburg every year, telling everything that has gone on in our business.

Commissioner WEINSTOCK. I am afraid I have not made myself plain. I mean, have your stockholders reaped any larger dividends than they did under the old conditions?

Mr. DODGE. They have done this; we have had a larger volume of business, and our dividends have been practically constant, except in some hard spells. Our dividends have never exceeded 12 per cent, and I do not remember that they ever went below 9 per cent. I would just as soon not have that published, because I am not entitled to tell that, you know.

Commissioner WEINSTOCK. This is my point: If I were a stockholder in your enterprise, I would then be in a position to come to you and say this: "While this new system has evidently been of some advantage to labor, it has been of no advantage to me as a stockholder, because my dividends are no larger to-day than they were before." What would be your answer to that?

Mr. DODGE. My answer to that is this, that the dividends have been larger. The largest that I know of, or remember of, is 2 per cent larger, and to that extent it is a great advantage. Furthermore, we have established a stability in our business that we were never able to establish before.

Commissioner WEINSTOCK. You mean that the chance for losing is minimized, because your labor is better satisfied?

Mr. DODGE. Yes. We do better work and fill our orders more quickly. If I were to ask the president of our company what the greatest benefit derived from scientific management was, he would say "Prompt shipments. Keeping our promises." I might say that now, in our shipments, when promises are made, we run all the time over 86 per cent that we ship on the day we promise to ship; and I remember the time very well when it was 86 per cent of the time that we did not ship on the day that we promised. That is a big asset in business.

Commissioner WEINSTOCK. Prompt shipments?

Mr. DODGE. Yes. I tell you it is a big asset.

Commissioner WEINSTOCK. It gives you a better grip on your trade?

Mr. DODGE. It surely does.

Commissioner WEINSTOCK. Unionists have expressed the opinion that they more or less fear scientific management because it is a menace to unionism. Has not your experience demonstrated the fact that it is a menace to unionism, in that your plant is not organized, when it formerly was organized?

Mr. DODGE. Until they come together, the union and scientific management, making a study of scientific management, it is a menace. Our men do not see any reason why they should pay dues to a union to insure them less wages than they are getting now. Our wages run right along and are above the union rates. I can not help but feel—it is a personal matter with me, and I do not want to explain it as a political economist; but I know this—that if we can make 1,000 workmen enthusiastic about scientific management I will guarantee to make 100 labor leaders as equally enthusiastic if they will give me the same chance.

Commissioner WEINSTOCK. Take it in your own plant, Mr. Dodge. Do you ask applicants for jobs whether they are unionists or not?

Mr. DODGE. No, sir.

Commissioner WEINSTOCK. You ask them no questions?

Mr. DODGE. We do not care a rap.

Commissioner WEINSTOCK. Have any efforts been made in your plant since you introduced the system to unionize the shops?

Mr. DODGE. Not that we know of. We haven't any watchman, except the watchman at the gate, and we have a sign up, "Visitors always welcome."

Commissioner WEINSTOCK. If an effort was made to unionize your shops would you resist it?

Mr. DODGE. I should say, as it is now organized, that I would; but if a union leader were to come to me and say: "Will you allow me to stay here for a month, until I acquire what little knowledge I can of your system, and if I am convinced that it is all right I will meet you in the spirit of scientific management," we would throw the doors open and say "You are welcome."

Commissioner WEINSTOCK. Then you have objected to efforts being made to unionize your shop, because you feared, I take it, that if it was unionized they would fight the bonus system?

Mr. DODGE. No. I will tell you. I might say this: Our shop in Philadelphia had a machinists' union in it, and it disbanded. I don't know exactly when, but I could find out. It voluntarily disbanded some little time after Mr. Barth came there. The shop in Chicago having been raided, we had the dickens of an old time there. We were obliged to have an open shop and say so. We have said so, and we have maintained an open shop, and it is a happy shop, and we

have no trouble to get men, and we do not ask any questions there as to whether they are union men or not.

The whole thing in a nutshell is this: I think the unions are fighting something that they have not thoroughly investigated.

Commissioner GARRETSON. I just want to ask you one question, Mr. Dodge. This question has been asked before, in a little different form, but I want to bring out another phase of it. It is laid down as a fundamental proposition that the condition of the workmen could not be bettered unless the output was increased. Assuming, for the moment, that that is a truism, would it not also be a farce if it was applied where the corporation that was the employer was declaring dividends of 45 per cent as against another corporation, and a competitor of it, that was declaring dividends of 5 per cent?

Mr. DODGE. I should say that if I was the fellow that was getting 5 per cent, I would be so mad that I would go out and bite nails, and I would not stand for it.

Commissioner GARRETSON. Would it not be absurd to apply it as a truism to the two conditions?

Mr. DODGE. Certainly. I think our friend Ford has got a soft snap.

Commissioner GARRETSON. You do not recognize the same fundamental principles—

Mr. DODGE. No. If we were to follow in Ford's footsteps, it would be a different proposition.

Commissioner GARRETSON. The reason why he is able to do as he has done is because so many people do follow in his footsteps, or tire prints?

Mr. DODGE. Yes. I had that all written out, but you did not ask me about it, so that I am not going to squelch him. I had something rather interesting about that. The truth is that our earnings per man have ranged from 25 cents to \$1 through a long term of years and Ford's earnings were \$5.46. If we had \$5.46 per man to play with, I would give you a lot of it, and everybody else.

Commissioner GARRETSON. Then, I am sure that I wish you had it.

That is all.

Mr. DODGE. It has been suggested to me that a number of the members of your commission have visited our plants, and I wish to say that we would be delighted to entertain the whole commission, either individually, separately, or in a bunch, or any other way.

The CHAIRMAN. Thank you.

TESTIMONY OF MR. P. J. CONLON.

Mr. THOMPSON. Mr. Conlon, please give your name and residence to the reporter.

Mr. CONLON. P. J. Conlon, Mount Ida, Va.

Mr. THOMPSON. What is your occupation?

Mr. CONLON. I am international vice president of the International Association of Machinists.

Mr. THOMPSON. The subject that we have up for consideration at this hearing is the subject of efficiency systems and labor. What contact have you had with any such systems of shop management?

Mr. CONLON. I have had some contact with what is known as the standard time system and the Vicar-Maxon system, the piece-rate system, and the Taylor system—a modified form of the Vicar-Maxon system.

Mr. THOMPSON. That is the system in force in England?

Mr. CONLON. Yes, sir.

Mr. THOMPSON. What is the general attitude, if there is any, of your organization on scientific management?

Mr. CONLON. The best answer I could give you to that would be to read an extract from our laws.

Mr. THOMPSON. You may do that.

Mr. CONLON (reading):

"This association stands for the abolition of the operation of more than one machine, piece-rate premium, merit, task, or contract systems. Members who may be found guilty of agitating or encouraging any of these systems in shops where it is not in operation are liable to expulsion; and the practice in such shops shall be entirely abolished as soon as possible, the date to be set by the general executive board."

Mr. THOMPSON. If I understand that correctly, that would prevent your men from working under the Taylor system?

Mr. CONLON. Yes.

Mr. THOMPSON. Or any bonus system?

Mr. CONLON. Yes.

Mr. THOMPSON. Or any task system?

Mr. CONLON. Yes.

Mr. THOMPSON. Upon what is the position of your organization based? Just state it briefly.

Mr. CONLON. On the daywork basis of compensation, with generous supervision, and the taking of the employee into consideration in the matter of collective bargaining or trade agreements.

Mr. THOMPSON. What, specifically, is the objection of your organization to the bonus system or the task system in the shop?

Mr. CONLON. We have several objections. The first is that it requires a task that is always increasing in intensity. The second is that the so-called efficiency systems have been devised solely in the interest of increasing dividends and with but little regard for the employee. Third, because we know that the overhead charge of accounting must be directly borne by the producer. Fourth, that the stimulation held out is deceptive and will disappear entirely as soon as the maximum task is established and standardized. We object because there is no margin left to take into consideration the increased cost of living year after year, except that which is actually forced by competition and losing the employee. The employee is not taken into consideration in setting prices; they are arbitrarily set by the efficiency engineers, who arrogate to themselves the terms upon which the employee shall work. We believe it is an effort to standardize men and conditions—an impossible task, and unscientific in the very nature of it. It is an attempt to subordinate the mechanical initiative to others, whether they have better methods or not; and the workman is simply an automaton, and loses his mechanical identity. We consider the establishment of these systems a confession of gross mismanagement on the part of the supervising force. Successful plants do not have to resort to these systems. Lastly, we believe that it builds up in the industrial world the principle of sabotage, syndicalism, passive resistance, based on economic determinism. We did not hear of any of these things until we heard of scientific management and new methods of production. The last few years we hear considerable about them.

Mr. THOMPSON. Have you a list of these points?

Mr. CONLON. Yes.

Mr. THOMPSON. A list in typewriting of the points you have read off?

Mr. CONLON. I have not got them in typewriting. I have a list.

Mr. THOMPSON. Would you mind letting me have that list?

Mr. CONLON. No. You may have it [handing list to Mr. Thompson].

Mr. THOMPSON. Taking up first the last subject you named, Mr. Conlon, what is the basis for your statement that efficiency systems, so-called, have caused sabotage, other than the mere fact that we have just lately been talking about efficiency systems and just lately in this country been talking about sabotage?

Mr. CONLON. Because they have come to the surface about the same time; and we find that when men can not help themselves, nor can they get any redress of grievances, and are forced to accept that which is thrust upon them, that they are going to find within themselves a means of redress that can find expression in no other way than passive resistance or in syndicalism.

Mr. THOMPSON. Is that the only connection which you have stated upon which you base that statement?

Mr. CONLON. Yes, sir.

Mr. THOMPSON. Then the appearance, in your opinion, of two things in our civilization substantially at the same time would be all that you would require for the deduction that they grow out of each other or are related to each other?

Mr. CONLON. They both break out in the industrial world at the same time. If there was no correlation of these two things appearing simultaneously, we might not make that deduction.

Mr. THOMPSON. But I have stated the correlation in this case is that of contemporaneous appearance. I do not understand you to give or show any other reason why these two are connected.

Mr. CONLON. I do not catch your question.

Mr. THOMPSON. I say I have not understood you to give any other reason for the connection of these two—sabotage and efficiency systems—other than their contemporary appearance in our life.

Mr. CONLON. Yes, sir.

Mr. THOMPSON. That is the only reason?

Mr. CONLON. Yes; the exploitation through industrial papers of the fact that large concerns were discriminating against industrialists who had reached the age of 35 years, and imposed maximum tasks at a minimum age throughout the country, which led people to seek for a means of taking life easy through passive resistance.

Mr. THOMPSON. How do you connect these last two statements with the scientific management system and with sabotage?

Mr. CONLON. Well, as an illustration, if a body of men during a depressed time have suddenly thrust upon them the alternative of being in enforced idleness, or of accepting an efficiency system that they have no voice in, either in the prices or making, they will take it as the less of the two evils; but in taking it they are going to doggedly resist its successful operation in that shop.

Mr. THOMPSON. Can you give us any specific instance of the use of sabotage upon the introduction of an efficiency system?

Mr. CONLON. No.

Mr. THOMPSON. Then, this idea is simply a matter of theory with you, is it not?

Mr. CONLON. Not exactly.

Mr. THOMPSON. Name any fact upon which you make that deduction.

Mr. CONLON. The specific instance that I have in mind at the present time is that of the American Locomotive Works, in 1907, when the standard time was in operation there. The men struck against its extension. I tried to adjust the strike, and failed. I went back and told them of my failure to get the strike adjusted. They made up their minds during the panic of 1907 that they would go back into the shop, but that they would not try to make any bonus, and they did not, and in order to see whether they were sincere in their statement that they would not try to make any bonus, I picked up some 38 pay envelopes at the yard gate one pay day, and there were only \$2 and some cents bonus out of \$550 of earnings in the envelopes.

Mr. THOMPSON. Personally I can not see the connection with that last statement you made and this thing we call sabotage. What do you understand by "sabotage," and wherein does that statement bear upon that matter?

Mr. CONLON. Sabotage is where men see that there is no hope of redress at all, and they will finally try to ruin the business of the employer.

Mr. THOMPSON. I did not get the last part of your answer.

Mr. CONLON. I say they will eventually try to ruin the business of the employer.

Mr. THOMPSON. Then, the sabotage that you mean is that the men limited their output to their daily wage?

Mr. CONLON. Yes.

Mr. THOMPSON. Is that the only instance of the use of sabotage by the men as a reprisal or defense against an efficiency system that you know of?

Mr. CONLON. I think you are getting crossed on sabotage. I do not call that sabotage. I call that passive resistance.

Mr. THOMPSON. I asked you for cases that you knew of where sabotage was used upon the introduction of efficiency systems.

Mr. CONLON. I misunderstood you upon the question of sabotage. Passive resistance is getting along the best it can on that basis.

Mr. THOMPSON. Then, when I used the word "sabotage" you understood me to mean passive resistance to the employer?

Mr. CONLON. No; I think there is a difference between sabotage and passive resistance. Sabotage means that the men have made up their minds that they are going to destroy the business or in some way ruin the employer unless he comes to their way of thinking. I am not as well posted on that as I ought to be, because I do not believe in that line of industrial thought; but I do know that it is very prevalent in the case of the Industrial Workers of the World, a rival organization to the American Federation of Labor.

Mr. THOMPSON. But what I am trying to get at is, and you have stated it here as a fact, that the introduction of an efficiency system has caused sabotage. I have asked for the connection between the two, rather than their contemporaneous appearance, and you have told me of a case where the employees of the American Locomotive Works have refused to earn a bonus, and you say that that is sabotage. Now, you say it is passive resistance rather than sabotage.

Mr. CONLON. Yes.

Mr. THOMPSON. What case do you know of where sabotage in the way you have explained it, the ruining of the property or business of the proprietor, has been indulged in by the union forces as a defense against the introduction of efficiency systems?

Mr. CONLON. I do not know of any specific instance.

Mr. THOMPSON. Then it is true, as I stated before, that that is your deduction from the contemporaneous appearance of those two things?

Mr. CONLON. Yes.

Mr. THOMPSON. What is your basis for the statement that under the efficiency system the task is always increasing in its intensity?

Mr. CONLON. Mr. Taylor's statement on page 63 of his book, that he believed—

Mr. THOMPSON. What book, Shop Management?

Mr. CONLON. Scientific Shop Management. He says on pages 63 and 64 that the four shop principles are a large daily task, standard conditions, reward for success, and being penalized for failure.

Then he goes on further to say in his book that there should be periodical lay offs in order to teach the men an object lesson in the matter of passive resistance.

Mr. THOMPSON. When you quote Mr. Taylor it is only fair that you will quote his page and the book.

Mr. CONLON. I am trying to do that. Page 74 of his book.

Mr. THOMPSON. On scientific management?

Mr. CONLON. Yes. He says:

"The task idea is emphasized in style and piecework by two things, the high wages and periodical lay offs after a reasonable trial of incompetent men, the success of the system, the number of men employed on practically the same work should be large enough to have the workmen quite often have the object lesson of seeing men laid off for failure to earn high wages, and other men substituted in their places."

Mr. THOMPSON. That is the statement as to reason No. 1, that it requires a task that is always increasing in intensity?

Mr. CONLON. Yes.

Mr. THOMPSON. I do not understand from what you have read that you have shown that; as I understand it the task is a certain set time usual under the Taylor system in which a piece of work is to be performed.

Mr. CONLON. Yes.

Mr. THOMPSON. That merely fixes a standard or a yardstick to measure a man's efficiency?

Mr. CONLON. Yes.

Mr. THOMPSON. What cases do you know of specifically where the yardstick or standard has been increased, causing increased intensity of work on the part of the workers?

Mr. CONLON. I do not know of any specific instance from personal contact, but I have had evidence from the men that the time studies have been taken on their work three or four times, and prices set on each occasion.

Mr. THOMPSON. What shops and where, if you have a record of it?

Mr. CONLON. The Manchester shop of the American Locomotive Co., in Allegheny in 1907; I think it was January, 1907.

Mr. THOMPSON. What other places?

Mr. CONLON. That specific instance there I know of.

Mr. THOMPSON. Is that all the specific instances you have heard of or know of?

Mr. CONLON. For the benefit of the commission I want to say that I do not get access to the shops. I have to rely entirely upon what I get from testimony given to me by correspondents through our general office, which is located here in Washington. When you are asking me directly what I know of specific instances I must rely upon this testimony, otherwise my testimony is valueless to you.

Mr. THOMPSON. In other words, this statement of yours is based upon letters you have received from other people and have left in your mind a general impression?

Mr. CONLON. Yes.

Mr. THOMPSON. That the task is always increasing in intensity?

Mr. CONLON. Yes.

Mr. THOMPSON. But of your own knowledge you know only of one instance, and you can not recall any other instance that you received from the correspondents?

Mr. CONLON. Yes.

Mr. THOMPSON. Then the commission are to understand that that is the basis of your statement?

Mr. CONLON. Yes.

Mr. THOMPSON. Upon what do you base your second point, or reason, so-called efficiency systems have been devised in the interest of increasing dividends and with but slight regard for the employee?

Mr. CONLON. I believe that testimony was emphasized by the former witness here for the benefit of the commission, that the dividends had increased 2 per cent.

Mr. THOMPSON. But the testimony was also that the wages of the men had increased infinitely more than that; some going up, if I remember correctly, as high as over 70 per cent.

Mr. CONLON. The general run of the bonuses we have been able to secure have been nowhere near that much.

Mr. THOMPSON. What specific instances can you give now, any shop during any time, where you can make this deduction that they have been devised solely in the interest of increased dividends and have been of slight benefit to the employees?

Mr. CONLON. I say that that is the general belief of our membership throughout the country that is the idea of these systems, and they have no proof to the contrary, so far as their earnings are concerned. It has not been of sufficient enticement to them to accept this system yet.

Mr. THOMPSON. But you, yourself, know of no specific instance where that had been the effect?

Mr. CONLON. Oh, as a matter of figures to prove it out, no.

Mr. THOMPSON. But from your contact with the machinists in your union that is the present belief?

Mr. CONLON. Yes.

Mr. THOMPSON. Take the third reason you give, because the employees know that the overhead charge of accounting must be directly borne by the producer. If that overhead charge that is caused by putting in an efficiency system results in the cheapening of the production, more than would meet the overhead charge, there would be no absolute necessity for the consumer to bear that cost, would there?

Mr. CONLON. I do not get your question.

Mr. THOMPSON. If the saving by putting in an efficiency system and doing the work was greater than the cost of putting it in, there would be no additional charge put on the consumer for the product, of necessity?

Mr. CONLON. No; I think competition would take care of that, in the matter of the selling price.

Mr. THOMPSON. Then the third reason is one that must be tested by each individual case, as to whether it exists or not?

Mr. CONLON. Well, in answering your question, we know from experience that there is a large planning room there, and a routing room, and an accounting room, and a large number of clerks, in fact, in some instances the office is almost as large as the shop; we see no place where the employer is going to make the cost of that office of necessity, other than through the exertion of the producer who is making the product for sale.

Mr. THOMPSON. In other words, in your opinion the cost of installing such a system must of necessity be taken out of the producer by causing him to give extra labor?

Mr. CONLON. Exactly.

Mr. THOMPSON. Do you know of any instances of that?

Mr. CONLON. No; it is self-evident; it don't require any instances. If we have two men in the shop and we only had one timekeeper, and now we install a system whereby we must have three men, an accounting clerk, a routing clerk, and a timing clerk, those are nonproducers, inasmuch as they put nothing on the market for sale which is to pay those three additional clerks.

Mr. THOMPSON. I must confess that I do not think that that would be a fair test of an efficiency system, where you have two men in the shop. Take, for instance, where there are a thousand men in the shop, and where by the introduction of these efficiency experts with their planning room, etc., first, they will be able to lessen the work of the men and make better machinery and make

better routing, which take up lost motion, and in addition are able to help the worker to a better method of doing his work and as a combination of these two things they decrease the unit cost for the output, wherein, in such a case as that, would the producer or the workman be compelled by extra labor to absorb the cost of the introduction of the system?

Mr. CONLON. We take it for granted that competition will handle the selling price of the product, and that any extra cost paid in that shop either for clerk hire or for any other cause must be paid by the extra exertion on the part of those who make the product for sale.

Mr. THOMPSON. Let us examine that and see if it is sound. If the proprietor should introduce a piece of machinery which would cost \$5,000, which would have been borne by the product, but that by introducing that machinery his product was so many more times increased with the same number of men working by reason of the machine that it reduced the unit cost of the product, would not the expense of the machine, the introduction of it, be of value to the consumer? It must of necessity be.

Mr. CONLON. In that case I would judge that there would be some justification for your deduction.

Mr. THOMPSON. Assuming that the introduction of the efficiency system with reference to shop management and with reference to men management enables the shop to produce and turn out, taking into consideration the cost of that work, the product at a less cost, would not that be a benefit to the consumer?

Mr. CONLON. We can not accept that deduction, that this system is so broad in its scope that it is going to make dividends for the stockholder, increased wages for the employee, and also pay a 67 per cent fixed charge for accounting, planning, and routing. It must have some great elasticity to it that will enable it to do anything like that.

Mr. THOMPSON. You have assumed in your answer several separate things: First, you go back to the old question; you admit that if the introduction of that efficiency system reduced the unit cost of the product, then it has been a benefit to the trade, do you not?

Mr. CONLON. Yes.

Mr. THOMPSON. Then your objection is based on the fact that you believe, and those in your trade believe, that the introduction of the system actually increased the cost of the product?

Mr. CONLON. No; it don't increase the cost of the product, because the competition will take care of that; the selling market will take care of that part of it; but that we have got to turn out so much more in order to make up for this overhead charge.

Mr. THOMPSON. But if the turning out of so much more is made easier to the worker than the turning out of the smaller product before the introduction of the system, does it not stand to reason that it is for the worker's benefit, so far as the actual work is concerned?

Mr. CONLON. Yes; if it can be proven that it will be made easier.

Mr. THOMPSON. Assuming that to be a fact, it must be so.

Mr. CONLON. No; we will not assume that because we can not see where we can turn out more than we are doing at the present time to such an extent.

Mr. THOMPSON. But, Mr. Conlon, I am asking you if it were a fact. If you can answer that, you can make your other explanation afterwards. If it actually decreases the manual labor of the employee in turning out a unit of product, to that extent at least it would be to his benefit?

Mr. CONLON. Yes.

Mr. THOMPSON. Now, if in fact he does that, and by reason of doing that permits the employee to produce a greater amount of product in a given time, with less exertion, and by reason of that fact the employer increases his compensation, then the introduction of the system is of benefit to the worker, is it not?

Mr. CONLON. You are traveling on the assumption that it does all that?

Mr. THOMPSON. Yes; if it does all that.

Mr. CONLON. If it does all that, we could then—but we have to have an ocular demonstration of it first.

Mr. THOMPSON. Then, what case have you in your mind where the efficiency system does not have that effect—what plant, and where?

Mr. CONLON. I have stated one plant. Now, I might cite the Washington Navy Yard, where they have a modified form of the Vicker-Maxim system on certain work, and they have the employees of that place continually complaining about it, that the time is too short, although there is no bonus or anything of that sort being paid, they are complaining about the time being set too

short, and the engineers that are planning, they are planning behind screen doors, and it does not take into consideration the watching time that they have or anything else. I hear these complaints every Wednesday night, and there is no bonus to be paid, anything more than a man's record is supposed to be up to the standard in the case of a furlough.

Mr. THOMPSON. Then in the case you have mentioned there is no such thing as a bonus?

Mr. CONLON. No bonus.

Mr. THOMPSON. No bonus in question?

Mr. CONLON. No, sir.

Mr. THOMPSON. It is simply the question of the setting of a time task?

Mr. CONLON. The setting of a task; yes.

Mr. THOMPSON. What case of a private establishment do you know where that has been so?

Mr. CONLON. The American Locomotive Works of Manchester—or Allegheny.

Mr. THOMPSON. They have no bonus system there?

Mr. CONLON. They had a bonus system there, what was known as the standard-time system. I believe they experimented with it for a period of two years or more at a cost of \$800,000, and finally discontinued it as being unsatisfactory.

Mr. THOMPSON. That is a case where the company itself abandoned the system?

Mr. CONLON. Abandoned the system.

Mr. THOMPSON. Do you know what system they used?

Mr. CONLON. They use the straight piecework system now.

Mr. THOMPSON. It was not the bonus system, then?

Mr. CONLON. Yes; they had what is known as the standard-time system, with a bonus.

Mr. THOMPSON. How does that operate in connection with the piecework system?

Mr. CONLON. The standard time was a set time, and it had two—I do not recall it now. May I refer to this book here?

Mr. THOMPSON. Certainly.

Mr. CONLON. I read from page 199 of this pamphlet, which is Official Proceedings of the Railway Club of Pittsburgh, at its meeting on February 25, 1910. I said at that time: "Now, all these operations would be added up upon completion of the job and the combined time placed on the card as the standard time for turning a crank pin, and this time taken by a stop watch and under the most favorable circumstances must be lived up to to enjoy what is known as 100 per cent efficiency, which entitled the man to a bonus of 20 cents on the dollar based on his day rate, if he can maintain an average efficiency of 100 per cent for the entire week. But broken belts, dressing tools and grinding them, waiting for card, dispatching cards, and failure to find the necessary clamps and bolts play havoc with 100 per cent efficiency."

Mr. THOMPSON. You have been reading all that from this pamphlet?

Mr. CONLON. Yes, sir. So that when a man maintains an average of 85 per cent for the entire week he would be entitled to a bonus of 10 cents on the dollar, and so on up to 100 per cent efficiency, which entitles a man to 20 cents on the dollar. Then I go on to say something further on this subject.

Mr. THOMPSON. How intimately are you acquainted with the operation of the system in the shops you mention?

Mr. CONLON. Not as intimately as I should like to have been. My attention was called to it by reason of the strike that took place somewhere along in the fall of 1909. I went to New York for the purpose of adjusting this strike with Mr. David Van Alstyne, who was then first vice president of the American Locomotive Co. Mr. Van Alstyne very bluntly told me that the standard-time system had come to stay, and that we would have to accept it in all its ramifications or else get out of the plant. I went back and put the men back in the plant, because they had to abide by their constitution in the matter of striking; and, secondly, we were not sufficiently acquainted with the system to know whether they had a just cause for striking or not.

I then took it upon myself to find out how much cause for complaint they had, and I got into the shop, and I noticed that the men were working at a pretty good gait, and I noticed also that many of them were in a frenzy because they could not get the crane at a particular time when they wanted it to turn over a pair of cylinders, and my attention was especially attracted to a drill press where a young boy was drilling holes, and I timed that boy one day going to

the card-dispatching room to get his cards, and I found that going to get his card and put it back in again for the job, he took from a minute to a minute and a half time to put the card back; and I took the time on the job, and I figured that that boy spent 40 minutes trying to uphold the system and 20 minutes producing, and I thought that it was a pretty poor system that would require a boy to do that. Then I got interested in knowing just what particular amount of bonus these men were getting. I did not tell them what I was there for, but when they came up to the pay window and got their envelopes, they tore the top of the envelope off and threw the envelope away, and after they went away I picked up some 38 of these slips and put them into my pocket and took them to the hotel and counted them up. I have here the record of what the slips said. These slips I gave to the Railway Club of Pittsburgh, in order that they might verify them for their own satisfaction. The slip gave the name of the man, his weekly earnings, the amount of bonus, and the number of hours worked, and the number of workmen. I read from page 199 of the Official Proceedings of the Railway Club of Pittsburgh for 1910, quoting from a statement which I made at that time:

"In making my inquiry regarding the bonus paid I was surprised to learn of the few who had received any bonus, so started out to gather a number of pay envelopes at random to satisfy myself as to what extent it was being paid. I have here in my hand 38 pay envelopes that I thus secured, belonging to men who were working for the American Locomotive Co. during the week ending November 20, 1909, as machinists. These men are still working for this company, and their shop numbers are on the envelopes, together with their earnings and bonus paid, and I am going to leave them with the club for verification if necessary. This is what the envelopes say: The aggregate earnings in these 38 envelopes was \$510.86, and the total amount received in bonus was \$6.57. The highest bonus paid was 72 cents and the lowest was 2 cents. Fourteen men of the 38 here represented got no bonus whatever. However, the matter of bonus does not concern us, as we much prefer any bonus or premium that company might see fit to bestow upon us to be added to our hourly rate; but what did concern us was the marking down of efficiency, which constituted a cause for dismissal if not above 69 per cent."

Mr. THOMPSON. What system was that, if you know, which was installed there?

Mr. CONLON. I think it has something to do with Mr. Emerson's system. I am not sure about it.

Mr. THOMPSON. Your experience, then, in that shop, would indicate that the system there installed had not been efficient at all?

Mr. CONLON. No, sir.

Mr. THOMPSON. Take for a test, however, shops in which systems have been introduced, either Mr. Emerson's or others, where it has increased the pay of the worker and lightened his work and increased the output; what do you say with reference to such a system in a shop?

Mr. CONLON. I have never heard of such a place except from scientific engineers.

Mr. THOMPSON. You heard Mr. Dodge on the stand?

Mr. CONLON. Yes.

Mr. THOMPSON. Apparently his case is such a case.

Mr. CONLON. We have no evidence of it from any of the members of our association.

Mr. THOMPSON. But if such a case did exist, then in that particular case, at least, it would be a good thing?

Mr. CONLON. If it increased the wages of the employees and reduced their hours?

Mr. THOMPSON. Reduced their work—the burden of the work?

Mr. CONLON. And reduced their work; yes. I should say that it was a good thing.

Mr. THOMPSON. Then, these reasons which you give in opposition to the introduction of scientific management schemes would not pertain to such shops, would they?

Mr. CONLON. We are not opposed to efficiency. We welcome it. We want it. But we are opposed to any system of exploitation that is going to hold us up to a certain task, day in and day out, with no relaxation. If your question is, do we favor anything that has with it a method or a system with absolutely no point of relaxation in it, I say no.

Mr. THOMPSON. Then, we are to understand that the objection really is not to scientific management or to efficiency systems, but to those systems or to that class of management in which there is no relaxation?

Mr. CONLON. We are opposed to a bonus system, or what is known as so-called scientific efficiency systems.

Mr. THOMPSON. I am trying to get at why, and you say you are opposed to any system which gives no relaxation to the men?

Mr. CONLON. Yes.

Mr. THOMPSON. But if there should be such a system, which did give relaxation, there would be no objection?

Mr. CONLON. That does not require a task within a standard limit.

Mr. THOMPSON. Is it not possible that a man can have a task within a standard limit, which will give him an opportunity for relaxation?

Mr. CONLON. Yes; if that is possible.

Mr. THOMPSON. To give you an illustration, suppose even an ordinary slow worker would take a half an hour in doing a piece of work, and the standard test would give him an hour; there would not be any objection to that system on the basis that there was no relaxation?

Mr. CONLON. No.

Mr. THOMPSON. Now, suppose a system was introduced by which a man with less effort could complete that work in 20 minutes; what objection would there be to such a system?

Mr. CONLON. The very fact that it is a system; that it is a system of exploitation that is continually going on. We have had tasks and expect to have them. There is not an operation in a railroad shop that is not timed.

Mr. THOMPSON. Then you do not object to the task?

Mr. CONLON. If it is a reasonable one, no.

Mr. THOMPSON. Yes. Then the question is, after all, is it reasonable or unreasonable, fair or unfair?

Mr. CONLON. We object to a minimum task being set.

Mr. THOMPSON. No; but to get back: You say you have no objection to a task, because tasks are established in railroad employment?

Mr. CONLON. Yes.

Mr. THOMPSON. Then your objection is really based on its reasonableness or unreasonableness, its fairness or unfairness to the worker?

Mr. CONLON. Sure.

Mr. THOMPSON. Assuming, then, that in any given case a system of scientific management could be introduced to the advantage of the industry, and that the employees should have a voice in its introduction, in the setting of the standard, in the determination of the price; a voice, say, equal with that of the employer; what objection, then, could there be to the introduction of a beneficial efficiency system, in such a shop?

Mr. CONLON. Our objection would be considerably modified if we had a voice and a say in the matter.

Mr. THOMPSON. If you had an equal voice with the employer, and the system was a good one to be introduced in that shop, would help the pay of the men and would lessen their efforts, then your objection would be removed, would it not?

Mr. CONLON. Yes; if we had an equal voice in it.

Mr. THOMPSON. I think that is all that I care to ask the witness.

THE ACTING CHAIRMAN (Commissioner Delano). Mr. Garretson, have you any questions?

Commissioner GARRETSON. Is it not true that just as long as scientific management or efficiency systems or whatever is represented by any of those names is based upon the sweeping away of all that the men have done for themselves in a series of years past, just so long there will be objection to it?

Mr. CONLON. Yes, sir.

Commissioner GARRETSON. You read an excerpt from your laws, which was the declaration of the attitude of your organization toward task work. I am using that to describe a half a dozen things. By whom were your laws made—by the rank and file of the organization?

Mr. CONLON. Yes.

Commissioner GARRETSON. Or by the officers?

Mr. CONLON. They are made by the rank and file of the organization; by a referendum vote.

Commissioner GARRETSON. Of the individuals themselves?

Mr. CONLON. Of the individuals themselves.

Commissioner GARRETSON. Therefore the declaration of the law is the declaration of the rank and file?

Mr. CONLON. Yes.

Commissioner GARRETSON. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Commissioner Lennon, have you any questions?

Commissioner LENNON. There is just one question that I want to ask Mr. Conlon. Is not your attitude upon this question based more upon the fact that, no matter for what reason, collective bargaining has not been tried to any extent in these shops?

Mr. CONLON. Yes; that is quite largely true.

Commissioner LENNON. Yes.

Mr. CONLON. After our trouble with the standard time in the American Locomotive Co., we were called in by the vice president who succeeded Mr. Van Alstyne, and asked if we would bargain with him on piecework. We had never agreed to bargain even on that until that time and we readily agreed to go ahead and do the best we could with anything that would be a substitute for the obnoxious standard-time system.

Commissioner LENNON. What do you think would be the attitude of your union if some employer in your line in this country would communicate with your headquarters saying that they had the efficiency system—by some name, no matter what—instituted in their establishment, and they would like to take up for consideration with your union the question of collective bargaining? Do you feel that your union would refuse to go and make investigation and go carefully into the matter, if such request should come to you?

Mr. CONLON. Do you mean that we would refuse it?

Commissioner LENNON. Yes.

Mr. CONLON. No, sir. We would lay that matter before our general executive board, and I am sure that they would recommend investigation into the matter at once.

Commissioner LENNON. I rather infer from your answers to Mr. Garretson's questions and my own and some of Mr. Thompson's that if a friendly attitude had been maintained so far as unionism was concerned in some of these shops, you would probably have gone into a more thorough investigation and would, if you could, have probably entered upon collective bargaining with these firms?

Mr. CONLON. There are some features of the systems that we might bargain on.

Commissioner LENNON. Yes.

Mr. CONLON. And there are some that we have not yet brought ourselves to the point of bargaining on, such as the the stop watch and the bonus part of it.

Commissioner LENNON. You have collective bargains as to piecework already, have you not?

Mr. CONLON. Very few.

Commissioner LENNON. Very few?

Mr. CONLON. I do not believe we have any now, at the present time. Yes; we have one with the Norfolk & Western Railroad.

Commissioner LENNON. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Ballard?

Commissioner BALLARD. You have read from the constitution and by-laws of your union?

Mr. CONLON. Yes.

Commissioner BALLARD. Would you mind leaving with us a copy of them?

Mr. CONLON. No, sir.

Commissioner BALLARD. That is all.

Commissioner HARRIMAN. May I ask—you spoke of not having yourself personally seen many of these shops where this scientific management is installed, and I want to know how many of the labor people you think have really studied the question or really understand it; I do not mean the men themselves so much as the leaders. Do you think they have gone thoroughly into it, and do you think many of the leaders have been to these places and investigated, or do you think that they have just taken it from what they have read and hearsay, and, as you have said, by letters from the employees?

Mr. CONLON. Our experience has been based entirely upon grievances that have come to us. Now, as a matter of fact, there has not been sufficient of these systems introduced where our membership has a foothold for us to come to any practical knowledge, or to get any knowledge practically, or an opportunity of investigating the matter; the employers generally throughout

the country have not seen fit to adopt this system. Railroads—I do not know of one, except the Santa Fe, that has adopted it, and, as a consequence, we are limited as to an opportunity for investigation.

Commissioner HARRIMAN. What I mean is, that apparently you have taken quite a decided stand against it; that is, you are advising a very decided stand against it.

Mr. CONLON. Yes.

Commissioner HARRIMAN. Is it from personal knowledge that you have taken that stand?

Mr. CONLON. It has been from a personal knowledge with other systems that have been a forerunner of the Taylor and Emerson systems; one known as the Towne and Halsey system, which has been exploited for some years; but they all look alike to us.

Commissioner HARRIMAN. But are you sure that they are alike?

Mr. CONLON. No; they are not alike, inasmuch as some are premium systems and the others are bonus systems, but they are synonymous to us; they are about the same.

Commissioner HARRIMAN. Have you ever seen the Taylor system working in arsenals? I understand that it is installed in the arsenals at Watertown.

Mr. CONLON. Mr. Alifas, the Government representative, has seen it in operation in the arsenals. He will follow me later on.

Commissioner GARRETSON. Let me add one more question, Mr. Chairman.

The CHAIRMAN. Certainly.

Commissioner GARRETSON. Is it not a fact that a very large portion, or virtually all, of the laboring men conversant with conditions have based their objection largely to the efficiency systems on the writings and utterances of the authors of those systems?

Mr. CONLON. Very largely.

Commissioner GARRETSON. And the declarations contained therein?

Mr. CONLON. Very largely.

TESTIMONY OF MR. DAVID VAN ALSTYNE.

Mr. THOMPSON. Will you give us your name, address, and business?

Mr. VAN ALSTYNE. David Van Alstyne; residence, 105 West Fortieth Street, New York City.

Mr. THOMPSON. What is your profession?

Mr. VAN ALSTYNE. At present I am assistant to the president of the New York, New Haven & Hartford Railroad.

Mr. THOMPSON. What experience have you had with so-called efficiency systems?

Mr. VAN ALSTYNE. I was the introducer of the Emerson system into the American Locomotive Co. That is about the extent of my experience.

Mr. THOMPSON. That is the experience which Mr. Conlon spoke of?

Mr. VAN ALSTYNE. Yes.

Mr. THOMPSON. What was the attitude of union labor toward the introduction of that system, if you know?

Mr. VAN ALSTYNE. Union labor and nonunion labor were opposed to it.

Mr. THOMPSON. What was the reason for the breaking down of the system, if you know?

Mr. VAN ALSTYNE. It had nothing to do with the system.

Mr. THOMPSON. Well, what was the reason?

Mr. VAN ALSTYNE. It was outside. You mean why they took the system out of the concern?

Mr. THOMPSON. Yes.

Mr. VAN ALSTYNE. They took it out after I left, immediately after I left; but it had nothing to do with the system. It was a totally different affair.

Mr. THOMPSON. Do you know what the affair was?

Mr. VAN ALSTYNE. Yes; I do.

Mr. THOMPSON. Did it have anything to do with labor?

Mr. VAN ALSTYNE. Nothing to do with labor at all.

Mr. THOMPSON. Do you know of the use or introduction of an efficiency system by and with the consent of labor anywhere?

Mr. VAN ALSTYNE. It was done by and with the consent of organized labor in the American Locomotive Co. when it was finally accomplished.

Mr. THOMPSON. Is it in existence there now?

Mr. VAN ALSTYNE. Not that I know of.

Mr. THOMPSON. What kind of agreement, if you know, was made with union labor with reference to the introduction of the system there?

Mr. VAN ALSTYNE. I made an agreement with the molders' and blacksmiths' unions, which was the ordinary trade agreement, but the principal feature of it was that the unions committed themselves to a maximum output, of which the company was to be the judge, and the basis of it was the Emerson standard time system and a bonus paid for efficiency above two-thirds in addition to the straight day's wages.

Mr. THOMPSON. Were there any provisions in the contract as to how this worked out? Did they make any provision in regard to adjusting the standard?

Mr. VAN ALSTYNE. In order to facilitate matters we agreed to make the standard times by means of a demonstrator, and if there was no objection to that we put the time into effect, and it became the standard; it was provided for in the agreement that the shop committee could object at any time they wanted to, and if the shop officials and the shop committee could not agree it was further provided that it would be officially settled by me and the head of the union.

Mr. THOMPSON. Was there any provision for a third party or umpire in case you and the head of the union disagreed?

Mr. VAN ALSTYNE. No.

Mr. THOMPSON. During the time the system worked and while you were there did you and the head of the union agree as to the standards to be fixed?

Mr. VAN ALSTYNE. We had no occasion to.

Mr. THOMPSON. There was no complaint about that?

Mr. VAN ALSTYNE. No.

Mr. THOMPSON. What was the effect on the earning power of the workmen, if you know?

Mr. VAN ALSTYNE. It increased the average materially, but by reason of changing from a very poor piecework system, and by reason of the fact that the agreements were based on day wages, day rates, day rates which were similar to the ruling rates in the neighborhood of the various plants, in some cases the rates were actually reduced by agreement.

Mr. THOMPSON. You have heard the testimony of Mr. Conlon in regard to that plant?

Mr. VAN ALSTYNE. Which plant?

Mr. THOMPSON. The American Locomotive plant.

Mr. VAN ALSTYNE. We had 10 plants.

Mr. THOMPSON. But the one at Manchester.

Mr. VAN ALSTYNE. Yes.

Mr. THOMPSON. In which he said that he picked up a great number of pay envelopes and that the highest bonus that any workman got was 79 cents, if I remember correctly.

Mr. VAN ALSTYNE. I understood him to say that was Pittsburgh.

Commissioner GARRETSON. That was Pittsburgh, Mr. Thompson.

Mr. VAN ALSTYNE. That was Pittsburgh. Pittsburgh was full of agitators at that time, and they were doing all they could to interfere with us, but that was only one plant out of ten, and that was only temporary.

Mr. THOMPSON. Was the system introduced into the other plants?

Mr. VAN ALSTYNE. Oh, yes.

Mr. THOMPSON. Is it working in any of the plants now so far as you know?

Mr. VAN ALSTYNE. I don't think it is.

Mr. THOMPSON. Generally, what was the effect of the introduction of the system on the relations of the workmen and the management in other places than Pittsburgh?

Mr. VAN ALSTYNE. I should say they were improved, because the general officers of the unions with whom we made the agreements were well satisfied. I was well acquainted with them and met them frequently; in fact, when we made the agreement with the molders' union Mr. O'Keefe and I visited all the plants, and he represented the company and I represented the union, in that he put it up to the men that they had made an agreement and that he expected them to live up to it in good faith, and I urged the nonunion men to go into the union on account of the agreement which was made by the union officers.

Mr. THOMPSON. You heard Mr. Conlon speak about the strike that occurred?

Mr. VAN ALSTYNE. Yes; that was at Pittsburgh.

Mr. THOMPSON. And that was due, in your opinion, to these agitators, I take it?

Mr. VAN ALSTYNE. Yes.

Mr. THOMPSON. And not to the introduction of the agreement?

Mr. VAN ALSTYNE. No; because I had every reason to believe that if I had offered the same agreement to the machinists' union, which had no organization in the plant except locally, we could have made the same arrangement with them easily.

Mr. THOMPSON. In the introduction of this system, in the joining of yourself with the workmen to adjust standards, in your opinion was that a good scheme?

Mr. VAN ALSTYNE. Absolutely.

Mr. THOMPSON. And would be a good scheme in the introduction of systems?

Mr. VAN ALSTYNE. Yes.

Mr. THOMPSON. You have no opinion on the matter of the introduction of the umpire, have you, between you two in case you fail to agree?

Mr. VAN ALSTYNE. I think it might have been a good one, but we didn't get that far. We had no occasion to.

Mr. THOMPSON. That is all I care to ask.

Commissioner GARRETSON. Mr. Van Alstyne, I do not know whether I quite understood you or not, but you believe in the putting in of an efficiency system that it is more desirable to take the matter up with the unions that are affected rather than to attempt to force it in on them?

Mr. VAN ALSTYNE. If I were a laboring man I should fight an efficiency system to the death.

Commissioner GARRETSON. If they did not?

Mr. VAN ALSTYNE. Yes.

Commissioner GARRETSON. You believe that men and hogs are not easily driven?

Mr. VAN ALSTYNE. I believe that an efficiency system or a scientific-management system in a shop is fatal to unionism, and I think we need unionism more than we need efficiency management.

Commissioner GARRETSON. That is all, Mr. Chairman.

Commissioner DELANO. That is all; I do not care to ask any more.

Commissioner BALLARD. The only thought that occurs to me is this: If in 10 of these locomotive plants the system was installed, and it was thrown out, you would not care to give the reason?

Mr. VAN ALSTYNE. It hadn't anything to do with labor. You perhaps have read more or less about the American Locomotive Co. in the papers lately, and you can draw your own conclusions.

Commissioner BALLARD. Do you think this efficiency system is fatal to it by itself; that is, unless it is part of the consideration with the employee and go along with it?

Mr. VAN ALSTYNE. Every labor agreement should have two sides to it; the ordinary railroad agreement, for instance, binds the employees to certain specific rates of pay, and certain apprentice rules, and certain hours, and all sorts of things. It binds the employee to do nothing except sit in the shop a certain number of hours. It is my judgment that every operation should be measured by piece price, or standard time, or something; that these times or prices should be made a part of the contract, and should be subject to joint agreement or joint adjustment.

Commissioner BALLARD. Under those conditions it would not be fatal to the unionism of the shop?

Mr. VAN ALSTYNE. No.

Commissioner GARRETSON. May I add one question here? This is drawn out of this statement of Mr. Van Alstyne's. Probably he only makes it from his own viewpoint. You spoke of railroad agreements; you meant shop agreements?

Mr. VAN ALSTYNE. I means shop agreements; yes.

Commissioner GARRETSON. Then you are not familiar with road agreements?

Mr. VAN ALSTYNE. I am; yes.

Commissioner GARRETSON. They all contain—there is another proviso in road agreements in regard to only getting so many hours; they contain that measure.

Mr. VAN ALSTYNE. You are right; I should have mentioned that.

Commissioner GARRETSON. That is the point I wanted to bring out.

Mr. VAN ALSTYNE. All agreements should be on the same basis as the engineers' and firemen's and conductors' agreements—definite.

Commissioner HARRIMAN. I understand that believers in scientific management claim that the system is the best friend of the employer or laboring man. Do you deny that? Do you deny that it is a friend to them in the end?

Mr. VAN ALSTYNE. I do not think it is good for the laboring man to have his loyalty to the union destroyed. I think the laboring man, when he can make the scientific management a part of the contract with his employer and do both, work under the efficiency system and have an incentive to remain loyal to his union, would be better off.

Commissioner HARRIMAN. Could not that be possible? Could that not be brought about, that the union by having a scientific management, having the two things go along together?

Mr. VAN ALSTYNE. Absolutely. We made such an agreement in the American Locomotive Co.

Commissioner HARRIMAN. You said a little while ago that it would be fatal to the union.

Mr. VAN ALSTYNE. Unless it is made a part of the agreement. There would be no trouble with it then.

Commissioner DELANO. That is all, Mr. Van Alstyne. Thank you very much.

TESTIMONY OF MR. CARL G. BARTH.

Mr. THOMPSON. Will you give us your name, residence, and occupation?

Mr. BARTH. Before I do I would like to get a little more air. I am pretty nearly smothered.

(Whereupon an attendant opened a window.)

Mr. THOMPSON. Is that better?

Mr. BARTH. I have not felt the effect as yet, but in anticipation of some improvement I will proceed. My name is Carl—written with a C and not a K—Carl G. Barth. There is more to it, but it is too long to state.

Mr. THOMPSON. Where do you live?

Mr. BARTH. Well, ask me where my wife lives, and I can tell you. I live where she lives—6151 Columbia Avenue, Philadelphia.

Mr. THOMPSON. I didn't know you had been married.

Mr. BARTH. Oh, I have been married for 33 years. I don't remember the time I wasn't married.

Mr. THOMPSON. What is your business?

Mr. BARTH. Well, that is an awfully hard question to answer, but as people insist that a man assume a title in order to cover a multitude of sins, I assumed the title of consulting engineer, because I can do anything under the sun under that title.

Mr. THOMPSON. Are you acquainted with what has been called by Mr. Taylor "scientific management shops," as relating to the workingmen?

Mr. BARTH. I should certainly say I was, if any man is. I am, next to Mr. Taylor.

Mr. THOMPSON. You have had many years of experience in that regard?

Mr. BARTH. It will be 15 years this summer since I got in touch with that work, although I knew Mr. Taylor 30 years ago also. I know some of his earlier efforts.

Mr. THOMPSON. I will first direct your attention to this question: After a standard is set for piecework, what provision is made for preventing the management from changing it in order to drive the worker to a still higher rate of production?

Mr. BARTH. Nothing whatsoever, except self-preservation of the manager, if he is not one of these darn fools that we will kill yet, as one was killed yesterday, that he will have sense not to do it.

Mr. THOMPSON. What is the protection?

Mr. BARTH. The only protection I know of is that there are enough of these fellows around, I will admit; but I would like to see some other kind of protection.

Mr. THOMPSON. What is your experience with employees and managements as to their taking advantage or not taking advantage of that opportunity?

Mr. BARTH. So far I have not seen any, but I have worked, unfortunately, in an establishment where they have driven the men before so much that a time-study man has been brought up, and not by myself but by others, that I have been somewhat in touch with; they have been in that spirit, but the time is rather short, in a good many instances, so that the matter approaches somewhat the condition in the shoe factories that I have heard about. It is in factories where the work is similar and where the men should be treated more like women have been, where the proper thing has been done fully. Also in connection with that matter it has happened that a man like myself is usually

asked to take an extended leave of absence, usually for a lifetime, long before he likes to withdraw and before he can get people to see that it is to their advantage and what ought to be done. I never yet had the pleasure of spending half the time that I would like to spend in a plant, and I do not expect to have that pleasure. I do not expect to live long enough. God Almighty could not live long enough to do it, so what can you think about a human being?

Mr. THOMPSON. What experience have you had in introducing the system where the workmen were organizing unions?

Mr. BARTH. Nothing whatsoever. Curious enough, I have not been in touch with any organization at all, except once on the outside I met nine laboring men at Pittsburgh and they started in to eat me up, but before I got through, at the end of two hours and a half, we were very good friends and shook hands, and there wasn't a man there that I did not feel that I could cooperate with when I got through with him.

Mr. THOMPSON. Do you see any objection to the cooperation of organized labor and scientific management in the shop?

Mr. BARTH. Not in case these fellows will come to me to go to school for two or three years first. I will give you the same answer as Bob Ingersoll gave a man once. I never forget it, because it is a fine answer of a fine man, given to a man in the audience who objected to something that he said about the Bible. He said "My dear friend"—the audience wanted to shut down on him, but Ingersoll said: "No, let us hear what he has to say." The man wanted to talk about matters which from the point of view of the audience were perfect nonsense, but Ingersoll said, "My dear friend, if you will go back to an ordinary common school first for three years, and then go to college and spend three or four years there, and spend three or four years more on top of that thinking about these matters, I will argue that question with you;" and so it has to be with a great many people; I would want to have them put themselves in my hands so that I could teach them and they would know what we were going to argue about, before we would have any discussion. But I am willing to admit that by nature I am particularly inclined to instruct, and particularly inclined to receive instruction. I am always ready to teach and always ready to learn.

Mr. THOMPSON. Providing the laboring men do come and are instructed by you as you say, what objection would there be to cooperation between union labor and the employer?

Mr. BARTH. I do not think there would be any in the slightest, so far as I can see; absolutely none whatever. I never had any trouble with anybody that went to school with me. That is saying a good deal, but I will stand on my record with anybody that knows me.

Mr. THOMPSON. Then, there is not any necessary objection to organized workmen working in connection with the scientific-management system?

Mr. BARTH. Nothing except the education that I am speaking about. That has got to come to them some way or other. They are going to be educated to the ideas we are trying to work out, so as to come in and argue on the question.

Mr. THOMPSON. You mean assuming that they are educated to believe in the scientific-management system, as you understand it?

Mr. BARTH. Yes.

Mr. THOMPSON. Then, what objection would there be to joining with the proprietor of the shop in carrying out the system?

Mr. BARTH. Only I believe there would be mighty little for them to do, but to follow that thing out, to take up the spirit and to follow that as far as I am able to, I believe it would be possible to argue about a base rate. Fluctuation and hard times come, when reductions should be made, and then extraordinary good times, there should be an increase. In good times everything costs much more, because normal things keep on costing high. Of course, you understand I am no economist, but I have been taught that as a young man, that in good times things are cheap, and in hard times things are dear, and the fluctuations in this country are upsetting these things, and the great financiers—I don't understand that question, though; that is not part of my business.

Mr. THOMPSON. Then you believe it is possible for the men and the proprietor to get together on that question of setting a basic rate or standard?

Mr. BARTH. Yes; there are awfully few impossible things in this world. I think it is within the realm of possibility.

Mr. THOMPSON. Would you say it is inadvisable?

Mr. BARTH. No; I would not say that at all; no, sir. I simply have not thought very far about it, because I am so imbued by the idea, and I do not think that all the daily troubles that somebody tells us are going to come next year—I don't think about them; we haven't had that trouble yet.

Mr. THOMPSON. Then you have not taken into consideration the question of collective bargaining?

Mr. BARTH. No; not very seriously, because I do not shake hands with the devil.

Mr. THOMPSON. As a scientific man would you prefer not to give an opinion?

Mr. BARTH. I believe that is a false idea among the public, that every man has a right to his opinion. I believe there are very few men who have a right to their opinion. I consider—and I am constantly studying—that you have no right to an opinion, because you never sweat for that opinion, just because your grandfather or your mother had it or some old woman that you have heard around the street corner had it. I do not consider that a good right that I should have that opinion. If you lie awake at night and study, and so forth, and so on, it is possible to get opinions; but I have got mighty few; but, by the Almighty, they are strong. [Laughter.]

That is the Taylor system, but, you know, people prefer to modify it somewhat.

Mr. THOMPSON. Then, you have not entertained an opinion of the collective bargaining system, attaining it through a process of study?

Mr. BARTH. Not that I consider myself entitled to an opinion, a serious opinion, except so far as people, you may say, absorb something through the atmosphere; but I have sense enough not to perspire it out again. [Great laughter.]

Mr. THOMPSON. What effect, if you know, has the introduction of scientific management had on the welfare of the workmen who work thereunder?

Mr. BARTH. Now, will you allow me to make quite a little discussion about those matters?

Mr. THOMPSON. It is up to the chairman.

Mr. BARTH. Mr. Chairman, may I be allowed just to take the initiative in some matters myself on the whole scheme of management?

The ACTING CHAIRMAN (Commissioner Delano). Go ahead.

Mr. BARTH. I consider that I occupy quite a singular position in this whole matter, because most of it is nothing but talk. I got into this work because I proved myself to be a good efficiency engineer and particularly inclined to make use of what little mathematics I had learned in the old country on practical problems, and that is why Mr. Taylor got me. For 14 years I was a machine designer, and I designed machine tools that were as good as any of them. I rose in a short time from \$10 a week to double the salary of a foreman. I was not made a foreman for certain reasons. I will not mention them. I had my own ideas of what certain things about machine tools should be, and so, of course, I got the start, and the ideas, some of them, I got from England. I found out that they came from England. I was one of the few men that found out that Englishmen knew something 50 years ago, some things that some of us are just beginning to find out now.

So, when I came to Mr. Taylor my combined knowledge of machinery and the ability that I had in the applying of mathematics in that relation later on made a most happy combination, and I fell into that work in a wonderful way, and I have been working on it with a great deal of enthusiasm for many years. In fact, my pastime is to work in a little different way, not fussing and quarrelling with men in the shop—I do not mean now literally; I mean fussing around—but to sit down by myself with God Almighty and a piece of paper and a pencil.

I got an ideal on which I believe that all machine-tool builders should build their tools. You understand, it was a crank's idea five years ago, but I have the great pleasure now to find that machine-tool builders are borrowing my ideas and are looking on me as an authority as to how to build machine tools; and it is this ideal of my own that I am working for more than anything otherwise, because it is based on efficiency of making tools more than anything that people dream of to-day. I want to touch that, you may say, from a certain point of view, that every machine tool in a machine shop is adjusted to certain musical chords, and they should be together, so that there is harmony. I do not mean that the physical noise is going to be less, but with a knowledge like mine on the part of everybody else around there, there will be more or less music and everything running in harmony. I will tell you what I mean by it if you will get me the blackboard which was here this morning for my benefit and

was taken away. Therefore, I hope somebody will bring it back. If you want to have it put before you properly so that you can understand the whole matter, let me have the blackboard. You can have your choice; if you want to have it, you can have it.

(Mr. Barth here pinned a blue print on the blackboard.)

What I have to say in this matter of perfecting machinery is, of course, a trifle. I am not conceited about it. Maybe other people think that I am, but I do not believe I am. I think that I occupy a unique position in this work. This blue print is a logarithmic layout of speed ratios.

(Mr. Barth here gave a short explanation of the diagram on the blackboard.)

Mr. BARTH. Now, it is the preparation of a standard for the machinery in a shop that is my work, and that is where I claim that I do more than anybody else to really standardize the differences; and when I say "standardize" I do not mean that I use standard time. That is a confusion of terms, to my mind. I mean the standardizing of conditions before you do the work. That is something tangible and something physical. And my work consists in blazing the way. And then, I never prepare a thing as I like to have it. That is the difference between what I do—I can come back to certain other things—and what other efficiency engineers do. They go and touch the high spots, do a little bit if they can, usually mighty little in really standardizing the conditions, and when I make a time study that means nothing. It would not mean anything.

Go right in the shops and find out who put a system in and you will find out just what it is. I will give you all that I have here, and you need not pay a dime for it if you do not want to, but it can be yours for nothing, if you want it, and I can throw light on lots of things, if you want this, and I would rather say too much to-day than not say enough; and I will say more privately, but it will not be for publication.

Now, I am trying to do something that will live when I am gone—something that will live even when I am dead; not only when I am gone from the shop and gone home to my wife. [Laughter.] Now, take these specific instances. Now, here I show the conditions in regard to a single manufacturer, and when you look at it you see that he does not know a thing about his work. Here you see the difference in the adjustment of these machines all the way through. Here are drill presses varying a little bit in size, you see. Look at these differences; see they vary, when they should be the same. Now, how can we get them the same distance apart, and what distance should they be apart? That is where I know I have got the machine tool builders to agree to this idea of mine, on the distance between the notes in an octave. Now, after spending some money—Mr. Dodge, you recognize this as some of the work in your shop, do you not?

Mr. DODGE. Yes.

Mr. BARTH. You see, these are all different. It is just as if this one had the nose in the back and this one in the front. [Laughter.]

Now, here comes the speed. You see how this thing comes, one big one and one smaller one, and this manufacturer has 16 speeds, and he loses 5. He tells his customer, "I have 16 speeds." He has got only 11. The most charitable thing to say is that he does not know any better; he is telling a falsehood, but it is an unintentional one. He does not know any better. That is what I have told them. The machine is so constructed that I was not able to do better with it without throwing away half of the machine.

Here you see where I still sacrifice some speeds.

(Mr. Barth continued his explanation of the diagram referred to.)

Now, I want to show you, so long as you have the patience to listen to me, just what I have done in one of those machines to bring them into line and to harmonize them and standardize them. Now, I haven't got much time to sleep, but my dream is—and I dream sometimes in between work and sometimes at night—my dream is that the time will come when every drill press will be speeded just so, and every planer, every lathe, the world over, will be harmonized, just like the musical pitches are the same all over the world. We can study that out and say, "We will get nearer and nearer to standardizing our material," so that when we ask for a certain material we get it, so that we can standardize and say that for drilling a 1-inch hole the world over that will be done with the same speed.

Mr. Dodge, you never knew that dream of mine. That dream will come true, some time.

Now, I have an invention here, but I never expect to get anything out of it. My son gets a little out of it, but I do not get anything. I have had to change all those things, and wherever you see a figure on this chart that means a new gear. Now, it is my principal job, gentlemen; and training young men to understand that. It is not a thing that comes overnight, but here is a thing that I am most sorry for, that my son has been working with me for seven years, and he is still my apprentice, whereas others have men with them for a year and then those men go out as efficiency engineers. [Laughter.] We had a man at Watertown Arsenal who came in and wanted work; a fine looking fellow; he came and applied for a job. He saw Col. Wheeler and talked with him, and the colonel was very well impressed by him. He sent him out to the time department to see Maj. Williams, and he was also very well impressed with him. Then, he sent for me to come in and see a man that he said looked very promising. It took me just 10 minutes to find out about him, because I have a certain way—not through a lawyer, but in my work there is a way—of finding out what a man knows. I asked him what his education was, and I found out that only a year ago he had been in a drug store as a drug clerk, and he had been there an assistant to one man who had once been an assistant to one of the great concerns of Europe—I am not saying any name—and in that way he had become an expert in cost accounting and in bookkeeping and in time study and all those things that I feel that I am not absolutely an expert in myself. As to the time study I do not know much about it except the theory. I can not use the stop watch. I wish I could, but life is too short. I turn that over to inferior men; the most important part of the system I turn over to inferior men, because the final thing is to make that right. But I have enough to do to prepare the way for that fellow. Like John the Baptist, I prepare the way. [Laughter.]

Now, here I will show you what is implied in just one single plant. Here are the things we have to do [indicating on blue print]. Every one of this group of machines had to have a chart made like that. Every pulley, every gear, if you can not get it from the manufacturer; and to-day even the great manufacturers can not give you drawings representing the machines that they build. They ought to be taken out and hung or drowned. They do not belong in 1914. [Laughter.]

Still, some of them have high reputations. It shows how crudely things are still done in this country. I do not know about any other country. I got disgusted over there and came over here. [Laughter.]

Now, I want to show you something further of that work. These little lines that you see there mean very little to you, but they mean everything to me [indicating on another chart]. By trying all those speeds as we find them, I can at once see what state of affairs we have in that shop, whether things are harmonious, or whether we have any old thing, and that is what we usually find. The instructions come along with the machine for speeding the machine, and the man figures out from that—it is a tremendous problem for him, you know—although it is nothing for anyone that knows how—he figures out that it is 25 or 30, and so he gets this again and again. When we put two speeds on the countershaft, we double up, and many a time a man thinks he has provided for 16 speeds, and what has he got? He has got only 10. That shows it.

Now, there is the same thing, and you see how it is condensed [indicating on chart]. You see how the spaces are more regular, and there is where they would not give me the money that I wanted, and I made the best that I could with what I had.

Now, this is much better for the workman, because while the workman knows mighty little about the machine he knows far more than the management, as a rule. Of course, there are exceptions.

Now, here is a case where I have laid out—of course, this was made over again for a lantern slide [indicating on another blue print]. I sometimes give talks. I hate to give them, but sometimes do, and when I give them I hammer away. There you see a group of machines, and you see the enormous gaps in that group of machines. There it is as they should have been [indicating on another chart]. That is what it will be 50 years hence, when manufacturers have either agreed on my periods or some other periods that will be just as good or better; although I think they will have a hard time to get anything better—I will say that, from the study that I have given it. Of course, nothing is simpler than two and one, and one and one and a half in between. There is nothing simpler than the square root in between one and two. How much the com-

mission understands of that I do not know, and I do not think it is very important. I will give them credit for something, though. I will give them a whole lot of credit for being the best body of men to study this subject. You can take that as you want to. At least, they ought to have an engineering counsellor. There is lots more to it, you know, but I have an awful good memory, so that I don't get in the habit of making notes as much as I ought to. I tell everybody else to do it, but I don't do it myself, much.

Now, here is a phase of the work that I do. If it is a question of asking me how to introduce scientific management in a machine shop, I never try it the same way twice. I go and spend only a very few days and make a report. One time I was asked to make a report by Mr. Redfield. After he had examined me in the last investigation he asked me to go to one of these companies, and I went and spent three hours in that company and then spent three days writing a report. At other times I can spend three days and make my report in three hours, but I am a very slow writer.

I ought to, but I have never learned as a young man, and you know you can not learn an old dog new tricks.

But, now, then, everywhere I go I do the preliminary work. I get farther along or less farther along—that may not be good English, but you understand me—before we do something to get more work out of the shop, because it is perfectly true that primarily it is the employer who looks after his interests and has got to make a showing. He is after his interests, as a rule, first. So I got no less than two cases of record. Mr. Dodge is one of them, but he was too modest to mention it this morning, but after we were working at the Link Belt for a while it commenced to look good. It did not look so good at first, but it came to look better later. He said, "Now, Barth, I will be perfectly satisfied if I don't get anything out of this system, if you get the men more." I did not think about throwing this bouquet to him when I came up here, but as we are friendly I will do it, because it is true, although I do not always tell the truth.

Now, then, my first object in a shop is to gain, to keep, and more to keep than to gain; but I have got to gain before I can keep. That is what the millionaires do, anyway. And in conference with the men—I wanted them to get used to me; I wanted them to understand that I am an awfully ordinary son of a gun. I put on overalls and I carry around tools among them. I didn't look very stylish, but I do not like these efficiency men who put on a good deal of style and wear kid gloves, and I don't have an office boy to carry the tools around for me, so in order to save time I picked up the tools and carried them around myself. I did not do that to play to the gallery, although I know it is good policy to do that—although I didn't do it for that. Mr. Dodge said that I didn't have any policy, and he got mad as hell at me once in a while, but I really did it because I can do it, and why shouldn't I do it? The time may come when I can't do it, but I am pretty lively yet.

Commissioner WEINSTOCK. We have discovered that.

Mr. BARTH. Somebody else has, too, but not always. Well, that is my prime object, and I am looking for benefits, first, to do that kind of work with the machine and improve it, that the man suggests. I try to find out what the matter is with the machines, and I tell you, all this talk about the employer looking out for the machines and not looking out for the men is all rot. I should say it is just about even, and it is most deplorable, from my point of view, because I look at the machine first. I haven't seen these sickly over-worked fellows that they talk about so much. When I meet them on the street cars they are as well dressed as I am, and they have been to the same kind of amusements, except possibly they don't spend the same amount of time that I do to get clean; otherwise there is no difference; I see no difference. I am very particular about that. I don't care how dirty I get, but, my God, I want to get clean afterwards.

But in that way I try to get at and correct the most crying defects and crying abuses of the man's machine, and it is, to my mind, most deplorable the amount of waste there is going on in this country by not repairing machinery. In my judgment the machinery doesn't fare half as well as most men do. Do you know why? My God, it is because they can't talk any more than a dog can. If they could, they would be howling terrible around here.

I was up against one case—I won't mention any names, but it is a very large company—I just happened to think of it. They had 60 drill presses in that plant, and there was not one on which I could test properly a 1-inch drill. Think of it. I had to buy absolutely a new one, and when I bought it, it

had to be modified to suit me. I got in touch with the best drill manufacturers of the country, and they all agreed to do what I wanted, so I got the machine to test the drills in such a way that we simply got the employer wondering what in the world was up, and they never saw anything like that in their lives before. Then there was a man came to me the next day and said "Barth, I have been laying awake all night long; I wonder how in the world you can make these drill makers do as they did." But that is a fact, and I want to mention that to show you how little people know about their own business. You know most doctors kill their patients, and while machines turn out things thousands of times better than they did years ago, it is also true of Mr. Taylor and his work; that is right, that is the proof of this conglomeration that I showed you. From my point of view it is disharmony; that is the way that I have sometimes, we haven't got the same kind of spirits around the house, with my wife.

But that is the way I approach the subject, so that when I finally get to these things that affected the men, they have confidence in me, and I do not know a single instance—there were rumors around the Link Belt Co. that I had been working on, that they told Taylor, but they didn't tell me. I was told that they were going to kill me; I wasn't told that by accident, because everything that is bad around a plant—when I came around they would say "That is the reason," so that I was the scapegoat for everything that happened. You know people used to believe that God ran the world, and everything that went wrong was his fault, and that was the case here; there has always got to be a scapegoat. Of course, people don't put it that way, but when you analyze it, that was the reason, that God was always the scapegoat.

Now, just to show you how I can gain the friendship of men that way, I mention a case where this company here in the Middle West set to work to test tool steel, as we had done before often, and there was an old Swede who ran a machine for 15 years, and he was amazed at what we did. They had high-speed steel on the market for 12 years, but in this plant they did not know how to get it, except in one corner, and it did not go across the street, in the same plant, and when we got through with that thing, from the very beginning he saw things, and he was pleased—he was an exception that way—but from the very first minute he was pleased with the things that he learned, that he did not know anything about before, and it is deplorable that every machinist in the world does not know it to-day.

So much for that, but when we got through he asked to have a photograph made of the lathe with the test tool in, and with the instruments that we measured with, and among other things the stop watch, because we find the sun dial too crude for these things, and we have got to use a stop watch. Well, at first he got a picture, but he did not altogether like it, but here it is [exhibiting picture]. He said, "Barth, no; that is not what I want; I want you in the picture." So reluctantly—I am not very proud of my mug—I reluctantly consented to this, and tried to hide myself as much as I could, and it was simply pathetic to see how he valued that picture. And here it is [exhibiting another picture].

It was simply wonderful to him, the way we ran that lathe, and the way we speeded it and fixed it up and overhauled it for him, and the result we got. He was simply tickled to death, except that he forgot to die on top of it.

And it is the same way with the man that went that day to help me in testing drills, the next day when the drill manufacturers were present—I will mention here that we conducted the tests in tool steel in this plant where we had 15 men, representatives of 12 drill companies, present during the last two days, and the tool that won was admitted by everybody to be the best tool steel made. I knew that problem so well that I could swing these fellows on the outside, so that they were ready to beat each other up, and there was not a man that did not go away satisfied that everything had been done to show up the best in steel. I said, "Gentlemen, take your hat off, and take it off to Dr. So-and-so"—he was the man that made that tool steel.

I got an operator on the second day whose name was Emerson—he wasn't a relative of our friend Emerson here—and I said "Do you realize that you never knew anything about drilling before," and he said, "yes." I said, "Well, let us review it." I said, "Here is a representative of the drill steel company, and he thought he had to reduce the speed because he did not get results, and you agreed with him, and you proved that we did not get it when we increased the speed." Every time there was any trouble the ordinary man would reduce the speed, but unless you give certain things a certain amount

of things to do it will not do anything hardly. It is like human nature, you have to give a busy fellow plenty to do and keep him pretty busy or he will get into such a habit that it will be a bad thing. You must keep him up to a certain standard, and if you do go too fast you burn it out in a machine, and so you will in a man.

I am a scientific man and an engineer, and I am entitled to the title, because I took the greatest possible care to find out the limit of the machinery in the cutting of tools, and I insist so far as it is in human power that the very same thing is done in finding out what a man can do, but unfortunately that job is too big, I can not do it all. I must turn it over to other men and instruct them and admonish them, and tell them, as I have always told them, "Remember the first thing it, if there is a doubt, to give the man the benefit of the doubt. I want you to realize that." I do not say that everybody does that; they may forget it, but that is the spirit that Mr. Taylor has inculcated in me, and it has all come from Mr. Taylor. I come from a long line of ancestors that raises hell once in a while. But we want to do a fine piece of work for the world, to the best of our ability, even if it is only one little bit of brick. You people are trying it, I suppose, to the best of your belief, and we are trying to do the same thing. There is no use of our pretending that we succeed always. Mr. Taylor sat here yesterday, and spoke about these things as if they were always an accomplished fact, and he spoke as if he was working night and day and spending money for the realization of his ideals. Now, I do not care to rap about millionaires; I would rather see them drowned, but we have not considered that we have a right to do that yet, but the time may come when we will do it in some way or other, I don't know.

Now, then, he can not help looking at these things a little too ideally, so far as accomplishment is concerned, but it is the spirit and not the absolute accomplishment. That is what Christ himself says, and I think it is a very fine thing, not because he said it, but because it is true. I don't care who says things as long as they appeal to me. It is for you to find out to what extent some of these things have been accomplished, or what has been accomplished that they intended to do, and it is only the ordinary human failing and the overambition of a lot of people who think they are especially fitted to do this work in some cases. I never thought them fitted, but some people have made me do it, I think against my better judgment; but I went at it in such a way that I got convinced that I can do some things pretty well anyway, but the other fellows told me that I was fitted to do that work; some people think that they are especially fitted for it, but they make this mistake—the desire to make big money from that ability to do the work—and that is a mistake, and it shows up again and again by the enormous number of failures there are in the country. You talk to some people about efficiency and they run you out. They could kill a fellow who comes around and says that, because of their experience with others. That may not be in all cases the result of the efficiency engineer, because there may be some fellows on the inside, but again and again you will find lots of fellows who will not admit that they tried it and found it a failure; who will not admit that they have been taken, and if you are after truth and facts I will give you some little line to work on.

Our people at home say, "For God's sake don't talk that way," but I can't do otherwise; no matter how many devils there are, you can always go and tell which you fought. I also want to say something about soldiering in shops. There have been no facts brought out here to-day or yesterday to prove that there is soldiering going on. I have any God's number of evidences about that, but as with that, so it is with everything else in the shop—it is the management's fault. I told the last investigation commission—and if you read it I will not repeat it, but the rest of the public may be interested in hearing it, because this is a public hearing. I do not know what that means myself, except that there is a public hearing, and we will put that interpretation on it, anyway.

I investigated one shop in New England, and went around with the foreman for three days. There was the most deplorable conditions, from the modern point of view, that I ever saw. Nothing was right in that shop. I came around through the shop with the foreman behind my back, and came up against a planer working. His eyes were apparently riveted on his work. He was apparently doing a wonderful work. At a distance the foreman imagined he was very busy. He would come along and see this man making those motions, and then go off somewhere else and see somebody else at work. We happened to almost sneak up behind him—not intentionally, you understand. I wanted to see the work. I was studying the work there—the

finishing and the other things. This was the most wonderful work in the world, so I was told. Everybody does that kind of work. Everybody has that idea until you find out what other people do. There was absolutely no cutter in that machine. Mr. Dodge knows those things happen. I did not know what to do. I did not want to inflict that awful mortification upon the poor man, so I looked at it and passed on.

The man must have felt awful. He did not know whether I was a mechanic or not. When we went away I said nothing. I suppose he thought "Oh, well, that is one of those fools that don't know nothing." But I mentioned that in the evening when I gave a talk to all the men—the foreman and the employers. The big bugs were all there. I said: "I want you all to understand this." I told them this man had said he had loafed in order not to make too much money, because "the minute he does you pounce upon him." I said "Don't go down and find fault with your foreman or with that man. It is your fault." I spoke that way to them, and I spoke of a good many other things. I talked to them pretty straight, and, my God, they needed it. There was one instance of it.

I saw a man come down from one of the departments away off carrying a casting. They were working in the old way of the shoemaker, the fellow was making all of the shoe—everything about the shoe. We had certain machines for this particular kind of shoes that he did not have. That fellow, personally, goes from his department down to the planer department where, as luck would have it, that planer was available, and he gets the planer going, and, probably, it took him 20 times as long to do that as it ought to.

Those things are criminal when you know better. When you don't know any better, of course, it is all right. The minute you know better it is wrong. As an engineer it is my duty, when once I realize it, to do all I can to increase the production and to utilize the equipment of production—to perfect it as it has been given to me. The man that does one little thing better than anybody else does it is just a little bit tickled over it, even when he lays down to die.

There is no question about Mr. Taylor's system. He has common sense. You can not pay, on the whole, a wage earner more money unless you can increase his productiveness. You can do it in isolated instances. There was a case cited here of two competitors, one making 5 per cent and the other 45 per cent. Of course, the 45 per cent man could pay more than the 5 per cent man. It is a drop in the ocean when you take work generally out over the country.

We are living better to-day than we used to because we are more productive; and, by jinks, we have not begun, as Mr. Emerson said, to utilize our reserve forces.

I believe in a personal mission. I believe that there are enough men in the world to do these things, and who are willing to sacrifice their individuality to aid in the advancement of all mankind. I know I could do that, and I am no better than the rest of you. I am just a very ignorant cuss, by jinks. Here is a millionaire, for instance, and if he knew how to give all of his money away to do some real good, great God, it wouldn't take 5 minutes to get him into this lodge; but he don't know how to do it. Lyman Abbott said: "If I had \$1,000,000, I wouldn't know how to spend it to-day." History has shows that when you spend a large amount of money to correct evil, it turns around and increases that evil. That is too much for me. I am awful glad I haven't got a million.

I guess that is enough. If you wish to ask me some questions, I can always answer questions, God knows—good questions, fool questions, and any kind of questions. If I have not succeeded in giving you anything worth while, try to pump me now.

Commissioner O'CONNELL. How about the nonproducer?

Mr. BARTH. We haven't any nonproducers. I will not admit that for one second. We have indirect and direct workers. When I sit in my office, doing all kinds of things, I am working in one way, and I am working like hell from morning to night, too. I will not stand for a minute for a fellow to come and call me a nonproducer. We will have a scrap about it, by God, if he comes too close to me. You want to forget this idea about producer and nonproducer.

Commissioner O'CONNELL. Do not we have them in society as a whole?

Mr. BARTH. No; we have parasites. Those are the nonproducers that eat without work. I don't know what you have observed about that, but probably not very much, from your question. That shows how little we have absorbed

the spirit of the Bible, because it says, if you don't work you shall not eat. Some of these fellows think too damned much about eating, and don't work a bit. We have parasites all around, and we want to get rid of them. They have no place in our system.

Commissioner DELANO (presiding). Mr. Garretson, have you any questions?

Commissioner GARRETSON. No; thank you.

Commissioner BALLARD (presiding). Commissioner Weinstock, have you any questions?

Commissioner WEINSTOCK. I was not here during the early part of your talk, so I doubtless missed a good deal of it.

Mr. BARTH. You surely did.

Commissioner WEINSTOCK. I was told I missed a circus.

Mr. BARTH. That is all I consider this thing, anyway—just a circus.

Commissioner WEINSTOCK. It is suggested to me that it is a wise man that stays out of these things, but I am going to be foolish enough to enter upon a question or two. You have been here a couple of days, and I suppose you have got the drift of this whole thing more or less?

Mr. BARTH. Yes. It was awful sometimes, but I guess I got it.

Commissioner WEINSTOCK. Among other things that have been brought to the attention of this commission is the matter of scientific management. This commission, in its report, will more or less be expected to say something about that. In the course of our investigation we have had more or less objection made to scientific management, more especially on the part of organized labor.

Mr. BARTH. I know all about it.

Commissioner WEINSTOCK. As one who has had long experience in dealing with the problem, and as one who is an authority, and who is an expert—

Mr. BARTH (interrupting). I beg your pardon; I do not believe there is any authority for this work.

Commissioner WEINSTOCK. I will modify that at your suggestion and call it alleged authority.

Mr. BARTH. That is all right; I will accept the amendment.

Commissioner WEINSTOCK. We would like to get your point of view and your opinion as to the objections that were raised on the part of organized labor against the scientific management. In the first place, the claim is made that scientific management increases productivity, but does it at the physical expense of the worker.

Mr. BARTH. If it did, it would be wholly unscientific; it would not be scientific at all.

Commissioner WEINSTOCK. It would not?

Mr. BARTH. No. Mr. Taylor suggested it would kill the golden goose. Some people do that. We know that.

Commissioner WEINSTOCK. From your experience and observation you would not admit that real scientific management means reducing the vitality of the worker?

Mr. BARTH. I admit it just as well as I admit that the moon was made of green cheese, absolutely.

Commissioner WEINSTOCK. The next charge that is made against it is that while scientific management may temporarily increase the earnings of the worker, in the long run his earnings are reduced.

Mr. BARTH. It has not run long enough to prove that. That is only guesswork.

Commissioner WEINSTOCK. Up to this time it has not?

Mr. BARTH. I have not seen any of it. I said some other things about that, and there is no need starting the circus performance a second time. You can read that to-morrow.

Commissioner WEINSTOCK. Up to this time you would deny the charge that it tends to cut the earnings of the worker?

Mr. BARTH. Scientific management? Oh, there is a lot of alleged scientific management that is an outrage to industry to-day, and I insist upon that.

Commissioner WEINSTOCK. The next objection raised to it is that it destroys collective bargaining.

Mr. BARTH. As I have never seen collective bargaining, but I have only heard of it, I can not say anything about it. I can not understand how a thing can be destroyed that I never saw myself. That is all hearsay. I never met this. I had talks with a lot of people about it. They started to heat me up, and when they did that I said, "Here, we part, because that is something I feel I could not deal with."

Commissioner WEINSTOCK. Do you believe that organized labor is a good thing for the laborer and a good thing for society?

Mr. BARTH. As I have never been near them, I have not much opinion on that; but from what I hear other people say—I can not help absorbing things, though I do not like to spread it out that way, for fear of faultfinding—there must be something of that kind in the air, just the same as scientific management. These people call it democracy. I never was a politician. I come from Norway, you know, where they don't have politics, and still I have been told much about those things. I do my daily task, and I set it myself. I don't need any task-maker for myself. My task is harder than anybody will give me, God knows. I don't bother about those questions until they come to me, and I feel if I have time enough to give anything attention I am entitled to a real opinion before I express it. You ask me what I think about it, and I will tell you I am too busy to think about it, and expect to be until I die. I did all the thinking I could when I was young, and I don't propose to waste another five minutes in that fashion. I am not going to waste five minutes on the labor-union question until they come to me. If I am called in on something and they say, "We are unions," I will say, "What about it? What about it?" We meet, get together, and have a talk with the labor leaders, and I am glad. How it will come out I can not tell you. If they want to be fair and square, I can tell you how it would be. In my opinion, they rank as a set of biased fools that would simply make use of me and waste my time on it, when I should put to advantage all my time as long as I can live, no matter how long I live.

Commissioner WEINSTOCK. You doubtless have explained to the other commissioners during my absence how the bonuses are arrived at.

Mr. BARTH. That is a thing I am just aching to show you, because all along since I have been here they have been talking about that for two days. I undertake to explain to you the meaning of premiums and bonuses and piecework, and why? Because when Mr. Halsey, the inventor of the premium system, got the invention I was working side by side with him 20 years ago, and I have been around the business, except for a period of time when I was not there, for some years. I was with Mr. Gantt when he devised his bonus system at the Bethlehem Steel Works 15 years ago. I was not with Taylor when he invented piecework, but I guess you can imagine it was not difficult to find out what his plan was. There are unquestionably three ways of paying men, and they do not consist of the true system. I had to laugh at the absurdity of a question asked by one of you commissioners the other day—what is the difference between the premium system and the Taylor system? Why not ask what is the difference between the earth and the universe? I do not ask that kind of fool questions any more.

They had a number of my countrymen working in the shops, that they any day make \$10. I did not dare make more than five. How did they handle the thing—because William Sillers & Co., like everybody else, did not give the men a job at the time, but they spend so much time on it and so much money. They gave them a bunch of tickets, and a man might be working for a long period of time, and he simply took time from the factory, and he averaged in such a way that he did not exceed the limit. But unfortunately there were some human hogs, from the point of view of the workmen, who once in a while would show us how to take the fat rate. They would make the fat rate and then skin out and then go elsewhere and take the fat rate there. That was called spoiling the rate. So in the course of the years the plan nearly always reduced the fat rate, but they never got a chance to increase the real rates. The workmen would say, "Now, I have done so and so. For God's sake take the time off and put it in." That feeling was bad, and we are trying to create a better spirit, and we have done so to-day to a greater extent, so that I have seen that terrible defection, where I have seen it in the old country, men loafing in the navy yards, and after dancing all night I have gone in and slept in a boiler all day. [Laughter.] I heard an awful lot about it, because so many of my countrymen worked in shops in Philadelphia, and those shops there were considered easy shops. I know how the men deceived their employers and themselves. If a man gets \$10 a day, and he does not make more than five, just cut it, that is all. Now, Mr. Halsey says that I am going to show that I can do something better than that. He will simply go to work and select a certain length of time that it takes to do certain jobs. We will give up this baneful piecework that might have been erratic, and we will say simply, "The last time this job was done it took 10 hours, and we will just guess at it that if it

was done in 10 hours it could have been done in 8 hours easily." They first chipped off a couple of hours, and they told the man, "If you beat that, we will give you half the benefit, and we will have half the benefit." Mr. Halsey said one-third. Most people said one-half. So that we took the man who had a time limit of eight hours and he did that thing in four hours, which Mr. Halsey did not object to at all.

You take that system and a man will get six hours for four hours' work. What happens? The last man let himself out. They were told that there would not be any trouble about doing that thing; they would not have to meddle with that. The men made such enormous money that the fool of a manager came around again and cut that, too, and that is where all Mr. Halsey's disappointments came in, that he thought he was going to benefit the manufacturers and the workmen by this system, and he found it was just as bad as the piecework. Now, Mr. Halsey invented that system, and it was one of the disappointments of his life. He did not know anything about planning in the sense in which Mr. Taylor has carried it out. Long before Mr. Taylor had taken up his work with the Midvale Steel Co. he had arrived at the conclusion that guesswork will not do.

It must appeal to anybody that finding out by the best methods we can resort to really the length of time that it takes a man to do a job is the only basis on which you will put a task on the limit. All these things are tasks. They give you \$2 a day there, but you have got to do so much work in a day. Even those workmen have a limit. The task has not anything to do with that. We use any one of a number of systems of putting a man on top of the task, and that is what we want to do to determine the task. What is the proper task for a man in a day? Why do we use the stop watch? Because the sun dial will not do. The sun is not up all the time. The stop watch does not get near enough sometimes. We can't get at the time on certain small operations, even with an ordinary stop watch. We will have to have an instrument to make it finer. So that you see here what was the baneful thing of the old piecework system, and the baneful thing on which we hope for improvement, that there were guesses behind the whole thing. Mr. Halsey thought that no matter how bad that was, the manufacturers would get so much more out of it that it would not disgust the man with what he got out of it, but it did. He came around and said, "That man can not have that much money. He will be as rich as I am in a little while." Now, there has been a little friction, I think, between Mr. Halsey and Mr. Taylor. Mr. Halsey, because he managed to publish that before Mr. Taylor did, felt a little sore. Mr. Taylor claimed that he had invented his differential piecework system before Mr. Halsey did that. But now Mr. Halsey is disgusted with the results, anyway, so that I do not think he cares to claim anything any more. If a thing turns out badly, nobody cares to claim it.

Now, let us figure out how this differential piecework system is. Now, remember that Mr. Taylor, by necessity, is changing his views. Of course he is. Who can work for 35 years without changing his views? To read his books like some of you fellows have done here is to read them like the devil reads the Bible; he read it backward. Of course, he couldn't get any kind of meaning out of it. You know, one time they put 60 fellows together, I have been told, to study, and they prayed that the Holy Ghost would enlighten them, so that they were all studying in a cubby-hole—

Commissioner LENNON. Stop; I tell you, I am not going to listen to this. It is not pertinent to the subject of the inquiry.

Mr. BARTH. That is perfectly right. I am ready to be sat on any time. But I only wanted to say that the Holy Bible is not to be read in that way.

Mr. Taylor, then, by all the means that he could lay his hands on, went at this. Suppose that a man took 10 hours to do a job, and suppose that man got 30 cents an hour. If he did that in 10 hours he would be earning \$3 a day. That is a task, you say. It is enough of a task to warrant paying that man himself his day wages; and suppose we take for simplicity one-third, which is the average machine shop, and should be that in the shop. He says, then, "I will take and add one-third of that, which will be a dollar, and that will be \$4." He will pay that high rate for the job—of \$4. If the man did that inside of 10 hours, he got \$4. But if that man failed to do it in 10 hours, he said, "I will give him a certain part of that." But the part which was more than the day wages, in case he did not fall down very mate-

rially, he got. In adopting that method in Mr. Dodge's place he does not say so, but it is a bonus. I can tell you more about his shop than he can. He has there a differential piecework for most of the work. Now, you take and divide that by five-sixths, and you will find that if he misses it only by an infinitesimal part he will still get it; but if he misses it badly he still gets his piecework. If he did not do anything he would still get his day wage; but that high wage is paid for turning out a certain thing in a certain time.

Commissioner WEINSTOCK. Is he not guaranteed a certain wage?

Mr. BARTH. No, sir.

Commissioner WEINSTOCK. I understood that under the Taylor system in any event a man got his daily wage, with a plus if he exceeded a certain production.

Mr. BARTH. That has nothing to do with the Taylor system at all. That is one way of paying him wages, but it has nothing to do with the Taylor system at all. I am glad you asked that, because the Taylor system is a thousand times bigger than any one way of determining to pay a man. He went into that like lots of other things; but you can use a part of this invention and not the whole of it. What is the objection to that in the minds of some people? That you have got to be so dead sure about those 10 hours most of the time the manager will not give the extra time enough to standardize conditions sufficiently to get so close to that that a man like myself likes to commit himself to that.

In the shop at Bethlehem for the time study an intelligent guess was near enough. You only want to make five-sixths difference in the men's pay. So Mr. Gantt invented his bonus. Isn't that so, Mr. Gantt?

Mr. GANTT. There was not a bonus invented there, but what was invented there has not been in use for 10 years.

Mr. BARTH. No; I do not say what was there; but it is to go and create the use of high-speed steel, and we set a reasonable task that we were willing to swear by; so that Mr. Gantt one day woke up with the idea that they would do that; but I said, "We have got 10 hours"; and then they say, "Any man that does that inside of 10 hours will get that extra dollar." That was his bonus. If he fell down he would get his day wages. Now, Mr. Gantt has since modified that thing; but that was what he invented; that was the Gantt bonus, was it not?

Mr. GANTT. Yes.

Mr. BARTH. Now, I do not care to go any further. There are a thousand systems. Every Tom, Dick, and Harry wants to invent something that he can attach his name to. I invented one myself, but I never said anything about it except to my son. I do not propose to use it. I think it is a little better than some, but I don't want to put out one more to flood the market. [Laughter.]

Again, do not imagine for one moment that the Taylor system is any one of those things. We apply any one of those, and lots more are applied by the other fellows; but what we are after is, by the best means we can find, to determine how long it takes to do a job, and then any one of a dozen ways can be invented to do substantial justice on top of that; and, for God's sake, don't waste any time on what is going to be done on top of that. Everything else fails on account of not being able to get at the time.

We use the differential piecework, we use the bonus, and we use the other systems, according to the conditions in the shop and the sentiment. Some people hate piecework and so they take a certain bonus system, and it is absolutely the same thing in his pay envelope. Now, I do not do that myself. I do not consult anything that looks different from what it really is. If there originally was one way of looking at a certain thing, if the same thing comes up I do not want another name for it to confuse us.

It has been said that the guesses that were made at the length of time it takes to do a job were made by watching a man, or by sneaking up on a man and watching him. That was the old method.

Commissioner DELANO. We must adjourn now. We will adjourn until 10 o'clock to-morrow morning.

Mr. BARTH. Will you want me again? No? I will be here.

The ACTING CHAIRMAN (Commissioner DELANO). Will you be here anyway?

Mr. BARTH. Yes.

The ACTING CHAIRMAN. There may be some questions arise.

(At 6 o'clock p. m. the commission adjourned until to-morrow, Wednesday, April 15, 1914, at 10 o'clock a. m.)

WASHINGTON, D. C., *Wednesday, April 15, 1914.*

The commission met at 10 o'clock a. m. in the assembly room of the Shoreham Hotel.

Present: Commissioners Frederic A. Delano (acting chairman), John R. Commons, Mrs. J. Borden Harriman, Harris Weinstock, S. Thruston Ballard, John B. Lennon, James O'Connell, and Austin B. Garretson.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. B. M. Manly, superintendent Division of Industrial Investigations; and Mr. F. H. Bird, superintendent Division of Public Agencies.

Commissioner DELANO (acting chairman). The commission will come to order. The commission has a good deal cut out for it to-day. Mr. Berres, secretary-treasurer metal trades department, American Federation of Labor, will be the first witness.

Mr. Sanford E. Thompson, of Newton Highlands, Mass., will come next, and Mr. N. P. Alifas, of Washington, and Mr. H. L. Gant, of New York.

Mr. Brandeis, who was held over from Monday, will not appear until tomorrow afternoon.

I will ask Mr. Manly to conduct the examination of the first witness, Mr. Berres.

TESTIMONY OF MR. A. J. BERRES

Mr. MANLY. Mr. Berres, will you please give your address and business to the commission?

Mr. BERRES. I am secretary-treasurer of the metal-trades department of the American Federation of Labor. My office is at 513 Ouray Building, Washington, D. C.

Mr. MANLY. In your official position you have been brought into contact with what is called the systems of management?

Mr. BERRES. Indirectly.

Mr. MANLY. In what way?

Mr. BERRES. In this way, receiving protests from organizations working under the different systems.

Mr. MANLY. Have you investigated those protests—followed them up?

Mr. BERRES. I might answer that in this way, it would be impossible for us to make an investigation of all these protests personally. In some of the plants that some of the gentlemen have enumerated in which these systems are installed or where they are attempting to install them I really do not know what would become of a representative of labor if he would approach that management and ask that he be permitted to make an investigation.

Mr. MANLY. But it has not been from those plants that your protests have been coming?

Mr. BERRES. No; the protests that have been coming to us have been mostly from men employed in the Watertown Arsenal.

Mr. MANLY. In the Government plant?

Mr. BERRES. In the Government plant.

Mr. MANLY. May I ask what trades particularly have been making protests?

Mr. BERRES. Largely the machinists and the molders.

Mr. MANLY. In order to bring out definitely your ideas with regard to the systems of management, will you give us briefly your understanding of the principal features of the system with regard to which you are going to speak?

Mr. BERRES. I want to say in the beginning, Mr. Chairman and gentlemen of the commission, that we are not opposed to efficiency.

Commissioner WEINSTOCK. When you say "we" you mean organized labor?

Mr. BERRES. Organized labor. To be brief, I think I ought to say that if the men who are supposed to work under any of the systems had the opportunity to sit down and have the system explained to them much of the difficulty would be eliminated. The mere fact, even in the Government service, of the Government having an outsider come in in order to install a so-called efficiency system immediately invites the suspicion of the men, and in my judgment if efficiency would come from within there would be less opposition to it. I believe that is one of the great troubles with the installation of the systems.

Next, the men feel if it has been necessary for the management to go outside to get some one to come in to tell them how to run their business, that there is something radically wrong, and that they might expect a great departure from the method of doing business that they have been used to, and in order to eliminate that suspicion, if the men were given an opportunity to listen

to what the system consisted of I think much of the difficulty would be eliminated.

I want to follow that up by saying that I think there is a great chance for not only bettering the conditions of the workers, but of improving the methods of manufacture and lessening the cost of the manufacture of many articles, and in lessening the cost, so long as it does not interfere with the workers' status, as relates to hours of labor and general conditions, we should not offer any opposition that I can see.

Mr. MANLY. You believe, then, that an increase in productivity is a good thing?

Mr. BERRES. Certainly.

Mr. MANLY. That is, it provides the means for increasing prosperity, that the whole question comes down to two fundamental issues: First, exactly how the man is affected in increasing his productivity and, second, how the increase in productivity is distributed?

Mr. BERRES. Yes.

Mr. MANLY. In order to bring those down more definitely there are several fundamental features of the systems of management, and in order to get it to an issue I would like to go over those one by one to show which features are the ones about which you think the men can be properly concerned and as to which they need either explanation or modification.

From the management end there is, first, the planning and the routing of the work. There is no objection to that, is there, from the point of view of the workmen?

Mr. BERRES. I have not heard any opposition to that.

Mr. MANLY. As a matter of fact, that feature of the work can very well be to the great advantage of the workmen?

Mr. BERRES. I think so.

Mr. MANLY. The second feature is the standardization of the work by means of definite time study. What would you say in regard to that?

Mr. BERRES. That is a question that I think the men should have an opportunity to study and to express themselves upon.

Mr. MANLY. As a broad general proposition, do you see any objection to getting definite, precise knowledge of how much time the work should occupy, properly fixed?

Mr. BERRES. Mr. Chairman, I think we ought to find out how that is going to be determined. If I might at this point say, a great deal of the most serious opposition that has come to our notice has been the fact of the use of the stop watch. I do not know whether that could be eliminated or not, if the men had an opportunity. From what I have learned from them, there seems to be a positive stand against the stop watch being used to measure the time.

Mr. MANLY. On what is that opposition based, as you understand it?

Mr. BERRES. I think the best way to view that question would be for the man of the management to put himself in the same position that the workman is placed in. I do not think that any man, any young American at least, wants anybody to start him off with the watch and stop him with the watch. I think it immediately invites antagonism of the men.

Mr. MANLY. By starting him off with a watch and stopping him with a watch, just what do you mean?

Mr. BERRES. The fact that some one stands right close to the man with a watch in his hand.

Mr. MANLY. You do not understand that that is a constant practice, that that is done every time a man performs a job?

Mr. BERRES. No.

Mr. MANLY. That is only upon the original time studying.

Mr. BERRES. That is the way I understand it.

Mr. MANLY. At the time the schedule is made. In making a railroad schedule, for example, how would you make it, except by timing the beginning of the journey and taking the end of the journey?

Mr. BERRES. I think that is an entirely different proposition, and it does not always follow that the end of the journey comes at the time the schedule specifies, either.

Mr. MANLY. No; but there is a schedule.

Mr. BERRES. Yes; there is a schedule.

Mr. MANLY. The objection is to the use of the stop watch, or is it to the general proposition of knowing exactly how long the work should occupy?

Mr. BERRES. It seems to me it is to the stop watch. But there are any number of different ways in which men could find out how long it would take to do a job, and whether the man was doing it right or wrong.

Mr. MANLY. If the total time for a task was measured with an ordinary watch, would there be any objection to that?

Mr. BERRES. I can not see very much difference. As a matter of fact, I do not know whether the man would know whether it was a stop watch or an ordinary watch.

Mr. MANLY. Any sort of timing is objectionable, is it?

Mr. BERRES. That has been the general opposition to the installation of the system, that men did not want to be placed in that position, where they are going to be timed.

Mr. MANLY. Do they not time themselves when they want to catch a train, to find out just exactly how much time they have got to get the train?

Mr. BERRES. It would be natural to suppose that they would. That is not having someone else do it, though.

Mr. MANLY. One of the other fundamental features of the system of management is the payment of men in proportion to their productivity, either by means of task work, a bonus, piece rate, differential piece rate, or one or the other of the various systems. What would you say with regard to the use of some such system of payment?

Mr. BERRES. I might answer that in this way: I think every one of our international organizations is on record in its constitution as being opposed to anything except the straight time system of payment; and as nearly as they possibly can, they follow that out, so that we have always felt that that was the way in which men should be paid, and we have not changed from that position at this time; so that anything I might advance in that direction would not be of value, I think, because we are opposed to anything of that nature.

Mr. MANLY. Unalterably opposed to anything except the straight-time system?

Mr. BERRES. Yes.

Mr. MANLY. Your organizations do work under piece rates, do they not?

Mr. BERRES. Some of them.

Mr. MANLY. Are those piece rates all equitably fixed? I mean are there not lean rates and fat rates among them?

Mr. BERRES. That is a question that I could not answer. Those agreements or decisions are reached by the organizations directly involved, and I have not had the opportunity to witness the making of such an agreement, or the fixing of such prices. I judge that if they are in existence, they are satisfactory to the men who made them, under the conditions.

Mr. MANLY. You have had shop experience, have you not?

Mr. BERRES. Yes.

Mr. MANLY. In your shop experience you have never seen anything of the existence of fat rates and lean rates?

Mr. BERRES. No; none whatever. I might say that I am a pattern maker by trade, and I have never yet seen where the installation of a system such as we have heard spoken of here has been tried, or where an effort has been made to apply it. That is because there is very little duplication of the work.

Mr. MANLY. In what branches of the metal trades do you foresee that there is likely to be a development of such system of management, or a tendency to put it into effect?

Mr. BERRES. The machinists, the molders, the boiler makers, and the blacksmiths, I think.

Mr. MANLY. From your experience in the shop, and from dealing with managers, you have formed some idea of what constitutes an efficiently-managed shop, have you not?

Mr. BERRES. Yes; from my own point of view.

Mr. MANLY. Would you mind telling us what you consider an efficiently-managed shop, and how the efficiency in such a shop is best attained, in your opinion?

Mr. BERRES. First of all, I would have the most improved machinery; secondly, I would have it located at the most convenient places, so that all the men could get to it in the least possible time. I would have the best kind of materials for the men to work. In my shop practice I have noticed that there seemed to be very little judgment used in the placing of machines. Of course,

our business is almost entirely different from any of the other metal trades. For instance, the machines would be halfway down the shop. That is, they would be half the length of the shop away from the first man, so that any time he wanted to use either one of them it would consume that much time going and coming; whereas, if the machines were placed in the middle of the shop, at least, where all the men could have easy access to them, there would be much time saved.

Mr. MANLY. A great deal of the efficiency of the shop would depend on the grade of workmen that you employed, whether they were good, capable men, would it not?

Mr. BERRES. That is very necessary, if you want to see efficiency.

Mr. MANLY. How would you select your men?

Mr. BERRES. The way that they are usually selected; they are taken into the pattern shop and are worked for a reasonable length of time at what we term "second class," and then if they prove their value they are increased in a reasonable time, usually 60 days.

Mr. MANLY. On what basis are those increases in compensation made?

Mr. BERRES. From the character of the work.

Mr. MANLY. From the character of the work? By that you mean quality?

Mr. BERRES. Quality, in a way. There are patterns and patterns. There are patterns that almost anybody could make, and there are others that take the finished mechanic to execute.

Mr. MANLY. It would depend entirely upon their ability to make—

Mr. BERRES. To make anything.

Mr. MANLY. On their ability to make the more advanced or more intricate patterns?

Mr. BERRES. Yes.

Mr. MANLY. You would not advance men at all on the basis of the facility that they had in making patterns rapidly? You would not make any difference between the slow pattern maker on the same class of work and a rapid pattern maker?

Mr. BERRES. I think if I was an employer I should certainly consider that phase of it—certainly.

Mr. MANLY. Yes; I thought you would. How would you arrive at the idea of which was the fast pattern maker and which was the slow pattern maker?

Mr. BERRES. I have never seen a pattern shop yet where they did not keep the cost of the job by a card system. A man makes out a card every day on the job on which he works, the amount of time, and that goes to the office. So it would not seem to me to be very difficult to take another similar case, if there was another similar job, and see who was the fastest man; and then if a man paid strict attention and gave close application to the shop, which they do in a pattern shop, because there are never very many pattern makers in a shop, he can certainly distinguish as to which one of two men working on the same job is carrying it on in the best manner.

Mr. MANLY. In your idea of an efficiently managed shop, who would decide on whether the man was a fast man or a slow man? Would it be up to the foreman, or would you have the management look over the cost sheets and determine it in that way?

Mr. BERRES. If it were me, I should leave it entirely to the foreman.

Mr. MANLY. You believe in the fairness of foremen generally?

Mr. BERRES. I certainly do. I think a foreman has that degree of interest in the shop, as a general proposition, so that he is going to select the best men, when it comes to a time for discharge, for his own protection, if for nothing else.

Mr. MANLY. Because ultimately his advance depends upon the productivity of his shop?

Mr. BERRES. Certainly.

Mr. MANLY. You really in the long run pay a man in proportion to his productivity, do you not? That is, the man that makes the biggest output and does the best work at the same time would naturally be paid a differential rate?

Mr. BERRES. Well, you might make that statement in the broadest sense. As I said, we never work on piecework, and there are fixed rates for these classes of men, and if you call that paying the most for the increased productivity, why I say yes.

Mr. MANLY. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Garretson, have you any questions?

Commissioner GARRETSON. Do you not believe that the objection of the average man or the average mechanic to what is generally termed here the stop watch, whether it is a stop watch or some other kind of a watch, and to the methods that are described in the various efficiency or scientific systems, lies very much in the fact that the man who feels within himself the power to successfully perform the duties of the trade to which he belongs, that he objects to being made an automaton and a cog in a wheel?

Mr. BERRES. Yes.

Commissioner GARRETSON. The destruction of the individuality in those directions, while dwelling on the individual factor in the dealing?

Mr. BERRES. Yes.

Commissioner GARRETSON. From the standpoint of the men, if carried to its perfection, would it not result in the elimination of a large part of the initiative that the American workman is supposed to possess?

Mr. BERRES. Certainly.

Commissioner GARRETSON. The suppression of the incentive faculty?

Mr. BERRES. Yes.

Commissioner GARRETSON. Or the pride of being able to do a thing better than another man?

Mr. BERRES. Yes.

Commissioner GARRETSON. From your standpoint, do you believe that as long as the apostles of these various systems bitterly disagree as to which is the method, that it is any wonder that the body of the men will not accept any one of them as law and gospel?

Mr. BERRES. None whatever.

Commissioner GARRETSON. That will be all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Weinstock, have you any questions?

Commissioner WEINSTOCK. As I understand it, organized labor stands for the minimum wage, does it not?

Mr. BERRES. Yes.

Commissioner WEINSTOCK. A minimum wage that shall insure a living wage?

Mr. BERRES. Yes.

Commissioner WEINSTOCK. But it has no objection to a maximum wage; that is, it has no maximum?

Mr. BERRES. It has no maximum.

Commissioner WEINSTOCK. It has not the slightest objection to the employer paying as much above the minimum as the employer is prepared to pay?

Mr. BERRES. None whatever, sir.

Commissioner WEINSTOCK. In other words, while there is a minimum, there is no maximum?

Mr. BERRES. No, sir.

Commissioner WEINSTOCK. Now, imagine that you or I were working side by side in a shop, and we both started in at the minimum wage. And imagine further that you were an efficient worker, and I was just the average worker; that I was worth the minimum, but no more; but you, by virtue of your initiative, by virtue of your speed, by virtue of your higher intelligence, by virtue of your industry, produced more than I did. Would you or would you not feel that you were entitled to more than the minimum wage?

Mr. BERRES. Well, I would feel, of course—we often feel that way, but there is the possibility that the man in charge does not feel that way.

Commissioner WEINSTOCK. No. I am not asking you to tell me how the man in charge feels, but how you would feel.

Mr. BERRES. I say we would possibly feel that way, but nothing comes of it.

Commissioner WEINSTOCK. Please answer the question directly. My question is, if you should prove to be much more efficient than I, would you feel—not what the boss would feel—that you ought to be appreciated, and, therefore, that you ought to earn more than I was earning; that you were entitled to receive more than the minimum?

Mr. BERRES. Certainly; I think anybody would feel that way.

Commissioner WEINSTOCK. And if you did not get more than the minimum you would feel that you were not getting a square deal, would you not?

Mr. BERRES. Yes. You will let me qualify that. If there was in that shop a higher rate—if there was a high rate already established—

Commissioner WEINSTOCK. No. Many shops have only the minimum amount, and the rest of it depends upon the individuality. For example, I investigated the conditions that prevail in New Zealand, in the factories. They have a

minimum rate fixed by law, but they have no maximum. In looking over the manufacturers' reports I found 50 per cent of the men earned only the minimum, that some earned 5 per cent above the minimum, and some 50 per cent above the minimum, according to their individual merits. That is, the spirit was to pay each man just what he was worth. Do you feel that is just—to pay each man just what he is worth, or would you pay him less than he is worth?

Mr. BERRES. That would take a whole lot of explanation.

Commissioner WEINSTOCK. No. You can answer that question yes or no. My question is, Would you pay a man all that he is worth?

Mr. BERRES. If I were an employer?

Commissioner WEINSTOCK. Yes.

Mr. BERRES. I certainly would.

Commissioner WEINSTOCK. And as a worker you would expect to get all that you are worth?

Mr. BERRES. Certainly.

Commissioner WEINSTOCK. If you are worth more than the minimum, you would expect to get more than the minimum, or you would feel that you were not justly treated. Is not that correct?

Mr. BERRES. That is right.

Commissioner WEINSTOCK. We have now established these points: First, that organized labor demands, and I think properly so, a minimum wage; second, that there is no maximum; and, third, you feel that if you are worth more than the minimum you should get more than the minimum, properly and justly. The question now arises, how is it to be determined how much more than the minimum you are worth. Let us see how we would come to that. Imagine you wanted to buy some coal, and I am a coal dealer. If you came to me and wanted a ton of coal you would not be satisfied if I used my eye in determining how much constituted a ton. You would expect me to weigh that ton out so that you would be sure to get your 2,000 pounds.

Mr. BERRES. I do not think I would stand for anything of that kind.

Commissioner WEINSTOCK. You would demand the exact rate?

Mr. BERRES. I think that is exaggerating the thing a little bit.

Commissioner WEINSTOCK. Not at all. That is easily answered. You would want your money's worth, and if the price of coal was \$10 a ton, and 2,000 pounds constituted a ton, you would not be satisfied if I used my eye and said, "I guess that is about a ton." You would insist upon my weighing it out and giving you all that you were paying for. Is that right or wrong?

Mr. BERRES. That is right.

Commissioner WEINSTOCK. Very well. If there is no maximum established, and there is a minimum, there is one of two ways in which I can determine how much more than the minimum you are worth. One is to guess at it, and one is for me or for the employer having a large plant to say to the foreman, "Whenever you think a man is worth more than the minimum, let me know, and I will pay him whatever more you think he is worth." Then another way is to do as you would want your coal weighed out to you, by exact and just methods, so that all of your efforts are properly and exactly measured, and not guesswork. Can you conceive any other way of determining that, than by either measuring, counting or weighing, or by guessing at it? And if so, let me know what other way there is—I mean by eliminating guesswork.

Mr. BERRES. I assume, first, that the man in charge of the shop of any character is a practical man.

Commissioner WEINSTOCK. Yes.

Mr. BERRES. And that he has had sufficient experience to prove himself a capable and efficient man. Otherwise he would not be acting in the capacity of foreman.

Commissioner WEINSTOCK. Yes.

Mr. BERRES. If that man is not qualified to know when a man is doing his best, when he is manufacturing the thing under the best possible conditions, then who else is going to determine it?

Commissioner WEINSTOCK. You then would give to the foreman divine powers and knowledge, which is impossible. I say this from practical experience, from absolute knowledge, I am a merchant. I employ a great many people in my business. I have heads of departments and some heads of departments have a good many assistants under their charge. I have tried the plan of going to the head of the department and saying to him, "Just rate all of your people here and tell me which produces the best results, who has the largest sales, and who has the smallest," and I have found that where he trusted to

memory, nine times out of ten he was wrong, and that the only way he could tell me accurately was to go to his reports and see the exact results, and rate his assistants accordingly. I do not think that a foreman of a shop is on the whole any higher in intelligence or accuracy than the average head of a department who earns all the way from \$1,800 to \$5,000 a year. Therefore, it would seem to me that in justice to the man there should be accuracy and not guesswork, and if men are to be paid in accordance with their deserts, if they are to receive all they are worth, as you think they ought to receive, is it not in the interest of the men then that it should be determined by accuracy, and not by the spirit of favoritism or by guesswork?

Mr. BERRES. I can only say briefly what I said in the beginning, that in my experience there is always a record kept, a card system, and when it comes down to the fine point where there has to be discrimination made, that enters into the final decision of the case. I do not think any man ever tries to run a pattern shop by guessing at it.

Commissioner WEINSTOCK. Then you do not object to accurate methods?

Mr. BERRES. Such as I have enumerated.

Commissioner WEINSTOCK. Would you take the least accurate methods in determining a man's worth, or would you take the most accurate methods?

Mr. BERRES. I would not care what kind was taken, so long as they did not interfere with my rights and place me in a position where I would simply become a machine.

Commissioner WEINSTOCK. When you enter a shop in the morning and register your time in the time clock, as they do, I take it, in most well-regulated shops, and register your time when you go out to your meal and when you come back again and at the close of the day, is that interfering with your rights?

Mr. BERRES. No.

Commissioner WEINSTOCK. You concede that that is proper and ought to prevail. When you do a piece of work and a card is handed to you and you place your card through the time clock, and when the job is completed it is passed through the time clock again to see how much time has been given to the job, so that its cost may be determined, is that interfering with your rights?

Mr. BERRES. No.

Commissioner WEINSTOCK. Very well. Then you do not object to the time clock in the transaction?

Mr. BERRES. In that way, no. I never worked under one of them, but I know something about how they are worked, and it always creates more or less trouble.

Commissioner WEINSTOCK. Timing a job creates trouble?

Mr. BERRES. Yes.

Commissioner WEINSTOCK. My dear sir, if I have an automobile shop and you bring your automobile to me, and my rate to you is \$1 an hour, how am I going to determine what to charge you unless I time my worker so that I can go to you and say, "That job took five hours," or five hours and a half or ten hours? Is it not imperative that the job shall be timed in order that the cost may be determined.

Mr. BERRES. I am not speaking that way. I understood you to say a man would register?

Commissioner WEINSTOCK. Surely he registers.

Mr. BERRES. He registers when he comes in and goes out.

Commissioner WEINSTOCK. Exactly. That is another occasion when he is timed.

Mr. BERRES. That is what I am speaking of.

Commissioner WEINSTOCK. He is timed when he comes in and goes out and he is timed in all well-regulated shops on the job that he does. I know that.

Mr. BERRES. I said I agreed to that. We make our cards in our shops.

Commissioner WEINSTOCK. You say that does not interfere with a man's rights—timing him when he goes in and when he comes out, when he starts and finishes a job. If that is the case, I still can not comprehend the distinction between timing a man when he comes in and goes out, and timing a man when he starts and finishes his job, and timing the man in advance, how long a job ought to take. Why do you not object to the two kinds of timing touched upon, and then object to the third time?

Mr. BERRES. Mr. Chairman, there is a great deal of difference between a man coming in the shop and ringing up a time clock, or doing something like that.

He is doing that alone. There is nobody there to watch him. There is quite a distinction between that and a man being given a blue print, and having somebody stand over him with his watch timing every movement that he makes. There is quite a distinction, and instead of creating in that man a desire to do his best, it brings his mind to such a state that it makes it absolutely impossible for him to do the best.

Commissioner WEINSTOCK. You mean that it fills him with resentment?

Mr. BERRES. Certainly.

Commissioner WEINSTOCK. I think you are quite right, Mr. Berres. If I were an employer and came to you, and made you feel that I distrusted you, that I thought you were soldiering on me, and made you believe that I was going to pursue a gum-shoe method, you would be filled with resentment, just as I would under like conditions, but if I came to you and said, "Here, Mr. Berres, we are not producing the best results, there is a way whereby you can make more money, and I can make more money. Let us get together and see if there is not some plan whereby we can reduce the cost of this work, and both of us profit by that reduced cost," would that create resentment in your mind?

Mr. BERRES. No; that would not.

Commissioner WEINSTOCK. From the explanations given—

Mr. BERRES. Will you let me say one thing in addition to that?

Commissioner WEINSTOCK. Certainly.

Mr. BERRES. Being an organization man, and heartily believing in it I should not want to act in that way simply in my individual capacity, in a suggestion of that nature that you might make. I should want the opportunity of presenting it to my organization, and if the employer saw fit to present a similar proposition to the organization, and they accepted it, it would be all right. I would not deal as an individual.

Commissioner WEINSTOCK. Are we to understand that when you join an organization you absolutely give up all of your rights and privileges and all of your prerogatives, and all of your individualities?

Mr. BERRES. How could an organization be successful if each fellow was going on and dealing with the boss, and one getting this and the other fellow getting that? What is the good of an organization?

Commissioner WEINSTOCK. You do that now. You tell me the organization has no objection to a minimum.

Mr. BERRES. But you are speaking of an employer coming to me with a proposition as an individual regarding a thing that affects the whole shop, which it naturally would. If there is going to be any improvement come to me, in justice to myself and my fellow men, I would want to let them know what the management had in mind.

Commissioner WEINSTOCK. Exactly. As an employer I go still further, and I would say, "I do not propose to do this thing for you and you alone. Whatever condition we shall establish shall be for the men in the shop; they shall have an equal opportunity with you. You are not going to get a monopoly, you are not going to get an exclusive privilege; it is going to be a common condition." But I take you as a representative worker, as a fair, intelligent worker, in whom I have confidence, so that we can get the basis, and the reason I use this watch on you is to get the basis, not to time you on every transaction, but to have some basis on which to figure. Could you object to that, reasonably?

Mr. BERRES. I can not see the necessity for taking every minute of time. Why should you put a man down to a minute? What is the occasion for getting a man down so fine? Is it not after all a desire, after once that is determined, to hold that man to that?

Commissioner WEINSTOCK. You might as well say, What is the use of taking a yardstick and getting it down to the accuracy of an inch or a quarter of an inch? It is to get accuracy. If you came into a dry goods shop and you wanted a certain yardage of cloth, you would not want me to measure it by my eye, but you would want me to measure it accurately.

What the yardstick is to a piece of cloth, the time watch is to determining the exact time it ought to take to produce a certain unit, in order that you may receive all that you are worth, and not less.

Mr. BERRES. I can not reconcile the proposition of measuring a yard of cloth with trying to measure a human being. I think there is quite a distinction between the two.

Commissioner WEINSTOCK. No; it is simply the point of accuracy, getting the accurate results, and eliminating guesswork.

Mr. BERRES. That does not necessarily follow that it is accurate. As I said before, a man may under those conditions do his worst. Any man who is taking a mental examination knows that while he may not be at his worst, yet he is not the man he ordinarily is, because he feels he is under extraordinary stress at that particular time.

Commissioner WEINSTOCK. Very true.

Mr. BERRES. So, after all, I dare say that the mere fact that a stop watch has been used is not an indication that the job has been done in the least possible time.

Commissioner WEINSTOCK. I think you are right there, but, as I take it from the explanations that have been made here, the basis is not determined by any one operation, but a great number of operations, which are timed in order to strike a fair average.

Mr. BERRES. That is true.

Commissioner WEINSTOCK. That overcomes your objection?

Mr. BERRES. No. I say the same thing could happen in each one of those operations.

Commissioner WEINSTOCK. It is possible, but hardly probable, in a great number of operations. There has been one point raised here upon which I would like to get your point of view, and that is that while all of these systems that we have heard so much about in the last few days, it is generally admitted—I have not heard it disputed—tend to reduce the cost of production, and that that reduced cost of production is divided between the employer and the worker; that is, that it means larger profits to the employer and increased earning power to the worker; yet it has been contended on the part of representatives of organized labor that that saving is taken out of the physical hide of the worker. Is that also your belief?

Mr. BERRES. That is a broad question. I do not think so altogether.

Commissioner WEINSTOCK. You think not?

Mr. BERRES. No. You were here, I think, when I enumerated some of the things that I thought could be done in a pattern shop in order to make the work more efficient. I would not say that was taken out of the hides of the workmen, because the machinery was placed right, and it was the very best machinery and the best material. I do not think anybody would take that position.

Commissioner WEINSTOCK. That position was taken at one of our previous examinations. I do not recall just who took that position, but I am quite sure—if I looked up my data I could locate it—that some of the representatives of labor admitted it meant more earnings to the men, but that the system was an injury to them physically; that they were overworked; that in place of working industriously they worked strenuously; and that it shortened their working life.

Mr. BERRES. Either you misunderstood them, Mr. Weinstock, or else they did not exactly state the thing in the manner in which they desired. I do not think anybody would take that position. I never heard of anybody taking that position where the machinery was placed in the most advantageous position.

Commissioner WEINSTOCK. No; I am speaking of systems and not especially of the placing of machinery.

Mr. BERRES. You asked if it was all taken out of the hide. I am trying to show what I think would be done and would not come out of the hide of the man—the increased productivity.

Commissioner WEINSTOCK. You mean bettered facilities?

Mr. BERRES. Yes.

Commissioner WEINSTOCK. Bettered shop facilities?

Mr. BERRES. Yes.

Commissioner WEINSTOCK. Admitting that part of it, Mr. Berres, would not come out of the hide of the men, would the other part of it, in your opinion, come out of the hide of the men? That is, their increased efficiency? For instance, if, under the old conditions, a man produced \$5 worth of work a day, and under the new conditions produced \$7 or \$8 worth of work a day, admitting that part of that gain was the result of improved facilities and that the other part of it was the result of increased efficiency on the part of the men, do you believe that, as explained here by the various witnesses, is at the physical cost of the operator?

Mr. BERRES. To some extent I do.

Commissioner WEINSTOCK. Is there any way that could be demonstrated to the satisfaction of this commission?

Mr. BERRES. In this way: If men are going to be timed down to the second and are expected to keep that up regardless of what the circumstances are,

would not you consider then that this increased productivity was being gotten out to some extent because of personal sacrifices on the part of these men?

Commissioner WEINSTOCK. That would depend upon the circumstances.

Mr. BERRES. But those circumstances are liable to arise?

Commissioner WEINSTOCK. From the explanations that have been made here by the witnesses, I should say not. I should say the methods as explained indicate that there is a great effort made to conserve—not to dissipate, but to conserve—the energy of the men, and without increased exertion and by greater skill and by better judgment, by a clearer understanding of his work, he will produce more without increased effort.

Mr. BERRES. I hope that is true.

Commissioner WEINSTOCK. If, on the other hand, these things do tend to injure men physically, it ought to be a fact; and if it is a fact, it ought to be demonstrable; and if it is demonstrable, we ought to know it.

Mr. BERRES. I should say this to the commission: The only way to find out accurately whether it is or not is to go into one of the plants where the thing is in operation and get the consensus of opinion of the people who are working directly under it, Mr. Weinstock. I have not worked under it, and there are many others, of course, who have not worked under it, so our opposition has come from protests, because of the fact we have well-defined principles in our organization with which this conflicts. But I believe the only way this commission can find out and determine for itself whether or not it is a bad system to expect men to work under, is for them to make a personal investigation of a plant in which the system is in operation.

Commissioner WEINSTOCK. I do not think that would produce the desired result, for this reason: We might walk through a plant, but it would be impossible for us, with hundreds of men there, to determine whether those men were physically better or worse off than they were before.

Mr. BERRES. You could get the men who do the work there and ask them.

Commissioner WEINSTOCK. You could get them all better than we could, because they could and would talk to you, and in a way they would not talk to us.

Mr. BERRES. You realize, in order to get the thing in the right shape, we ought to be able to see the men doing the thing. Don't you think so?

Commissioner WEINSTOCK. Yes.

Mr. BERRES. There are some people who protest, no doubt you have noticed, but when it comes to proving a thing, it is entirely a different matter. A man ought to be given the opportunity to show why such and such a thing is.

Commissioner WEINSTOCK. You were present, of course, during all these hearings the last two or three days?

Mr. BERRES. Most of them; yes, sir.

Commissioner WEINSTOCK. You will recall there were several employees on the witness stand, and that question was brought up particularly as to how it affected the health of the men, and they submitted figures that showed that the average health, if anything, was better than it had been under the old conditions.

Mr. BERRES. I should like just as well to hear that come from the other side, too, before I would render a decision. If you should ask for a decision, I should like to hear the other side of it. Figures are peculiar things, and it depends on which side you are looking from, sometimes.

Commissioner WEINSTOCK. I sit here as a juror, and you are the complainant—that is, organized labor is the complainant, and as the complainant, it comes to us and says "We object to that system because it injures our men physically." The other side denies that. The burden of proof, therefore, rests with you. You have to demonstrate that it does injure the men physically, and unless you can demonstrate that to the satisfaction of this commission, your charge falls to the ground.

Mr. BERRES. That is very true. The commission has the opportunity to ascertain whether that is the fact, whether the statement of the other side is the fact or not. The only conceivable way for the commission to get at the facts is to get the men, who are working directly under the system.

Commissioner WEINSTOCK. I do not know about that. I do not think we are expected to go out and become individual inspectors. When a charge is made, if you make the charge you are supposed to substantiate that charge with proofs. A court does not go out and make personal inspection. We are sitting here as jurors and court. The court does not go out and investigate into the nooks and corners. The parties are supposed to bring testimony and submit it to the court. The burden of proof rests with you, and not with us.

Mr. BERRES. The court would go and get eyewitnesses, and if they were going to bring in handwriting experts, or anything like that, they would have them promiscuously.

Commissioner WEINSTOCK. The parties to the issue would bring witnesses, and not the court. So you see, Mr. Berres, the burden rests with you to demonstrate to the reasonable satisfaction of this commission that that system does injure men physically. When you do that you have scored, and we must stand with you. If you fail to do that, your charge has nothing to stand on.

Mr. BERRES. I would say this: I think that when a number of men, such as the number I am going to mention, take the position they do, there must be something radically wrong, and I have every right to assume what they say is right. If you would take the Watertown Arsenal to-day, where there are 180 machinists, you will find the most affected trade by the installation of the so-called efficiency system, where there are over 150 out of 180 men who would, if they were given the opportunity to-morrow, repudiate the system; and that, I think, justifies the commission in making some investigation of those men themselves. That is the evidence we get.

Commissioner WEINSTOCK. In other words, you offer those men as your witnesses?

Mr. BERRES. Yes.

Commissioner WEINSTOCK. And you practically ask the commission to examine those witnesses?

Mr. BERRES. I say this: I say, out of 180 men there are 150 and over who, if given the opportunity, would repudiate the system. I take it from that there must be something very radically wrong about the system and that it does not give the benefit to the men that has been stated by those who are expounding the system.

Commissioner WEINSTOCK. Let me ask, Mr. Berres, if you think it would be fair to the men—that it would not in any way prejudice their positions or jeopardize their future careers—to bring them as witnesses before this commission? Do you think that would have any effect on them? Do you think they would be in a position to talk to us as frankly as they would do to you, this being a public hearing?

Mr. BERRES. I do not see why, Mr. Weinstock. I had the pleasure of bringing about a settlement of that strike when the system was first installed—a year or so after they started to install it—when a molder absolutely refused to work because of the stop watch, and when he refused he was discharged; and in consequence of that the other molders left the shop. I happened to be at the War Department at the time and I got those men reinstated, with the understanding that there would be an investigation within a reasonable length of time, and Col. Thompson was the investigating officer, and he told me that he wanted me to notify all those men, regardless of what their positions were, that if they came before him as the investigating officer he wanted them to feel that their positions would not be jeopardized, no matter what they said. He wanted to hear the truth and said they would be protected. I assume that this commission would tell the men the same thing.

Commissioner WEINSTOCK. I am not altogether sure that this commission is in a position to guarantee protection, because at best it is a temporary commission and will be out of existence within a year, and it would have no means of guaranteeing anything to anybody.

Mr. BERRES. I realize that, and I do not know that it would be necessary for the commission to take that position, for, after all, when any employer—even the Government as an employer—wants to get rid of a man they usually find means of getting rid of him without telling him just why; but I have no doubt there are a great many men employed in the Watertown Arsenal and other places who will be willing to come and tell the truth just as it is. I am glad to say we have got some men in Government institutions who have got backbone and are not afraid of their positions. If there is an evil existing, then a man ought to be man enough to come out and tell everything in connection with it, and I think you will find that there will be quite a number of men who will be glad to come here and lay bare the whole facts in the case.

Commissioner WEINSTOCK. Would you be in a position to give the commission the names of such men?

Mr. BERRES. I should make an attempt to get them. I think there is a gentleman down here from there now who would be glad to give such testimony. I do not know that he would. He is here, and I do not know why he should come if it is not for that purpose, if he is given the opportunity.

The ACTING CHAIRMAN. Mr. Lennon, have you any questions?

Commissioner LENNON. Mr. Berres, the attitude of trade-unions, because of conditions in modern industry, is emphatically in favor of collective bargaining, is it not?

Mr. BERRES. Yes.

Commissioner LENNON. Is it not a fact that, in so far as information has come to you, in the introduction of these efficiency systems they have undertaken to institute the personal contact and to eliminate the collective contact? Is not that the real cause, or the principal cause, of the opposition of organized labor to these systems?

Mr. BERRES. Yes; I should say so.

Commissioner LENNON. In your contact with men have you not found that the matter of habit is really second nature, as the old axiom states it; that is to say, that men form habits, either good or bad, and they become a part of the man?

Mr. BERRES. Yes.

Commissioner LENNON. Does not the opposition to bringing in a new system, without explanation, without consultation with men collectively, make a man fear that if he has learned a trade and has what he considers the necessary habits to make his exercise of that trade successful, in some way it is going to develop an injury to him?

Mr. BERRES. Yes.

Commissioner LENNON. Do you know of any case that has come to you through complaints or otherwise where, upon the attempt to introduce these efficiency systems, there has been a real effort made on the part of the expert introducing the system to convince the men collectively, not one man at a time, but collectively, of the advisability of this system?

Mr. BERRES. Not in any instance.

Commissioner LENNON. Suppose these systems were to recognize this idea of collective action on the part of the workers and take the men into consultation. What is your opinion as to the outcome? Would it be likely to be more favorable than now, or less favorable?

Mr. BERRES. I should say it would clarify the situation to a very great extent. May I say a word right here, Mr. Chairman?

A great deal has been said here by the experts with reference to what they believe of labor organizations and the necessity for them, and that labor was protesting against a system that they had not studied and knew nothing of, and particular stress was laid on the beneficial results that will accrue from the installation of such a system, benefits to the employee, and they would lead us to believe that in every instance they have kept before them the results of the installation of the system, as far as the men are concerned. But if that is true, it seems to me peculiar that they have not seen fit, inasmuch as this system is going to assist in bringing about the millennium—why they have never knocked at the doors of the conventions of these organizations of labor and asked the opportunity to explain these systems; because, in my judgment, from sitting here and listening attentively, it would seem that it would take some time to give proper instructions to men before they would have an understanding of the workings of the thing.

Now, if they are so solicitous of the welfare of the men, as they say they are, why have they not made some effort to go among those men in large bodies, where they congregate and where they legislate, and explain this thing to them and get their views on it? I have never heard of one instance where they have even gone into a locality, to a local organization whose members would be directly affected by the installation, to explain the system to them and ask what their views were.

So their efforts in the direction of educating the people up to the necessity of these things is not borne out by the facts; that is, they do not seem to be sincere in it.

Commissioner LENNON. Mr. Berres, is not the opposition of organized labor to a premium system, the payment of bonuses, or whatever you may call these systems, largely due to the experience that we have had with piecework?

Mr. BERRES. Yes.

Commissioner LENNON. That is to say, that while these are different modes, they do have some of the same element as to making prices that existed in the piecework system?

Mr. BERRES. I take it that they do; yes.

Commissioner LENNON. If the unions were taken into consideration, and it could be clearly demonstrated that these premium systems of payment and bonus systems of payment, or anything else under any other name, that the evils of the piecework system would not accrue, that justice would eventually come to the workers in so far as their earnings were concerned, do you believe the unions would continue their opposition to them under such circumstances?

Mr. BERRES. As I said before, I think that would go a long way. In fact, my idea is that most of the difficulty is because of the lack of understanding, the lack of cooperation; and I will say that that lack of cooperation and understanding is not due in any instance to the worker. The workers knock at the door of the manufacturer, the employer, and ask to be given an opportunity to discuss these matters, and they are not given that opportunity. If that opportunity was given, I will say that much of the difficulty could and would be eliminated.

Commissioner LENNON. I want to say here—I want to see whether your view is the same as mine—I take it that the opposition to timing a man with a stop watch rests upon the fact that he does not know why he is being timed in that way? It has not been explained to him. The whole scheme has not been laid out. If the whole scheme was laid out, he would see the necessity of it and the possible benefits to come from it, and he would not then take an antagonistic position against being timed by a stop watch simply because it was a stop watch. It is because he does not understand why it is to be done?

Mr. BERRES. I have expressed myself along that line, Mr. Lennon. As I said just now, if these gentlemen would go to the places where the representatives of labor congregate and ask for the opportunity to explain this—if they are solicitous of the welfare of labor and they think this is going to bring beneficial results to them, I can not see why they have not solicited the aid of labor unions, instead of waiting for the labor unions to come to them and ask about it.

Commissioner LENNON. That is all.

The ACTING CHAIRMAN. Mr. O'Connell, have you any questions?

Commissioner O'CONNELL. Have you ever heard of the hours of labor being reduced in any plants where these efficiency systems have been introduced?

Mr. BERRES. No, sir.

Commissioner O'CONNELL. The machine shop seems to be the common prey of these systems, as far as you know?

Mr. BERRES. Yes.

Commissioner O'CONNELL. You have already stated that you have never heard of any attempt at collective bargaining, or even to the extent of taking into conference the employees, before the system was being inaugurated or during its inauguration?

Mr. BERRES. No, sir; I never heard of it.

Commissioner O'CONNELL. That is all.

The ACTING CHAIRMAN. Mr. Ballard, have you any questions?

Commissioner BALLARD. Mr. Berres, you said that in many shops that were badly arranged the machines that the same man had to work on were in different parts of the room, and sometimes he would have to lose a great deal of time in going from one part of the room to another for these different machines. Suppose the efficiency engineer should come to the factory and say to the owner that his machines were badly placed, and in order to convince the owner of that fact he should say, "Now we will go down to this room where these machines are badly placed, and I will take the time of the man in going from one machine to another, to show you what loss of time there is by the misplacing of your machinery," would there be any objection to taking that time with a watch?

Mr. BERRES. I can not see that there would, not in that case. I think that would be so plain that there would not be any necessity for timing it.

Commissioner BALLARD. You would want to find the amount of time that was lost. Suppose, then, that the efficiency engineer should say to the manager, "It is important that you should have a board by the side of each machine, where the wrenches and other tools that the workman uses, and perhaps the cutting machines and all that, should be placed conveniently," and suppose the manager should say, "We have it very well systematized now," would there be any objection to the efficiency engineer saying, "To show you how much time is lost in finding tools, wrenches, and so on, I will take the time"? Would there be any objection to that?

Mr. BERRES. I can not say whether they would object or not. I can not speak for the other men.

Commissioner BALLARD. It seems to me it would be understood that he should take the time and see how much time was really lost in the bad arrangement of tools.

Mr. BERRES. If the tools were in the place that you say the shop would have them, I can not conceive of any other place they could put them that would be more convenient.

Commissioner BALLARD. I suppose every shop is arranged differently, and it would seem a part of scientific management, as I understand, that all the tools and all the work should come along in a consecutive way and be convenient and handy, so that there should be no time lost in finding them and getting them. I should think in order to convince the manager of one shop that it was necessary to have a rearrangement of his shop, the scientific engineer would be able to say to him, "You have lost so many minutes on this job in having a badly arranged shop."

Mr. BERRES. I might be able to cut out this inquiry by saying that we invite that kind of efficiency.

Commissioner BALLARD. He would take the time with a watch, of course, to see how much time was really lost.

Mr. BERRES. AS I say, we invite that kind of efficiency. We can not see any objection to it.

Commissioner BALLARD. Suppose the efficiency engineer should say to the workman, "You have turned around so many times in getting these tools," or "You have made so many false steps. We will see if we can not save you those steps, which have taken so many minutes, and rearrange the work, and rearrange the men's handling of materials as well as of tools and the machines." Could not that be done with a watch?

Mr. BERRES. I suppose it could be done. Whether or not the men would like it or would look kindly on it is another thing.

Commissioner BALLARD. Of course, in a shop where the work passes through the hands of a number of different persons, if they were working cooperatively it seems to me they would accomplish a great deal more. Perhaps the highest development of cooperative work is in a crew of boatmen, where there are eight men in a boat. They are timed absolutely, down to the last fraction of a second. Some crews take 27 strokes to the minute, other crews 31, others 42, and they will talk and argue as to which is the best, and every man is told how to sit, how to move his feet, how to handle his hands, in order to get the very highest possible efficiency and cooperative force. Everything is planned and timed to the very greatest nicety. Now, suppose the same system could obtain in a cooperative shop, where every man is a part of the unit, in all turning out the greatest amount of work and the best kind of work; would not that be fair?

Mr. BERRES. There is quite a distinction. Those men in the boat crew are only going to do that once, to-day. They are not going to do it day in and day out. They are not going to work under that strain all the time. Everybody knows that an athlete could not do the same thing day in and day out.

Commissioner BALLARD. That is very true; but in order to get the best results that has to be taken into consideration, and where they do it every day the time must be regulated to the best advantage, by a stop watch or some watch, or a time study is made in every case.

The ACTING CHAIRMAN. Have you any questions?

Commissioner HARRIMAN. No.

The ACTING CHAIRMAN. You have stated what seems to be evident from what I have heard before, that a good deal of the difficulty in this as in other cases is due to misunderstandings, mutual misunderstandings. Of course, the object of this commission is to try to clear up the misunderstandings. The commission has approached the subject from different angles, but we are trying in a semi-judicial way to arrive at some common meeting ground. If we could all agree on what is meant by scientific management, a good deal could be accomplished; isn't that so?

Mr. BERRES. That is very true.

The ACTING CHAIRMAN. I am going to hand you a very rough draft of a definition which I have prepared after hearing what has been said here, and I will ask you if you will study it over and at your convenience, if you feel like it, return it with any suggestions you may have on it.

Mr. BERRES. I should be very glad to do so.

The ACTING CHAIRMAN. Any other questions? We are much obliged to you, Mr. Berres.

Mr. BERRES. May I say just one word? I do not want to take up time, but I do not want to let the statement go without refuting it that in the case of men leaving their organizations where these systems are being installed two plants were cited, one the Midvale and the other the Bethlehem Co. I want to say that in either case there have never been enough union men in either of those plants to form an organization that would have a quorum. In the case of the Bethlehem Co. a man might just as well sign his death warrant as to let them know that he was a member of an organization, and I want to say that in the case of the last strike in 1910 it was investigated by the Labor Department, and reported in Document 521 of the Senate, an investigation under the direction of Charles P. Neill. And where the strike at the Bethlehem steel plant occurred there was no semblance of an organization, none whatever; nor has there ever been at Midvale. And while I do not think that the strike occurred because of the fact that the system was in vogue, I do want to say that if after that system was installed and those were the conditions that obtained there, surely, then, the system is not the great benefit to the workers that the experts say.

On page 18 of this document, the second to the last paragraph—this is for 1910—it says there were a large number of laborers working for 12½ cents an hour 12 hours a day, 7 days in the week; of the 9,184 employed in January, 3,640, or 28.7 per cent, were working for 12 cents and under 14 cents an hour; 1,528, or 16.6 per cent, for 14 and under 16 cents an hour; 48.5 per cent of all the employees were getting less than 16 cents an hour, 31.9 less than 14 cents, and 61.2 less than 18 cents an hour.

That is all I care to put in the record.

The ACTING CHAIRMAN. We are very much obliged to you, Mr. Berres.

Mr. BARTH. Could I be allowed just five minutes to throw light on the Bethlehem situation?

The ACTING CHAIRMAN. I do not think we can yet. If you will stay through the meeting, you will be allowed to make some rebuttal; but I think we had better not interfere with the other proceedings.

Mr. BARTH. I did not get quite finished yesterday. I could have said more.

The ACTING CHAIRMAN. Please make notes of anything. You may hear something that you will be interested in.

Mr. BARTH. I have got plenty of notes already.

TESTIMONY OF MR. SANFORD E. THOMPSON.

Mr. THOMPSON. Will you give your name and address, please?

Mr. S. E. THOMPSON. Sanford E. Thompson. I have offices at Newton Highlands, Mass., and also in Boston.

Mr. THOMPSON. What is your profession?

Mr. S. E. THOMPSON. Consulting engineer.

Mr. THOMPSON. What particular lines of work do you carry on as consulting engineer?

Mr. S. E. THOMPSON. My professional practice includes two branches—one of those consultation with reference to engineering design and construction and the other line management. The work of management is divided about equally between industrial work and construction work.

Mr. THOMPSON. With reference to your professional work in regard to management, how long have you been engaged in that?

Mr. S. E. THOMPSON. The strictly professional work, I have only been engaged in that for about three years. I was engaged for about 20 years, part of my time, in the work leading directly up to this, particularly in the study of the building trades.

Mr. THOMPSON. In regard to the study you have made professionally in the building trades, in regard to the question of management, have you served upon efficiency systems, so called, or scientific management?

Mr. S. E. THOMPSON. My studies have been along scientific-management lines; that is, the studies have been made according to the methods that Mr. Taylor has introduced in shop work.

Mr. THOMPSON. Has your study of scientific management, as you have said, had to do with the management of men?

Mr. S. E. THOMPSON. The special studies that I refer to have had more to do with establishing standards, time study, and economical operations of men; yes.

Mr. THOMPSON. Of men?

Mr. S. E. THOMPSON. Yes; in distinction from the machine.

Mr. THOMPSON. The subject we have under consideration here is efficiency systems and labor, and I want particularly to direct your attention to the question of scientific management and efficiency systems as they touch on the working of men. Where have you made studies of scientific management as relating to the workmen—in what places, what construction work?

Mr. S. E. THOMPSON. Either I or my assistants have made studies all over the country; that is, east of the Mississippi, east of Chicago—Boston and New York, Ohio, and various other places.

Mr. THOMPSON. You might describe briefly the result of such studies and the method in which you make them.

Mr. S. E. THOMPSON. You are taking up the latter part of the questions that you gave me first, are you not? I can illustrate that best by referring to some of the matter that I brought with me, not to present to the commission but simply to give an idea of the character of the work. This book which I have here on Concrete Costs, written by Mr. Frederick W. Taylor and myself, is the first publication of what might be called a code of laws for the concrete industry. It is a code 709 pages long. I believe one of these books has been sent here and is one of the exhibits before the commission. I am not going to read the book to you at this time, but I do want to call attention to the tables it contains. These tables show the time and cost of practically every operation on a concrete job. I have here part of the original note sheets and the computation sheets used in making up this little volume. These are the notes taken on form construction; that is, the making of forms for a concrete building.

If you turn to the book, you will find over here in the back part of the book the time and cost of labor on the forms. There are times and costs for, I believe it is, over 700 pieces or forms. By "forms" I mean the wooden molds that are erected when a reinforced concrete building is to be constructed, into which the concrete is poured. These give the times and costs for all kinds and sizes, something that is absolutely impossible to give by any other method except time study and the unit time method.

A table in the back gives the times of these various units used in making up these times given in the table. This matter here represents some of the tabulations necessary to figure up those times.

This other pile which is before me is the same height as a pile that I intended to bring with me, but could not get into my bag, which checks the amount of computation necessary in getting up this book. This code took about four years' time of two assistants all of the time and quite a good deal of my own time and some of Mr. Taylor's, and the cost of it was over \$20,000.

The apparatus we use in making time is a stop watch, and for convenience we inclose this watch in a book, which I have here.

The CHAIRMAN. I wish you would pass that around to the members of the commission.

Mr. S. E. THOMPSON. Very well; I will wind it up first. The manner of getting at these times in the course of construction is something as follows:

The work on this particular matter was done by one of my most competent engineers. He selected five of the best contractors in reinforced concrete in the country and made special studies on the job. He also took supplementary studies on various other jobs. In this way he found the actual time of performing each operation. It included the work from the time of lifting one board and driving one nail to the time of erecting and moving the forms.

In respect to the details he took the various methods adopted by the best contractors and studied them in detail, and combined the best in each, and also thought out new methods and obtained designs that were extremely economical to construct and use. I have a drawing here which shows that. I had several copies blue printed, just to show the result of one particular study. I do not expect you to appreciate the details of it, but it is simply a practical illustration of one practical thing that has been accomplished. This drawing is the result of these studies, and the form was designed by my associate, Mr. Lichtner, who made original studies. By such methods as these we found the time required to build forms for all kinds of work. We have in these form tables, for example, the times and costs for over 700 pieces or forms.

The importance of this form construction may be realized when we consider that about half the cost of a reinforced concrete building is in the making and

erecting and removal of the forms. If you would like to have me do it now, I can, perhaps, illustrate the method of making these studies, and the result.

Mr. THOMPSON. I would like particularly to direct your attention to the method of studying the operations of the men. For instance, you say that you studied the men with the five contractors and found how long it took from many studies for them to actually do the work, and that you also made suggestions as to more correct methods of doing their work.

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. I would like very much to have you give us more on that subject.

Mr. S. E. THOMPSON. Perhaps the simplest way to illustrate that is this—you mean the way that we actually made these time studies? Is that the idea?

Mr. THOMPSON. As I understand you, you have two methods of cheapening concrete construction?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. First, by finding the best forms to use. I take it that that had little to do with the actual work of the workmen. It may have reduced the amount of work necessary, but it had nothing to do with its management. It is the form decided upon as the best form to use?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. What I would like to get from you now is the studies you made and the methods of the workman when he drove a nail, when he lifted up a plank, and, briefly, what changes, if any, you made in that work.

Mr. S. E. THOMPSON. I think probably I can do that best if I follow out the line of two or three of these questions that you have handed to me.

Take the second part of question two: "Describe the methods used." The principles are the same in the shop where the requirements are similar to shopwork, just as in a shop where the problem is a large one and involves the scientific study of the methods and the men. I can illustrate best, perhaps, before giving you the methods, by showing you the results obtained in one concrete case, and that is the making up of the form for a concrete building. This making of the form is a carpenter's job. It is putting some boards together, and cleating these boards. I do not need to go into the details at all. By the ordinary method, and I am in this way taking up, I think, just the point you wish to illustrate, the foreman takes the general drawing of the building, looks it over, and tells each carpenter the size of the form required. The carpenter goes to the lumber pile, probably 50 or 100 feet away, seeks through the pile until he finds just the boards he thinks will fit, selects them and then carries them one by one to his workbench, and puts the boards together in almost any way he chooses. He measures and saws off the length and squares each end with a saw. Then, in order to make the width right, he runs a split saw the whole length of the board, which is very laborious work.

As a comparison between this former method which he used in a very large part of the concrete work, the larger proportion of it in this country, I wish to show now the newer way, the more scientific method. In this I am not describing a theory, but the actual practice followed on jobs that have introduced in them at least partial scientific management.

By this new method a detailed plan of the form, of the most economic design, is made up in the office. The boards are arranged so as to have just the right width to make the form, without any sawing, if possible. The boards for each form are sawed to length in a sawmill. They are then taken to the carpenters by laborers, and piled just back of their benches. The carpenter takes the boards and lays them out in the way called for by the plan. He uses the sizes of the boards exactly. He drives the number of nails shown on the plan. He gets better, stronger forms, in about a third of the time that he was accustomed to use.

I want you to note the distinction between the old and the new. In the first place, there is the design, and in the second place, there is the lumber which comes right, and in the third place there is the carrying of the lumber, which is done by laborers, who ought to do it, and in the fourth place there is the saving of the sawing by the carpenter, and in the fifth place there is the nailing of only the right number of nails and with the right tool, and in the sixth place, a point that I have not heretofore mentioned, the forms are made in groups, which will make them work most economically.

Instead of doing that work of the laborer, the carpenter does the work of his own trade. The danger of having to remake his work on account of

mistakes, something a skilled workman dislikes more than anything else to do, is almost entirely eliminated. If the regular day rate for a carpenter is \$4 per day, he receives, say, \$5.20.

Mr. THOMPSON. AS I understand it, so far as you have described the operation, it is principally preparing the work and telling the carpenter of the plan, so that he may save time. There is no specific time placed upon his motions or movements?

Mr. S. E. THOMPSON. That is one side of it. Now, on the other side, we have the timing. I have some notes here which are arranged in a certain order—

Mr. THOMPSON. If you have your notes in a certain order, we will take it up in that way.

Mr. S. E. THOMPSON. Perhaps that will be the quickest way. Suppose we drop for a minute, then, the making of the forms and take up the third question.

Mr. THOMPSON. Have you in any case dealt with labor unions in any such undertaking? If so, what attitude was encountered? Was that attitude uniform on the part of the different trades?

Mr. S. E. THOMPSON. I have never dealt with labor unions, although I have dealt with a good many labor union men.

Men who work under scientific-management methods always like the work, so far as I have found in all my experience, the union men and also the non-union men. I never saw a case otherwise. To illustrate that, for example, in a typical case, in a shop in Lawrence, Mass., that was being put under scientific management, we did as we usually do. We made studies, and after arranging the routings which I have described, we put a pair of two men onto task and bonus work, a couple of carpenters. After that had been going on for a couple of days—we always try them out before we put on any more men—a couple of men from the other side of the shop came to the foreman or superintendent and said, "Now, look here, we have been with you longer than these two men, and we can do just as good work as they can. Give us some of this extra money."

Now, that is not a special case; it is a typical case. In another case I have a letter that I happened to run across, which I received some time ago. It says, "All men, union and nonunion, are crying for task and bonus."

The trouble is always with some members of the company, or the superintendent, or both, just exactly the same as it is in shopwork. You can not convince the superintendent for a long while that this method is any better than his old method of swearing at the men and threatening to discharge them. You can not convince him that this old method is not better than the new method of paying extra pay and handling the men properly.

On the other hand, when the superintendents do realize the advantages of it from their own standpoint—I am speaking now of the ease with which the work is handled—and the better feeling with the men, then after a time they come to ask for it. One construction company, for example, is introducing scientific management in its various places. This company does work all over the country and has a large number of superintendents. It gives the superintendents the option of handling their work under scientific management methods or not, just as they choose. It has been about two years since this company began, and now the superintendents are coming to them asking to have scientific methods introduced into their organization. Now, in answer to your fourth question—

Mr. THOMPSON. I will read the question, so that it will appear in the record. I may say for the benefit of the commission that we handed Mr. Thompson some questions, written out, so that he would have a general knowledge of what we were going to cover.

Mr. S. E. THOMPSON. These questions cover almost exactly the original letter of the commission to me.

Mr. THOMPSON. What has been the effect of the system on the earnings of unskilled workmen?

Mr. S. E. THOMPSON. This varies with the class of work. In general, I might say from 25 to 35 per cent. In one case in the shop very recently we have been establishing a bonus of 100 per cent. That does not apply to construction work.

Commissioner O'CONNELL. Why does it not apply?

Mr. S. E. THOMPSON. This particular case was in a shop and not on construction work—this particular case of 100 per cent. I do not mean to say that

in certain forms of construction work you might not desire to use a 100 per cent bonus.

Mr. THOMPSON. Will you state the general increase in pay on construction work?

Mr. S. E. THOMPSON. As I have said, it is from about 25 to 35 per cent.

Mr. THOMPSON. Why is it that in shopwork there is the possibility of an increase of 100 per cent and on construction work only from 25 to 30 per cent?

Mr. S. E. THOMPSON. Your question does not state quite the truth of the matter. I did not say that it was impossible or inexpedient to use 100 per cent on construction work. In that case of a 100 per cent bonus I was simply referring to one particular, specific instance.

Mr. THOMPSON. You might state what that instance was, and why in that case 100 per cent increase was paid.

Mr. S. E. THOMPSON. This was in a shop, and the work was of a very intricate nature. Now, the union pay on that job was \$15 a week, but for that particular class of work on that machine it required a great deal of skill and experience, and it was no more than fair to give the men 100 per cent bonus, and so they were given a bonus by raising the pay to \$30 a week instead of \$15.

Mr. THOMPSON. What kind of work was that?

Mr. S. E. THOMPSON. I would rather not answer that question, because of some of the points that are involved. I would be glad to give the name to the commission, but not to have it spread on the record.

Mr. THOMPSON. You would rather give it to the members of the commission themselves?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. All right, then; you may do it at your leisure. What has been the effect of the system on the relations of employers and workmen, if you know?

Mr. S. E. THOMPSON. In every case that I have had anything to do with it has been beneficial, even leaving out of consideration the task and bonus feature. The men seem to like the work under the tickets, where the time of their work is recorded; and one of the reasons they give is that the favorites of the foremen are not given snap jobs; that it gives a square deal for everybody, and the work of all the men is recognized.

Mr. THOMPSON. What results have been secured in the form of greater speed and decreased cost of construction?

Mr. S. E. THOMPSON. Just one further word. I was not quite through with my answer with reference to the effect on the relations of employers and workmen. In the particular company to which I have referred, in construction work, the men follow the jobs around from one place to another. If the company has a job in Ohio, for instance, or we will say New York State, the men come—a good many of them at their own expense—in order to work on that job, instead of taking a job in their own city.

Mr. THOMPSON. Just one question there. To what extent is that due to the installation of the system.

Mr. S. E. THOMPSON. I understand that has been largely increased since they began to introduce these methods, and that is the reason given—that the men like the task and bonus—and so for that reason they follow the jobs around.

Mr. THOMPSON. Has that been told to you by the contractor?

Mr. S. E. THOMPSON. Yes. Also, we have been in contact with the work to a certain extent.

Mr. THOMPSON. What results have been secured in the form of greater speed and decreased cost of construction?

Mr. S. E. THOMPSON. With reference to speed, the management on construction work has not gone far enough to get very definite results. It stands to reason, though, that where the limit of speed on a job—that is, the period of construction—is limited, as it is in a great many cases by the number of men who can work on a job, if these men accomplish more there will be an increase in the speed; that is, the job will be completed sooner.

Furthermore, if we look at it from the standpoint of work that is accomplished, we might say, as a list of the things that would make for this:

1. The work is planned in advance.
2. The materials come in when they are wanted.
3. The materials come in the right quantity and shape to be used without sorting and rehandling.
4. Delays on account of unsystematic arrangement are avoided.
5. The skilled workmen accomplish more because they have material supplied more systematically.

6. The speed with which they do each piece of work is increased by the fact that they are given a bonus for its proper accomplishment.

Mr. THOMPSON. I should like to ask you at that point, Mr. Thompson, what proportion of the advantage comes from the bonus given to the men for increased speed, and what proportion of advantage comes from the other matters you speak of, like the laying out of the work, and so forth.

Mr. S. E. THOMPSON. That is a question that it is impossible to answer definitely, because the two are so intermingled. I should say at least half.

Mr. THOMPSON. At least half will come from the greater speed of the men resulting from the bonus?

Mr. S. E. THOMPSON. About half from one and about half from the other.

Mr. THOMPSON. How much importance do you attach to the time study?

Mr. S. E. THOMPSON. I consider it the foundation of the whole thing, that toward which the other work leads up.

Mr. THOMPSON. In actual practice, how is this study made? Have you covered that in your previous testimony?

Mr. S. E. THOMPSON. No; I have not. I can illustrate that best by taking a case right here in this room. If you will look toward the ceiling you will see a molding just above the paper. That is a piece of wooden molding. Now, I have here the times that are required for cutting and erecting a molding like that, and I do not think I can do any better, to illustrate the process of time study and also to show you how the time of the task is fixed, than to take that illustration.

It is evident, looking at that molding, that it will take a different length of time to place a molding like that, as it is so cut up by windows and with corners and a chimney piece and a long piece across that end, than if this room were perfectly square. There is no carpenter living, I might say, who can actually tell the difference between those two cases, but by time study you can tell the difference between those cases and all similar cases, if you have the right units.

Now, leaving out the very fine units, the unit times, as they are called, that we take with a stop watch are as follows:

Move tools and implements. That is, bring the tools to the job.

Get molding to hand. I am reading what was written off by a time-study man who came from the workman.

Get length of molding. Cut moldings off square.

Place in box and cut miter.

Place to nail.

Nail per foot, two eightpenny wire tin-finished nails, 16 inches on centers.

Nail extra per corner, cope molding, extra per slice, cut and miter, extra for mitered corner.

A combination of those units will give you the times on all kinds of molding.

Now, looking at it in a different way, and in order to set the task for it; that is, to find out how much it is, you have got to consider the difference between that beveled corner and the square corner, the difference between cutting it up against that window and laying a straight piece, and so we have these unit times divided into five groups. In the first place, there is the time of getting ready for the job; in the next place is the time of fitting the corner. Now, that time of fitting corner—just to illustrate that one point—requires an extra cut and an extra nailing, so that there are two or three unit items that come into that.

The third feature is the time per linear foot. That involves the placing and nailing.

The next is the fitting of the mitered corner, or the beveled corner, such as we have there. The next is splicing.

Now, from that I can figure the actual time that it takes. I came up here last night and simply paced the length and width of this room and counted up the corners, so as to save time; and in order to do that I took these times that were made up for a job of carpentering in actual use, for setting tasks of the men and figuring it. For example, there are 13 pieces, at a minute and thirty-five hundredths; that is, 17 minutes and a half. There are four corners at 1.57; there are four mitered corners at 2.76; there are 68, approximately, linear feet of molding, at one-quarter of a minute apiece, seventeen minutes and seven-tenths.

There is one splice, right up here, 2.90. Add to that the time of moving tools and getting ready, and we have for that, 4.45. The total time would be

fifty-nine minutes and eighty-seven hundredths. In practice, that would be 1 hour, or 60 minutes, for cutting and placing that molding.

Mr. THOMPSON. That is in this small room?

Mr. S. E. THOMPSON. If this room were square, I have figured it out that it would be about 40 minutes.

Mr. THOMPSON. That is this room here?

Mr. S. E. THOMPSON. Yes.

Commissioner WEINSTOCK. That is, it would take an hour to put the molding around this entire room?

Mr. S. E. THOMPSON. No; only this section, this end.

Commissioner WEINSTOCK. Three sides?

Mr. S. E. THOMPSON. Practically it would be five sides, because of the angles there.

Commissioner O'CONNELL. Now you are all getting anxious.

Mr. THOMPSON. What time percentage would you allow the workman to accomplish that in order to get a bonus? Would it have to be done in an hour?

Mr. S. E. THOMPSON. No; you would add to that 30 per cent. That 30 per cent would cover the necessary rest and delay.

Mr. THOMPSON. How do you figure this 30 per cent? On what basis is that arrived at?

Mr. S. E. THOMPSON. That percentage is based on certain definite rules, depending on the heaviness of the work and on the rapidity with which it has to be done, and in the trade those percentages have to be established; they vary with the different character of the work.

Mr. THOMPSON. Can those rules be gotten at? Are they published?

Mr. S. E. THOMPSON. No; they are not.

Mr. THOMPSON. Can you tell us what those rules would be with reference to the placing of that molding?

Mr. S. E. THOMPSON. The rules are in a measure empirical. They are partly based on experiments such as Mr. Taylor described in his talk with reference to the weight on a man's arm, and in other cases they are based on time studies of the operation of a particular job. For example, in a new job, of course, we have no percentage and you have to fix the task; and you can determine from these other percentages on other classes of work very nearly what the percentage would be; but in order to be sure of what you are doing, and check that, the plan that we follow is that after finding the accurate times and combining them, to time a man on a piece of work involving all these units—for instance, in this particular case we would time a couple of men putting around that molding on a number of rooms, and we would time him so as to be sure that he was not loafing; simply we would watch him and take times on him and see that he wasn't loafing, and then from that you would get at the proper percentage.

Mr. THOMPSON. What definitive time do you allow in that increased time for delay in getting materials, or delay in getting tools, or anything of that kind?

Mr. S. E. THOMPSON. That is this 4.45 minutes that I spoke of. He brings the tools with him to the job, and the material is put around by laborers; routed to the job, as we call it.

Mr. THOMPSON. Those estimates are based on the assumption that he has the material and the tools at hand?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. And in the extra time of 30 per cent, that is also calculated on the basis of the tools and material being at hand?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. Then, in the estimate so far there is no allowance such as named yesterday in the American Locomotive Works, where the witness said he saw men frantic waiting for the crane to come along?

Mr. S. E. THOMPSON. No; if you have waits of that kind you have not scientific management at that point in the game.

Mr. THOMPSON. In other words, in making an estimate for time on task work, then, where the worker had to rely upon the presence of a machine like a crane, that he could not control, but was used by others, the system would break down?

Mr. S. E. THOMPSON. No. If there was simply one crane in the place and that had to be used by these workers, the work would be routed to that crane so as to distribute it as evenly as possible, so that you would have a

minimum of waits; and then if the study showed that there were waits which can not be taken into account, then there would be enough time allowed to these men to make up for these waits on the average.

Mr. THOMPSON. That could only be arrived at by a study of a long period of time, could it?

Mr. S. E. THOMPSON. Yes. That is just what I mean by the scientific method. You have got to get these things ready before you can put scientific tasks into operation.

Mr. THOMPSON. What grade of man is selected as the subject of study?

Mr. S. E. THOMPSON. A man well fitted for his work.

Mr. THOMPSON. What incentive is given him to work efficiently?

Mr. S. E. THOMPSON. That varies. About 50 per cent is usually a fair amount to give him. You would take it up with him and tell him you are going to put him to some trouble and are going to ask him to work in just the way you want him to—that you are going to ask him to take the tools you are going to ask him to use, and are going to ask him to do the work in the sequence you request; and for that you give him this extra amount. He does it with the knowledge it is to be for task work.

Mr. THOMPSON. How many observations are ordinarily made, if you can state that?

Mr. S. E. THOMPSON. That varies entirely with the character of the work. If a particular unit time occurs only seldom, comparatively few times are taken. If it is something that is to be repeated for a large number of times, like shoveling, perhaps a thousand or more times are taken. Then I would say the range would be from a very few up to a thousand, according to the class of work.

Mr. THOMPSON. The purpose of the installation of your system, Mr. Thompson, or of any such systems, is to eliminate waste, is it not?

Mr. S. E. THOMPSON. Yes; that is one of the purposes.

Mr. THOMPSON. And when that touches the actual work of the workmen, it is to eliminate waste of time in the performing of the job?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. Therefore, it starts with the basis that the workman will complete a given job in less time than before?

Mr. S. E. THOMPSON. No; not necessarily. He will complete it in a time which is fair. It might be you will reduce the time or increase the time he is taking for the work; you would increase the time he is taking if he is working too hard.

Mr. THOMPSON. If it is piecework and he is crowding himself too fast, the time will be increased?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. And he will be compelled to work slower?

Mr. S. E. THOMPSON. Yes. I had my attention called to an illustration of that. Two or three years ago a certain construction work was doing a little with scientific management methods, and there was one foreman who was called a man killer. He was handling steel bars for concrete work, and working his men by the day. They were worked extremely hard. There was something said about putting that work on the task and bonus, and we refused to have anything to do with that so long as that foreman held his opinions. I understood only a few days ago that that foreman was still with his company, and he has seen the introduction of the task and bonus and the operation of it on other classes of work, and so he came around and asked for it, and had taken it in the spirit in which it was introduced, and was going to work under the task and bonus.

Mr. THOMPSON. Then, in so far as his work was concerned, you might have reduced the output of a given number of men?

Mr. S. E. THOMPSON. Yes; we probably should.

Mr. THOMPSON. That would be, in your opinion, to the advantage of the men?

Mr. S. E. THOMPSON. Yes. I would qualify that other answer now, because in that particular case, and in general, the ultimate effect would not be to reduce the output. We would reduce the amount of work that he would do, the amount of labor, but we would make up that difference by these other principles of properly routing material and methods of handling.

Mr. THOMPSON. I am always eliminating that element in my questions. As I stated in the beginning, I am trying to get at the matters that affect purely the workman in the performance of his work. I am taking it that you could,

by routing and superior planning, make a saving in the work even though you made no time studies of the men?

Mr. S. E. THOMPSON. Yes; although the time studies are necessary to a certain extent in order to properly route the work, because you have to tell how long a job takes in a general way, and sometimes quite definitely, in order to fit it in with other jobs and lay it out in advance.

Mr. THOMPSON. That would not necessarily be a time study of each operation, but a time study of the average of time the job took under the old method?

Mr. S. E. THOMPSON. In a good many cases the time study of the individual operation is absolutely necessary.

Mr. THOMPSON. That is, not for the purpose of laying down a rule of action for him, but rather to serve the purpose of the other planning and routing?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. But generally the idea is that by the introduction of these systems waste will be eliminated; first, with regard to the planning, routing, etc.?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. And next, and the question in which we are interested, in saving the time of performing a task by the worker.

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. And that amounts to about 50 per cent of the proposition, as you have stated?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. In setting the time for a task, do you generally allow a bonus in connection with the performance of that task?

Mr. S. E. THOMPSON. I do not quite understand your question, whether you mean bonus in distinction from other—

Mr. THOMPSON (interrupting). I mean a bonus as used by Mr. Taylor.

Mr. S. E. THOMPSON. We allow some method of giving the man more pay.

Mr. THOMPSON. Will you state one method of that? And I would then like to examine you on it. Take this carpenter job of which you spoke. I suppose that would be repeated a thousand times?

Mr. S. E. THOMPSON. We usually adopt, as a method of paying the extra money, what we call the bonus system. But may I bring out a point right here that seems to have been treated with more or less confusion? That is the form of payment, whether it be bonus or premium or any other, is of but little fundamental importance in comparison with the scientific determination of the task. One plant that was referred to, the Link Belt Co., has a form of piece-rate system. The Tabor Manufacturing Co. has a bonus system. Mr. Gantt has a different form of bonus from what was used in that plant. The Plympton Press, referred to yesterday, has a combination of bonus with graduated wage system, and so on. But all of these produce the same result simply because they have the same fundamental basis of the scientific determination of the time and, naturally, the distinction between what sometimes has been called in this hearing piece-rate work and the newer method.

Mr. THOMPSON. Give us one statement of a bonus scheme with reference to the performance of the work within a task time.

Mr. S. E. THOMPSON. In this case to which I have referred the time we have figured is 1 hour and 18 minutes. If he gets it done in 1 hour and 18 minutes he receives the pay for that time and also a bonus of 30 per cent on that pay. If he does it in less than that time, he receives simply his day pay.

Mr. THOMPSON. If he performs it in less time?

Mr. S. E. THOMPSON. I beg your pardon. If he performs it in more time, if he takes longer than 1 hour and 18 minutes, he gets simply his day's pay for the time he is working on it.

Mr. THOMPSON. Is there any graduated bonus system that you use in which the saving of time from minute to minute becomes of added benefit to the worker in increased pay?

Mr. S. E. THOMPSON. No; not just in that way. But after he reaches that point, if he does it in a shorter time, then he gets some increased pay. Below that time he gets no more than his day wage.

Mr. THOMPSON. You mean above that time?

Mr. S. E. THOMPSON. Above that time; I beg your pardon.

Mr. THOMPSON. If he takes longer, you mean?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. What would be the increase of work of that kind that would be often repeated if he completed that work in 10 per cent less time or 20 per cent less time?

Mr. S. E. THOMPSON. You are going into details that I question very much really affect the conditions. There are different ways of handling that kind of thing. To go into details, it seems to me, will rather confuse the point and take quite a good deal of time in explaining the different methods. For instance, I see Mr. Gantt uses one method of bonus. The Tabor Manufacturing Co. uses another method. The exact way of handling that differs. If you want me to do so, I will be very glad to do it, but it will take a good deal of time to go into the detail, where we have the general principle—

Mr. THOMPSON (interrupting). Let me put a question which may bring out an answer to the whole proposition. If a scheme of bonus is provided by which the worker receives increased pay for each minutes that he saves in performing the task, then that bonus and that scheme would have the effect of offering a premium to the worker to work as fast as he could, would it not?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. And the tendency; and it must be the purpose of offering such bonus is to get the worker to perform the task as fast as he can?

Mr. S. E. THOMPSON. If you adopt that method; yes.

Mr. THOMPSON. Consequently it would be, so far as desired, no different from ordinary piecework as to getting the workers to work as fast as they can?

Mr. S. E. THOMPSON. If you have no limit and no distinction, that might be true. The bonus method that I have referred to does not have that difficulty, because we fix the task which is supposed to be a fair task. We do not care for him to do it in much quicker time than that. We consider that a task is about right for him, and if he does it in quicker time we do not give him so much greater excess than we give him for doing it in the required time.

Mr. THOMPSON. Then it is your opinion that to place a bonus upon the quicker performance of the task is not the right theory to have the task performed?

Mr. S. E. THOMPSON. I rather prefer this other method.

Mr. THOMPSON. But you do agree that where such a theory is put into operation of offering the workman the premium on all the time he saves that such has a tendency and is intended to get him to perform the task as speedily as possible?

Mr. S. E. THOMPSON. I would not say as speedily as possible. I would say as speedily as he can do it without overwork. If a man is getting good pay, he is not nearly so apt to overexert himself as if the limit was away down low. If you give him a good advance over his ordinary day's work, there is not the incentive to overwork himself, as you might say.

Mr. THOMPSON. The very theory, however, of offering him a bonus for doing it in shorter time must be of appealing to him and creating an incentive for him to work faster. That must be the theory of it, must it not?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. Whether it actually works is another thing, of course. As I understand, according to your statement, if he gets a fair day's wage, he is not inclined to accept this incentive, and it is intended for that purpose?

Mr. S. E. THOMPSON. The whole proposition is that under whatever system you have you fix what is a fair day's work, and give the men to understand that that is what he is rather expected to do.

Mr. THOMPSON. In the setting of these task times in any place where you have set them have you ever taken into consideration or worked with the workmen in the determination of a standard time?

Mr. S. E. THOMPSON. Yes; in every case.

Mr. THOMPSON. In any of these cases has he had, with the employer, an equal voice in making that determination?

Mr. S. E. THOMPSON. He practically has the deciding voice, for this reason: After we make our studies we set a man onto his task and offer him the bonus for its accomplishment. He knows what he is doing it for; he knows he is doing it to establish a rate for that whole shop. He is not pushed; he is not asked to exert himself. He is told how to do it; he is told the right way to do it; and until and unless he shows he can do it no result is reached. But if we feel that there is something a little bit wrong with the task, and unless at the first send-off a man can do what he is told, that task does not go. When a task is set and is in operation—for example, in a case that I have in mind, there were some carpenters who were setting a window casing. A time was

set on a new job, based on unit times, and the carpenters immediately fell down on it. This was during the introduction of the system. They immediately came to the foreman—it does not take them long to find that out—and the time-study man went out there and found there was a mistake in setting the task. It was immediately corrected.

Mr. THOMPSON. Who determined that there was a mistake in setting the task?

Mr. S. E. THOMPSON. The time-study man.

Mr. THOMPSON. And his determination was the final decision?

Mr. S. E. THOMPSON. In that case I believe my associate was on the work at the time, and he made the final decision. If he had not been there, the time-study man's decision would have been accepted as final.

Mr. THOMPSON. The time-study man was an employee, either directly or indirectly, of the employer?

Mr. S. E. THOMPSON. You mean by that that he was paid by him?

Mr. THOMPSON. His time was paid for by the employer?

Mr. S. E. THOMPSON. Certainly.

Mr. THOMPSON. In your opinion, would it not be feasible for the employee to have an equal opportunity to have a voice in the determination of the time study, as you say he already has, and also would it not be feasible for him to have an equal voice in the selection of the time-study man?

Mr. S. E. THOMPSON. I would like it very much to have a workman pick out satisfactory time-study men for me. One of the most difficult things in introducing a system of management is to find the proper time-study men to handle these different classes of work. Now, if the men would pick me out a time-study man that would do his job accurately in this routine, scientific fashion, I would be delighted to have them do it.

Mr. THOMPSON. Then, you see no objection?

Mr. S. E. THOMPSON. I would not have two men on the job. That would be impracticable entirely.

Mr. THOMPSON. In other words, you think that the use of the extra time study man representing the employers would not work?

Mr. S. E. THOMPSON. It is absolutely impracticable.

Mr. THOMPSON. They do use it, though, in the anthracite coal regions. They have there what they call a check weighman.

Mr. S. E. THOMPSON. That is an entirely different proposition. Yes, and I understand that they have a lot of friction; it would engender the friction and reduce the good relation that does exist. I never find any trouble in timing men. We have never run up against this trouble of timing men, and no objection whatever to their being timed, by the men or girls either.

Mr. THOMPSON. There is another objection that you may not be aware of, in the organized labor world against these systems; not against efficiency, as I understand their position, but as against these so-called efficiency systems of which Mr. Taylor's is the leading one which they mention. It seems to me that the opposition could be removed to a great extent, perhaps wholly removed, if there were some introduction of the democratic principle into it. Of course, the place where it would be of greatest importance would be the setting of the time standard.

Mr. S. E. THOMPSON. I can not answer that, because I disagree with your original statement that there is objection to it on the part of the laboring world. The men with whom I have had to do, whether they are union men or nonunion men, so far as my experience goes, who have actually been in the shops and on the jobs where the methods are being introduced, like it without exception.

Mr. THOMPSON. Let me put it to you in another form. Assuming that the time standard has been set for the work, what is to prevent the employer from introducing that time standard at any time he pleases, if he is the sole judge?

Mr. S. E. THOMPSON. For the same reason that an employer who is paying laborers on the street \$1.75 a day does not reduce them to \$1.25 a day. That is one of the reasons.

Mr. THOMPSON. In other words, you mean the supply and demand of labor would control it?

Mr. S. E. THOMPSON. Yes, if the workmen object. Another very fundamental difference, which is very difficult to appreciate—this is not theoretical; it is practical, but it is very difficult to appreciate, and that is the change of attitude that comes about in the management after a system of real scientific management is introduced, and they have an entirely different feeling toward the men, an entirely different feeling toward the amount that the men earn. Of

course, I am talking strictly about where the work is really done under scientific methods.

Mr. THOMPSON. But in the last analysis the controlling factor is that the employer can not reduce the price below the point where he can get the men?

Mr. S. E. THOMPSON. Or have friction in his shop, or misunderstanding in his shop. It is opposed to the whole principle. One of the fundamental principles is that you must not cut rates. If you cut rates you throw the whole thing away.

Mr. THOMPSON. Assuming that the proprietor is willing to stand that friction, and assuming that he minimizes the possibility of it when times are dull and the demand is not so great, and the men are not only willing to work under the cut, but they have to work under a cut, and they work pleasantly; that is, they will have to like it.

Mr. S. E. THOMPSON. He may not reduce the bonus; he may reduce the day wages. If the cutting of the rate of wages was reduced considerably below what was being paid in other shops in the locality—but he would not do it until he had gotten down to a certain extent below, because a good manager—I don't care who he is—likes to pay the high rate of wages rather than the low rates, and when the hard times come and the going rate of wages in that industry are reduced—then he would consider reducing the rate of wages of employees, the day pay.

Mr. THOMPSON. But that variation in the day rate and the variation in the treatment of the men, in accordance with the shops in that locality, would apply as well without the system as with it, would it not?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. And consequently the employer, without having the system, would naturally pay the rate of wages in the community, would he not?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. If he wanted to work without friction?

Mr. S. E. THOMPSON. Yes.

Mr. THOMPSON. Then under your idea there would be no need, or if there is no need for the organization of the men under this system, there would be no need for organizing the men without the system.

Mr. S. E. THOMPSON. I did not say there was no need of organization.

Mr. THOMPSON. Does not that follow from what you say?

Mr. S. E. THOMPSON. I do not say there is no need of organization.

Mr. THOMPSON. Do you believe that the organization of workmen in a shop where there is scientific management would result to their advantage? Could there be any point where they could meet with their employer and set day rate standards or the like?

Mr. S. E. THOMPSON. Yes; there is no reason under the sun why they could not meet and set this base rate wage.

Mr. THOMPSON. They could meet and organize for the same purposes and to the same extent in the scientific-management shop as well as in one in which there was no such scientific management?

Mr. S. E. THOMPSON. I do not think the necessity for it is quite so great, because of the better feeling between the men and the management, but there might still be a necessity for it.

Mr. THOMPSON. You see no objection to it?

Mr. S. E. THOMPSON. No.

Mr. THOMPSON. Mr. Chairman, that is all I care to ask the witness.

Commissioner O'CONNELL. Your personal application has largely been in building trades' lines, as I understand it?

Mr. S. E. THOMPSON. It has been about equally divided between that and the shop.

Commissioner O'CONNELL. What large manufacturing plants have you had experience with, employing 500 or 1,000 workmen?

Mr. S. E. THOMPSON. In the shop a good deal of my work, or at least a certain part of my work, has been one function. We have done something with the entire shop. One of the shops I have been connected with—I will speak of it because it was mentioned yesterday—was the Plympton Press. We make the original time studies there and set the first tasks.

Commissioner O'CONNELL. That was a machine shop?

Mr. S. E. THOMPSON. No; a book-printing establishment.

Commissioner O'CONNELL. Oh, the press—a printing office?

Mr. S. E. THOMPSON. Yes.

Commissioner O'CONNELL. Have the hours of labor been reduced in any way in that plant since the system has been in operation?

Mr. S. E. THOMPSON. I think they have. I am not positive about that; but I think that is on the records; I think the statement was made by Mr. Valentine. I will say that I went through the shop the other day, and we came into the room where the monotypes are at work, where the girls run the typesetting machines, and there was nobody around the machines; the windows were open, but none of the girls were there. Two or three minutes afterwards the girls all came trooping back. They had left simply for a recess.

Commissioner O'CONNELL. Do you know anything of the earning of the girls in that plant per day or per week?

Mr. S. E. THOMPSON. I would rather not give it from memory. I know they make good pay.

Commissioner O'CONNELL. What is to prevent the employer from establishing a rate of wage or a basis with an employee, say of \$3 per day, and, then, on top of that, establishing a bonus; setting a standard and then giving a bonus for going above the standard? What is to prevent him, in the course of time, from employing a man at \$2 a day to perform the same work, when the total earnings of the latter man and his bonus would not equal the former day rate of the first man?

Mr. S. E. THOMPSON. That is something I have never had any experience in. In all the work I have had to do with, the men who were running the machines and handling the work, were getting pay that was suited to their jobs, and I do not know of any change of that kind.

Commissioner O'CONNELL. Well, the rate is not based upon the job particularly, is it—upon the man, or which?

Mr. S. E. THOMPSON. The pay for all kinds of work is governed more or less by the character of the work.

Commissioner O'CONNELL. If you say that a certain job shall be \$3 a day, and the bonus on it was \$1 a day, that job will pay \$4 a day, we will say.

Mr. S. E. THOMPSON. Yes.

Commissioner O'CONNELL. Is every man that comes along entitled to that, regardless of his capability? Is that the standard—that every man that got that job would get?

Mr. S. E. THOMPSON. As an illustration of that point, the way it is handled in a certain plant might be of interest. That has to do with a process that requires a good deal of experience and skill, and this method of pay came in when I had to do with the work in that shop. I think it was at my suggestion, the way it was handled in that particular case; those girls are classified into three different grades. There is one rate of pay, we will say, at 12 cents an hour; another set of girls, on the same operation, earn 14 cents an hour; another set of girls, on the same operation, earn 16 cents an hour. That is determined automatically by their output. Just as soon as the 12-cent girl gets up to a certain standard of output, after she gains experience—she becomes a 14-cent girl and also gets a bonus on that 14-cent rate.

Commissioner O'CONNELL. That is, each one has a particular task that must be worked up to?

Mr. S. E. THOMPSON. Yes.

Commissioner O'CONNELL. In order to get the increased rate you must work yourself up to perform a certain task?

Mr. S. E. THOMPSON. Yes.

Commissioner O'CONNELL. Then that becomes purely a task system; that is not based on any special wage system. It is simply a task that is established, and if you want to get into this 12 or 14 or 16 cent class you must be capable of performing the task required, to get into that class?

Mr. S. E. THOMPSON. Yes; and that task is established by special stop-watch studies and time studies.

Commissioner O'CONNELL. If you were working in a department store where they employed clerks selling the ordinary materials that they handle in that store, how would you go about it to take stop-watch records of the ability of a clerk to sell goods to a purchaser?

Mr. S. E. THOMPSON. Well, in the first place I would want to spend perhaps six months in that shop and study it out and find the best way to do it. I certainly would not be willing to write a report to the company and tell them how that could be done without making a thorough scientific study of the whole thing.

Commissioner O'CONNELL. You think there is a great divergency in the ability or capability in one clerk to deceive a certain patron into the merits of one certain kind, or class of goods or another; how would you do that with a stop watch?

Mr. S. E. THOMPSON. As I say, this proposition is one that I have never run up against, but I would find some way to do it.

Commissioner O'CONNELL. In other words, the capability of this girl to lay off 3 feet to the yard, laying off calico, she might lay off a little bit extra?

Mr. S. E. THOMPSON. Scientific management does not depend upon time study. I tried to make that clear.

Commissioner O'CONNELL. In the case of the stop watch, your rule would say that 3 feet made a yard of calico?

Mr. S. E. THOMPSON. Yes.

Commissioner O'CONNELL. But how would your stop watch get at the capability of that girl to convince a lady purchaser that that was the calico she wanted in less time, or in a speedier time, than another clerk would sell you that, or another man would sell you a pair of shoes or a suit of clothes, and convince you that it was all wool when it was cotton? How would you get at a proposition of that kind?

Mr. S. E. THOMPSON. As I say, we take all kinds of propositions of that kind and study them out. It might not be a stop-watch proposition at all. There are other elements.

Commissioner O'CONNELL. Then there is some other method besides the stop-watch method by which you can get studies?

Mr. S. E. THOMPSON. If you ask whether a woman is honest or not—if you want to determine whether a woman is honest or not, you can not do that by a stop watch; so that I will say you can not determine everything by the stop watch, unquestionably.

Commissioner O'CONNELL. Then everything is not based upon the time of measurement or figures, the whole proposition of production?

Mr. S. E. THOMPSON. I have given a specific instance where it is not. You can not determine, so far as I can see, whether or not a girl is honest to her customers by any stop-watch method.

Commissioner O'CONNELL. But, so far as your experience goes, has not the question of efficiency been largely applied to certain lines of industry; for instance, machine shops?

Mr. S. E. THOMPSON. I never had anything to do with machine shops, and I don't know anything about that.

Commissioner O'CONNELL. It seems to be a common prey for experts and experimentalists and cranks and all that sort of thing; they light on the machine shop the first thing. I don't know why.

Commissioner GARRETSON. The machine shop is the dog in this, like the railways are the dog in national legislation.

Commissioner BALLARD. The only question I have is that it has been suggested that a man whose time has been set out under the bonus system, if a crane was not in operation and he could not get to it in his work he would be delayed. Would that system at all contemplate giving the man credit for anything of that kind, if he was delayed a certain number of minutes? Would he have a right to go to the foreman and say, "Here, I have made no bonus this day, because at such and such a time the crane was in use and I did not get the benefit of it"?

Mr. S. E. THOMPSON. I have a memorandum on that point, and I am glad you spoke of it. If a delay of that kind is long, he has the privilege of having day work during that period; that is, his task stops just with the delay, and would be taken up when the delay is gotten out of the way. If it is something that comes constantly, it is allowed for in some way, so that it will not affect his pay. A man can not be docked—well, I didn't mean to use that word, because it is not that at all—a man can not lose his bonus or his premium properly for causes that are not his own.

Commissioner BALLARD. It would be like the clock on a taxicab—it will register when the machine is not going?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. Mr. Thompson, you recognize our difficulty in getting a definition of scientific management. It would seem we need some definition. I would like to try this on you: As I understand, you have adopted the word "scientific" in order that you may possibly include all systems that you choose to pass upon as coming within a certain standard. Is it merely to

make the public feel that you have some superiority? We are coming to a time when we call one kind of religion "Christian Science," but it does not make that religion effectually different from Mormonism or Theosophy. The question is, can we get some other word besides "scientific" that will not carry with it an implication that it is something superior, that ordinary people can not understand it, but that it requires experts to understand it? Can we define "scientific management" according to something that we actually mean? As I take it, gathered from all that has been said, it does not apply to any method or any doctrine, but it does mean that whatever you do you establish some way or method of accurate measurement. Is there any principle in scientific management that we can reduce it to so it means what you actually intend by it? Is it to substitute in all things some method of accurate measurement as against rule of thumb or tradition, or must we have something else besides that? I take it from the fact that the science I am supposed to teach, political economy, is often charged by mathematicians with not being any science at all, that it is simply a policy. I have been trying to get a definition that will rank me in the line of scientist. I think the definition is largely whether we apply accurate systems of measurement to the subject matter we are investigating. Possibly, if you do not care to work it out, it would be well for Mr. Delano to submit to you the definition he has proposed, and see if we can reach something more definite. Do you care to try to answer that question now?

Mr. S. E. THOMPSON. I think I might prefer to have the question submitted.

Mr. Reporter, will you read, please, that first paragraph of Prof. Commons's question? I am not quite sure that I agree with his premises there. That is the point.

The REPORTER (reading):

"As I understand you have adopted the word 'scientific' in order that you may possibly include all systems that you choose to pass upon as coming within a certain standard. Is it merely to make the public feel that you have some superiority?"

Mr. S. E. THOMPSON. I do not know that I have any definite criticism of that. I think you mean the question in the way that I would answer it. I would say briefly that the position you take is, it seems to me, one of the chief principles—accurate measurement. I would prefer to look over the definition further before submitting a definite answer.

Commissioner COMMONS. Could we substitute some word for "scientific management" that would tell us what we really have?

Mr. S. E. THOMPSON. There is just one point on that: That matter has been pretty thoroughly considered, and I question very much whether you can substitute any other term which better expresses just exactly what it is, whether this "accurate measurement" is not just that scientific principle.

Commissioner COMMONS. You spoke as though you would like to have the workman select the time-study man. Do you remember you said that? You said that you could not very well operate with two time-study men, one representing the employer and one representing the workman. You have dealt largely, I judge, with establishments that have already organized labor—that is, carpenters—and have made studies where they have organized labor?

Mr. S. E. THOMPSON. In part organized and in part unorganized.

Commissioner COMMONS. Is there any way by which a union already organized could propose to you a member of their union or a representative whom you would approve as a time-study man?

Mr. S. E. THOMPSON. I would be ready to take a time-study man from anywhere, provided he has the proper ability. For instance, I noted down here some of the requirements of a good time-study man:

First. He must have an analytical turn of mind.

Second. He must have the ability to think in terms of small units.

Third. He must have studiousness; he must be studious.

Fourth. He must have quickness and accuracy in mathematics.

Fifth. He must have good judgment.

Sixth. He must have tact.

If you can get that man from any source whatever, who is ready to take this time study and do it by scientific methods, I do not care very much where he comes from. But there must be the requirement, not that he comes from any one body of men, not that he comes from the employer or the labor union or anybody else, but that he has the proper qualifications.

Commissioner COMMONS. That is all.

The ACTING CHAIRMAN. We will resume the hearing at 2 o'clock this afternoon.

(Whereupon, at 1 o'clock p. m., the commission took a recess until 2 o'clock p. m.)

AFTER RECESS—2 P. M.

The ACTING CHAIRMAN (Commissioner Delano). The meeting will please come to order. Mr. Garretson, have you any questions?

TESTIMONY OF MR. SANFORD E. THOMPSON—Continued.

Commissioner GARRETSON. There are one or two questions I would like to ask, Mr. Chairman, just as a matter of information. While making up the time estimate of a man putting up the cornice or molding, I want to ask, does the man under those conditions work from a ladder or a staging? I notice that no time allowance was given governing either.

Mr. S. E. THOMPSON. He works from a staging.

Commissioner GARRETSON. Under those conditions, is that built by the laborer or the carpenter?

Mr. S. E. THOMPSON. In general, by the laborer, I should say.

Commissioner GARRETSON. Does the task and bonus or premium system, either one, contain within itself every element that enters into the piecework system, with more or less addition, as the case might be, every basic element that is embodied in the piecework system is embodied in all or any of these systems that are described by those two general names?

Mr. S. E. THOMPSON. I do not think I can answer so broad a question as that, not without giving considerable study to it.

Commissioner GARRETSON. Can you, then, name offhand any element that enters into the ordinary piecework plan that is not embodied in each of the others, with, as I have stated, more or less addition, bearing in mind that piecework itself is a very simple plan?

Mr. S. E. THOMPSON. In some of the systems I should say that the principles of the ordinary piecework system are included.

Commissioner GARRETSON. That is what I meant.

Mr. S. E. THOMPSON. As one of the features, but only as one, and not a fundamental.

Commissioner GARRETSON. Whether fundamental or otherwise, the real ideal of piecework is embodied in either one or the other, is it not, whether it is basic in them or not?

Mr. S. E. THOMPSON. I should like to ask you what you mean by the real ideal of piecework?

Commissioner GARRETSON. For a given performance to give some overpay, or a given amount of production, to use the phrase that has been used here largely.

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. If the same time system, or time allowance, secured by any means, stop watch or otherwise, was applied to the piecework system—that is, applied to these other systems that I have referred to—would it not work out exactly the same result, minus bonus or premium?

Mr. S. E. THOMPSON. In that question am I to understand that you think the bonus or premium is not included in the piece-rate system?

Commissioner GARRETSON. In the piece-rate system that is indirect; that is all. In the premium or bonus systems it is direct.

Mr. S. E. THOMPSON. In a properly applied piece-rate system you get the bonus or premium another way.

Commissioner GARRETSON. Surely you get it by day work, not by the ordinary piece-rate system?

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. You get it in another manner, in which the piecework is not essentially in evidence in producing the work, but would not the result in the earnings be exactly the same?

Mr. S. E. THOMPSON. I do not understand what you mean by exactly the same; exactly the same amount or exactly the same principle?

Commissioner GARRETSON. In amount, with the same time allowances and the same rate for allowance for the work; in other words, by the bonus system you get it by the payment of so much time and in the other you get it by the payment of so much flat sum.

Mr. S. E. THOMPSON. In certain forms of payment by bonus you would have exactly the same result.

Commissioner GARRETSON. Producing the same pay. For instance, a man bringing out locomotive cylinders in a machine shop, if he was allowed the same time under the piecework system that was equivalent to the money he was paid under the other system, the result would be the same amount of pay on the same turnout?

Mr. S. E. THOMPSON. On the other hand, as I said this morning, your commission should, I think, not spend too much time on differentiating between different methods of payment as to getting at the real basic principle. Now, if you get at the thing, the rate of payment, scientifically, on a scientific basis, and you base your piecework system on that scientific basis—the Link Belt, for instance, have a piece-rate system; and if you do that on this scientific basis, I would say that that piece rate was on scientific management, one form of scientific method.

Commissioner GARRETSON. My questions have no personal bias because I represent pieceworkers; are you aware of that. My men are pieceworkers.

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. But you talk about this being a detail; the larger portion of the exponents have condemned piecework as producing a vicious result, and lauded the other system as bringing a highly beneficial one. What guaranty is there that all the evils of the piecework system do not exist in the premium or bonus system?

Mr. S. E. THOMPSON. One of the chief evils, the fundamental evil in the ordinary piecework, is the fact that the rates are set by guess instead of scientifically. Now, if you have a piecework system and set the rates by scientific principles, then you have an entirely different proposition from ordinary piecework.

Commissioner GARRETSON. How can a scientific idea have anything to do with a day's wage and the rate paid therefor? How will you determine the basic day wage or the basic hourly rate scientifically?

Mr. S. E. THOMPSON. Your basic hourly rate does not come into your piecework.

Commissioner GARRETSON. It will come into the day's earnings and proportionally into the task and bonus or premium.

Mr. S. E. THOMPSON. Indirectly, yes.

Commissioner GARRETSON. And is not the day's wage the basis for an estimate of the piecework rate?

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. Now, surely scientifically, how can you get away from it?

Mr. S. E. THOMPSON. Get away from what?

Commissioner GARRETSON. The daily wage, or the basic wage.

Mr. S. E. THOMPSON. I do not want to get away from it.

Commissioner GARRETSON. And how can you scientifically fix the daily wage?

Mr. S. E. THOMPSON. I do not know yet of any way of scientifically fixing the base rate; that is, scientifically in the sense in which we are using it in general; it is more or less standardized, using standardization in an unscientific way by saying your base rate must be substantially the same as the base rate of wage, as in other establishments in the same locality, usually a little higher than the average wage.

Mr. THOMPSON. The term locality would not come in to such a great extent. I am not sure about that. I am not familiar enough with your conditions.

Commissioner GARRETSON. Train operation.

Mr. S. E. THOMPSON. Whether a man in the Southern States, where conditions are different, would have a different day's wage than those in the Northern States?

Commissioner GARRETSON. Take it the continent over, there is only 18 cents on a day's rate; it is \$1 in the East and \$1.17 in the West, and there is a variation yet. You notice I say that it has diminished?

Mr. S. E. THOMPSON. Yes, on construction work; it worked in the South a great many years ago, when we paid our negroes a dollar a day and the prevailing rate was 80 cents.

Commissioner GARRETSON. The word "locality" would apply entirely differently to a problem like mine, as compared with a shop which had only one location in a city?

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. Now, where would you find a scientific base for one that would apply to the other?

Mr. S. E. THOMPSON. That is the same problem, and I have never run up against it, and I do not feel that I have given it sufficient study to answer your question.

Commissioner GARRETSON. You lean somewhat to the belief that it would need some two or three years looking over before you could furnish the remedy?

Mr. S. E. THOMPSON. I am inclined to think it would take considerable study.

Commissioner GARRETSON. I do not mind confiding—this is under the rose—that I have been wrestling with it for 30 years and have not found the answer yet, although I have sweated, but I have not got it yet. Now, you made a statement a little while ago—I believe I could probably quote the exact language of it, although the copy is probably gone where we can not read it—that a good manager likes to pay high wages. Is that fairly correct? I think those are the exact words that were used.

Mr. S. E. THOMPSON. I think that is about what I said.

Commissioner GARRETSON. That conveys the idea?

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. How long have you dealt with employers on the wage proposition?

Mr. S. E. THOMPSON. Oh, for nearly 30 years, probably.

Commissioner GARRETSON. Does the average manager stop at liking to, or does he go further and pay them?

Mr. S. E. THOMPSON. I stated that principle not as a scientific fact, but as my opinion, and I still uphold that opinion. That opinion is based on conversations with a great many manufacturers and other employers of labor, and my experience with them; for example, I cited this place in North Carolina, where they paid the negroes \$1 a day in place of 80 cents. Now, that was not philanthropic; it was simply in order to get the best labor on that job, and they did get the best labor in North Carolina.

Commissioner GARRETSON. And to get them to work uninterruptedly?

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. There was an incentive. It was not for love of paying a high wage, but to attain an object, was it not?

Mr. S. E. THOMPSON. Yes.

Commissioner GARRETSON. I am glad you did not state this as a scientific fact, for I would have to lay down 30 years' experience against it, and we would have been down to the stage of two timekeepers running two stop watches at the same time. Bear in mind mine is the outgrowth of that many years' experience for large armies of men. I believe, like you, that the average manager likes to pay high wages, but he is not working at it.

Mr. S. E. THOMPSON. Do you make that statement from the standpoint of the railroads only or from your knowledge and experience and conversation with manufacturers and other employers of labor?

Commissioner GARRETSON. I would answer that in two ways—I make it absolutely upon my own experience with the contracting offices of the railway companies in one direction and upon second-hand knowledge in the other direction.

That is all, Mr. Chairman.

The ACTING CHAIRMAN, Mr. Weinstock, have you any questions?

Commissioner WEINSTOCK. You will have noticed, Mr. Thompson, there seems to be some very pronounced conflict between the representatives of organized labor on the one hand and the advocates of scientific management on the other hand on two points: First, a conflict concerning the feeling of the men who are working under scientific management. On the one hand we have heard the statement reiterated on the part of consulting engineers and scientific managers that the men generally working under the system like it and that they fight for it rather than against it.

On the other hand you have doubtless heard, in common with the commission, representatives of organized labor saying that the men protest against it and object to it and operate under it not from choice, but because they are obliged to do so.

At the best those things are opinions. This commission does not want to deal with opinions where facts are available. Can you suggest to this commission any scientific way of getting at the facts in that pronounced difference of opinion?

Mr. S. E. THOMPSON. Before I reply further I want to give one illustration that may have a little bearing on the disagreement. Whether it will have a bearing on the main question I am not sure.

About two years ago Mr. Lickner, my associate, set a task on a certain machine in a shop. It was the only task that had been set in that shop, and there was no other task set for nearly two years. When he set that task the man who was on this machine, a man who was working alone, was opposed to it. He did everything in his power to prevent Mr. Lickner getting all the information that he wanted to, aside from any open objection. It was perhaps the only case we ever had where there has been even as much opposition as that, although I would hardly call it by the name of "opposition" even there. But he did not take kindly, we might say, to doing everything Mr. Lickner asked him to do.

This spring Mr. Lickner happened to do some work in that same shop on some other machines which were something similar to this one I speak of. In doing that he had occasion to go down and take some studies on this same man who had been working for two years on task and bonus. This, by the way, was heavy work, handling heavy stuff, putting it on the machine, that really required a very muscular, strong man, and he had been doing this work for two years. The change in the man's attitude was very marked. Instead of doing things grudgingly, as he did before, he tumbled over himself, you might say, to do everything Mr. Lickner asked him to do, and even made suggestions as to ways of doing things better.

There is a question whether this does not have some bearing on the point you make—whether all the objections there are may come from the men who are just beginning to appreciate the thing and who are not on task and bonus themselves, and the other side of the question may come from the men in these particular shops referred to. I would not put that for a general proposition, because that has not been my experience, as I have said. But when the men do get used to it or when it is properly explained to them they immediately see the benefits and there is absolutely no objection whatever.

Commissioner WEINSTOCK. The point has been made, Mr. Thompson, and made this very morning, as you may recall, by Mr. Berres, that the objection comes from men who have been working under the system for two and one-half years in the Government shops. Two and one-half years is certainly a sufficiently long period for the men to be able to appreciate all its advantages and all its objections. As you will recall, Mr. Berres said they had protests from the men employed in the Government plants against the system.

Mr. S. E. THOMPSON. That, of course, was the statement made this morning. Of course it is a point which your commission will investigate here, to determine upon what that statement was based. I will admit, of course, that this has been the criticism that has been made at this hearing on that plant and one other plant. Your problem is to find a way to get at the truth of the matter, as to whether these objections are real objections, or whether they come from some men who are not on task and bonus at all, or from one or two men who are disgruntled, or from men who have for some other reason made the statement.

Commissioner WEINSTOCK. Do you think it would be a fair way, if it is practicable—there may be objections that do not occur to me—to go to a plant such as the Watertown plant and take a referendum in the nature of a secret ballot?

Mr. S. E. THOMPSON. I question very much whether you would get a fair expression of opinion, even in a secret ballot.

Commissioner WEINSTOCK. What should prevent getting a fair expression of opinion in a secret ballot?

Mr. S. E. THOMPSON. While I appreciate that the statements that have been made on this stand of the ability of the workingman to see through a good many questions, I am not sure but what he would be influenced, either one way or the other, to give an opinion that would be really contrary to what he actually felt—that is, for the good of the cause, you might say. He might have the opinion that it was for the good of his cause; it might be impressed upon him that it was for the good of his cause, if not for his own good. He might feel perfectly favorable toward it himself, but he might feel it was for the good of his cause to give expression the other way.

Commissioner WEINSTOCK. You mean he might be willing to sacrifice self-interest for the common good, or what he believed to be the common good?

Mr. S. E. THOMPSON. What he believed to be the common good. That is what you would find. You want the man's personal opinion.

Commissioner WEINSTOCK. Is there any other way, any other conceivable way, you can determine that?

Mr. S. E. THOMPSON. The question is, whether you could go into a shop as individuals and talk with the men without their knowing just what you represent. That, of course, would be questionable.

Commissioner WEINSTOCK. That is a problem that is coming to face this commission, if it is to decide the thing intelligently. My friend Mr. Garretson suggests the question whether you believe there are enough martyrs who are willing to sacrifice themselves to change what would otherwise be the result.

Commissioner GARRETSON. Not necessarily "Christian martyrs."

Mr. S. E. THOMPSON. As I say—and I still say—I question very much whether you would get a correct view, as you would if you could find some way of talking with the individual men, either in the shop or out, and finding out right from him, getting not necessarily what he says or the expressions he uses, but his real feeling in the matter.

Commissioner WEINSTOCK. That would not be a scientific method. If I undertook to do that personally, I might bump into 12 or 15 men who happened to have the same point of view, and it would not represent the majority. I might happen to interview a dozen men who were all opposed to it, and yet all the rest might favor it, and on the other hand I might interview a dozen who favored it and all the rest might oppose it. It seems to me that the scientific method would be to get the complete report.

Mr. S. E. THOMPSON. On the question of averages, if you selected at random a sufficient number, you would get a pretty good result of the whole.

Commissioner WEINSTOCK. The same issue has been raised regarding the physical effect upon the men. Can you suggest any plan whereby we could determine that as a fact, and not be obliged to deal with it purely as conflicting opinions?

Mr. S. E. THOMPSON. No; I can not, unless you can find some such record as Mr. Dodge brought here, of the notebook of a man, which gave his weights and his health at different periods, and unless you can find the records of establishments where the task work has been in use for some time, where they have not fallen down on the tasks. That is pretty good evidence. If you can find some shops or some managers, who have kept records of the tasks that have been performed over a long period of time, that is pretty good evidence.

Now, the way it will work, if the health of a man is failing or he is overworked, is that he will tend to drop down on his tasks. He will run along for a little with the tasks up to the limit, and then he will begin to fall off, after a certain period. It seems to me that that would be a way of getting at it that might give very definite facts.

Commissioner WEINSTOCK. In other words, we would have to depend upon shop records, if there are any such shop records available?

Mr. S. E. THOMPSON. Yes. No; I would say that would be one very important way of doing it.

Commissioner WEINSTOCK. Do you know of any other way that might be suggested?

Mr. S. E. THOMPSON. I do not think of any at the present time.

Commissioner WEINSTOCK. Can you tell the commission whether the determination of the daily wage is arrived at in any different manner under scientific management than it is where scientific management does not prevail?

Mr. S. E. THOMPSON. No; except where scientific management prevails there is apt to be more attention and study given to that point. For example, in certain establishments they have a certain particular man who hires all the men, who has to do with the discharging and any disciplining that comes up. Now, he can size up the men who come to him and get a better basis and a more equitable wage than under the ordinary method.

Commissioner WEINSTOCK. How many plants are you familiar with where that system is in operation; that is, plants where you know of the conditions, and are familiar with them?

Mr. S. E. THOMPSON. From a personal knowledge, I do not know that I could say over a dozen, anyway.

Commissioner WEINSTOCK. Aggregating how many employees, about?

Mr. S. E. THOMPSON. Possibly under 10,000.

Commissioner WEINSTOCK. About 10,000?

Mr. S. E. THOMPSON. Yes, sir.

Commissioner WEINSTOCK. Under those dozen shops what proportion, if any, fix the wage by individual bargaining, making an agreement with each individual man, regardless of what the others may get?

Mr. S. E. THOMPSON. That I could not say. In mentioning this number, I am not intimately enough familiar with that department of the question to make a statement. In certain of the shops there are unions, and the rates are the base rates of the union rates or sometimes above the union rates.

Commissioner WEINSTOCK. You are not, then, in a position to answer that question?

Mr. S. E. THOMPSON. Not in a way that would be of advantage to you.

Commissioner WEINSTOCK. What evils in the piecework system does the time and bonus system overcome?

Mr. S. E. THOMPSON. One of the great evils that it overcomes is this constant friction and fight between the men and the management as to the piece rates. The ordinary method of fixing piece rates is for the superintendent and the foreman to get together and decide on how many pieces a man ought to turn out a day, and fix the rate on that basis. After he has worked on for a little while, if he exceeds the number of pieces to a larger degree than the managers consider is fair, or to a degree that produces enough to give him a very high wage, they cut the rate. Now, after one or two cuts of that kind the employee very properly fixes a certain rate that he will work under, and he accomplishes that particular rate day after day. It may be a fair rate; it may not be a fair rate. Occasionally some one will come and speed up on that particular job, and then the rate will be cut again. There is that continual friction. The men are not trying to do a good job, they are not trying to do a fair day's work. It affects them from a moral standpoint, and that, I should say, was the principal objection to the ordinary piece rate; except that that is a tendency to overspeed in certain cases, especially when the task is fixed too severe.

Commissioner WEINSTOCK. When you come to me as an employer, as for example, as a consulting engineer introducing a system, in all likelihood you would say to me after the bonus had been established, "My advice to you is, do not cut this bonus."

Mr. S. E. THOMPSON. Decidedly.

Commissioner WEINSTOCK. Despite the fact that the men seem to be earning abnormal wages?

Mr. S. E. THOMPSON. Yes.

Commissioner WEINSTOCK. That would be your advice and counsel to me?

Mr. S. E. THOMPSON. Yes.

Commissioner WEINSTOCK. But would there be anything to prevent me, despite your advice and counsel, from cutting the bonus?

Mr. S. E. THOMPSON. The great objection, the great consideration which would prevent the cutting, would be that it would disorganize the shop and create friction between the men and the management. Just as soon as you began to fix new rates they would soldier and use every way possible to prevent your getting a fair rate on it, and would destroy one of the principal functions of scientific management. In other words, you would have unscientific management, because that is one of the fundamental principles.

Commissioner WEINSTOCK. Well, granting that that would be so, it would not be any more so than when you cut the price in piecework? Does not the same law apply to both systems? That is, if you will not cut the price of piecework, but let men work at their full capacity and earn whatever they can earn, however abnormal it might seem, you have the satisfaction and contentment. On the other hand, if you cut the bonus down, you have the same dissatisfaction as if you cut the price on piecework? It is the same law operating in both systems?

Mr. S. E. THOMPSON. No; because when you cut the piece price, as I have mentioned, it is almost invariably because it was set too high, and the men can readily do the amount and earn a fair day's wage even after the price is cut. Now, if your rates are scientifically fixed, be it piecework or taskwork or bonus, then if you cut them, a man has to do an extra good day's work for ordinary pay, and you can not compel a man to do an extra good day's work for an ordinary day's pay. It is against human nature.

Commissioner WEINSTOCK. I see. That is, under the piecework system there is liable to be water in the price, and when you attempt to squeeze out that water you have difficulty. Under the bonus system the price has been arrived at so scientifically that there is no water to be squeezed out?

Mr. S. E. THOMPSON. Yes; assuming that by the piecework system you mean the ordinary piecework.

Commissioner WEINSTOCK. Yes. May I ask whether you have confined your endeavors to scientific management, or whether you have familiarized yourself with labor conditions generally as an economist and as a sociologist?

Mr. S. E. THOMPSON. No; I have not gone into that side of it at all, except indirectly.

Commissioner WEINSTOCK. Have you studied the problem as to how to create a more cordial and more friendly feeling between capital and labor, and establish better general relations?

Mr. S. E. THOMPSON. No; I have not studied that problem. I find that it works automatically, you might say, when you carry out the system properly.

Commissioner WEINSTOCK. You may have been here the other day when Mr. Williams was on the stand. Do you remember his testimony?

The ACTING CHAIRMAN (Commissioner Delano). No; that was last week.

Mr. S. E. THOMPSON. No; I was not here.

Commissioner WEINSTOCK. The question was put to Mr. Williams as to what he regarded as the missing link between capital and labor, and he being a mediator and arbitrator said, "I am the missing link." I assume if that question was put to you you would say this system was the missing link?

Mr. S. E. THOMPSON. I am afraid I am not enough of an economist to answer that question.

Commissioner WEINSTOCK. Then you do not know what the missing link is?

Mr. S. E. THOMPSON. I would say that scientific principles go a long way toward smoothing over difficulties.

Commissioner WEINSTOCK. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Lennon, have you any questions?

Commissioner LENNON. I have just one question, which might lead to another one. If in this job you speak of here the time is set at an hour and a half or an hour and 18 minutes, and it is completed within that time, you would pay 30 per cent more than the basic wage; was that it?

Mr. S. E. THOMPSON. Yes, sir.

Commissioner LENNON. If it is done in very considerably less than an hour and 18 minutes, why is there an additional bonus given; that is, in addition to the 30 per cent?

Mr. S. E. THOMPSON. That is no more than fair to the man. If he does an exceptional day's work there is no reason why he should not have an increase in pay.

Commissioner LENNON. And that is not done with the idea of speeding the men up?

Mr. S. E. THOMPSON. No. A man is expected to do just about his task. As a matter of fact, they do that. I have some figures here on some work, showing the comparisons, taken from an actual job. These figures are on different operations; different numbers of pieces. We have here: Actual time, 5 hours and 12 minutes; figured time, 5 hours 34 minutes. There is a difference of 22 minutes. Here is another one, actual time 2 hours and 42 minutes; figured time, 2 hours and 45 minutes.

Actual time, 1 hour and 15 minutes; figured time, 1 hour and 4 minutes.

Actual time, 2 hours; figured time, 2 hours and 5 minutes.

Actual time, 56 minutes; figured time, 54 minutes.

This is taken from a letter written on July 25, 1912.

Commissioner LENNON. That is sufficient. No—just one other question.

If this hour and 18 minutes is reached as a fair basis for a man to do that work, in the interest of humanity is it advisable to either offer a bonus or anything else to promote his doing it in three-quarters of an hour?

Mr. S. E. THOMPSON. If you had men who are identical in capacity and muscle and intellect, that would be the case; you could fix a task and say that they should do it in just that time, and no more and no less; but if you have a man who is especially adapted to the work—better than the rest of the men in that particular job—and it is possible for them to do it in a shorter time with very little exertion, he should be permitted to do it, just as you and I are permitted to do a big day's work if we feel like it, and we do it.

Commissioner LENNON. That is all.

The ACTING CHAIRMAN. Mr. Commons wants to ask you one or two questions.

Commissioner COMMONS. I understood you in answering Mr. Weinstock, or Mr. Garretson possibly, to say that the wage basis is a matter which can not be scientifically ascertained as yet; that there is no method worked out that

ascertains scientifically the wage basis. That is to say, whether a man should start in, say, at \$3 a day or \$2 a day.

Now, take the vicinity, and take the best judgment of what the current base rate should be.

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. You think that should be worked out more scientifically?

Mr. S. E. THOMPSON. Yes; I think it will be worked out more scientifically some time.

Commissioner COMMONS. So that in that case the employment office of the establishment should have a functional man for hiring people, you think?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. And then he has full power to determine the wage base for each man that he takes on?

Mr. S. E. THOMPSON. No; the man who is hired has an equal or greater say.

Commissioner COMMONS. Take in a case like this: I know an establishment, and you probably know the same, where girls are employed, and the record has been that the girls make about 20 per cent premium or bonus. That is, if they are hired at 12 cents an hour, they ordinarily, on the average, will make 2½ or 3 cents additional per hour under the premium or bonus system, and that brings it up to 15 cents, we will say.

Now, the employment office always uses that—and this is the result of my interview with a certain employment man in a very large establishment—he says that that is a good talking point. He says, "If I am making an employment for a girl I would say to her, 'Now, if we take you on at 7 cents, we have a bonus system here by which you will be able to make 15 cents.'" Now, he says that is a good talking point, and that she would just as soon go on at 11 cents and make this bonus, and that would still bring her up above her 12 cents. Or she might go on at 10 cents, and by making a 20 per cent premium, she would come out at 12 cents.

Now, is it not a matter of fact that this functional foreman, the great advantage which he has to a large firm, he being a specialist in the labor market, he knows how to deal with these thousands of people that are at the gates—is it not a matter of fact that he will use this bonus or premium as a talking point to reduce the wage base? Have you had experience or knowledge of that being done?

Mr. S. E. THOMPSON. No; I have never had any experience or knowledge, or heard of that being done before. In a way, of course, at the same time, if he gave that girl to understand that in order to earn that high rate she had to do a great deal more work, there would not be exactly justification for that, but it would not be especially objectionable if he told her all the facts. If he made it simply as an inducement, without stating the other side of it, I would say he is hiring her under false pretenses.

Commissioner COMMONS. No; he is an honorable man. I have spent some time in making his acquaintance. He simply employs some 20,000 people or so a year, and he explained the whole system to me very fully. He hires several thousands of girls, and he says he always tells them that this system was based on 12 cents or 10 cents, and "You are supposed to get out a certain amount." He explains it very fully to them; there is no question about that. I suppose he takes but a short time to explain it, there are so many, but they all go in on that basis.

Now, how can you make that man or that employment office or that functional position there scientific? What is there in the science of management by which you can standardize that man and he could not be prevented from using this premium as a talking point to reduce the wage base?

Mr. S. E. THOMPSON. As I say, I have not given that point consideration.

Commissioner COMMONS. One point of your function, then, would be to educate him and train him?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. And get him into this new spirit?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. So that it is likely that the wage base may be jockeyed with in this way. I know that it is by observation and from opinion.

Now, as to the other question, with reference to the question that Mr. Weinstock asked you—

Mr. S. E. THOMPSON. Just one point on that: In a properly managed shop, even if that did take place, after that girl got into the shop, if she was worth

more than that base rate at which she was hired, she would be changed over to some other shop which gave her the benefit of a higher rate.

Commissioner COMMONS. Would the scientific system automatically change her over without judgment or discretion on the part of the individual who had the authority to make the change?

Mr. S. E. THOMPSON. Perhaps not absolutely automatically.

Commissioner COMMONS. In order to be scientific, you have got to cut out human judgment and human will and human discretion in this matter, if I understand what is meant by "scientific." But what I am trying to get at is whether it is to be absolutely automatic.

Mr. S. E. THOMPSON. It would be automatic in this way, that the records of the girl would be kept, and when they wanted a girl for another position they would go to the records and find the best girl to put in that place. They would have the information to base their judgment on, instead of its being a haphazard method, at the will or favoritism of the foreman.

Commissioner COMMONS. In this establishment, to which I refer they have a very complete system of individual cards, so I presume they utilize that system.

As regards the other subject that Mr. Weinstock suggested, regarding the cutting of the bonus, as I understand the bonus in the illustration given us, if he comes up to the standard time the bonus is 30 per cent, and you answered that you would advise him not to cut the bonus, that it would be unscientific to cut the bonus. I do not know that I need to follow that question out, because I think it is perfectly plain what would happen in times of great improvement. I think perhaps if you would take such a business as the steel industry, and suppose they had this system in effect 20 years ago, that the enormous improvements which have been made would inevitably cause them to make some new time studies, and they would have to bring both the base and the bonus down.

Mr. S. E. THOMPSON. No; they would not bring the bonus down.

Commissioner COMMONS. They could bring simply the base down?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. By bringing the bonus down they could save 30 per cent, and that is all they could save?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. That is the maximum?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. But this task system has been figured out upon the man turning out a certain number of pieces in a day's time—we will say in 10 hours.

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. We will say the task has been figured out on 100 pieces in 10 hours. It seems to me quite plain that the employer would not cut the wage base \$3 a day. He would not get much advantage there; nor would he get much advantage in cutting the bonus, or at least a very small advantage. But where he would get his advantage would be when he finds that this man is making a large sum of money, that in the next shop order that went out to that man, instead of having 100 pieces he might have 500 pieces as a task. I know a case where something quite similar to that happened in a very large establishment having 5,000 employees. The orders did not come out as an order for one piece, but they came out in bunches of 100 pieces: "Finish 100 pieces at this rate." This man got up to \$7 or \$8 a day. He was an ordinary, common laborer. The next order came to him just double the number of pieces in that task. Naturally that might accomplish three or four times as much as could have been accomplished by reducing his daily rate. He started in at \$2, we will say. He would have gone on a strike if they had cut the \$2 down to \$1.50, or if they had cut the bonus from 30 per cent down to 15 per cent. But in this rather subtle way that he could not quite comprehend they simply doubled the task on him, and there they actually reduced the rate one-half.

What is there, automatically or scientifically, without the judgment of the boss, that would prevent that increase of the task?

Mr. S. E. THOMPSON. In the first place, I do not quite agree with you on this being a subtle increase. I think it is perfectly surprising how a workman in a factory can figure out just what is coming to him. Sometimes you would think it took higher mathematics to do it, but they can do it, and I do not believe this man was fooled by that plan any more than if you cut his wage right on top of his bonus. Of course, occasionally the fixing of a rate might involve the making of a mistake, so a man will earn too much; that mistake

may happen. About the only way is to keep on paying the man the high rate. I know a great many employers will do that. In certain cases where there is a change in the method—suppose, for instance, that is done by machinery and that increase is accomplished by changing the machine; that is a different proposition. The man is not entitled to that raise if it is simply a change in the machine, which does not make him any extra work.

Commissioner COMMONS. I am not counting that into these three instances. I am assuming the first rate can be fixed right, but I am trying to find out, after that has been fixed, whether there are not really three points there that are left to discretion and not to scientific determination—that is, the wage base, the bonus, and the amount of the task—and what there is in the system to prevent these three things being changed.

Mr. S. E. THOMPSON. In the case you name, it shows right on the face of it that the task was not properly set in the first place, and I suppose you acknowledge that and simply say in this particular case the man made a mistake. That rarely occurs where you have the proper task setter, but I will admit that every one is liable to make mistakes. There is no reason why that should be cut, even then. It is usually better to just keep on paying it. If it is cut, the way to do it would be to go to this man and take it up with him and put it up to him as to whether it was a fair thing to do or not. It is a general principle not to cut a rate, even if it does run away with you.

Commissioner COMMONS. That is a principle, a moral principle, we might say, and not an automatic principle; not what I would call something that you can fix and set in a chart, because it means simply the change of the chart, and there is still left there some discretion.

Mr. S. E. THOMPSON. The plan that I usually use in fixing rates would not permit of that increase, and so I would prefer not to answer that question any more definitely, because I do not feel I am competent to do it. It is something I have not come across.

Commissioner COMMONS. I certainly think you are right in stating that these instances I have given were not based on accurate time study. I know, as a matter of fact, they were not, so that my inferences can not be raised as an objection to accurate time study, if that can be made—that is, the man would not have been making such a large bonus. I do not think, however, it would meet the other point; that it can be used as a talking point in getting them to consent to come in on a lower wage basis.

But, granting that, and taking it up under the scientific system, where it is actually measured by time, and we do get it automatically as near as possible, is it not a fact that there is no industry as yet in which scientific management exists in all of the competing establishments?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. In what industry would you think it has spread to the largest extent? Has it covered 10 per cent of all the output of any particular industry?

Mr. S. E. THOMPSON. I do not think there is any industry where it would cover anything like 10 per cent.

Commissioner COMMONS. Then we will say the best we have now is the industry in which 10 per cent of the establishments have scientific management, and 90 per cent do not—all being competitors producing the same article.

The 10 per cent would be, as I think Mr. Dodge illustrated very well the other day, able to keep steady employment for their people and to make a larger profit, or at least to get a good, fair profit, because he can undersell his competitors. That is what scientific management has done for him. It has enabled him to undersell his competitors.

Suppose we gradually extend this scientific management to his competitors and gradually reach the point where there will be a number of competitors who do not adopt scientific management, who will drop out and go into bankruptcy. The others that protect themselves against him will have to adopt scientific management. They will all finally reach the point when the only people in the industry are those who have scientific management. Then we will have a situation, not of Mr. Dodge underselling people who do not have scientific management, but of scientific-management competitors underselling each other.

In order to do that successfully—and I am assuming they do not form a trust—their profits will have to be coming down. This 12 per cent will go on down to 10 and 9 and 5 and 4, and when it gets down to about 3 per cent they will have to look for some other source in order to undersell their competitors. What other source can there be, except either the bonus to the workmen or

the wage base to the workmen or an increase of the task to the workmen when it is universalized?

Mr. S. E. THOMPSON. Of course the fixing of the final wage is an economic problem that I do not consider myself fitted to go into. There are one or two things, however.

In the first place, I have said over and over again that you can not expect a man to do an extra day's work for an ordinary day's pay. In order to keep up the production, as you will have to do, you have got to continue to pay him what is a good, big day's pay. It may not be in this case any bigger than your competitors, but it will be a good day's pay.

On the other hand, if you put these different shops under scientific management you have the same similar results to what you have in the introduction of machinery; you produce more wealth, and the general tendency will be for the workers to take a good slice of their profits from that increase in production, so that naturally the wages will tend to go up rather than tend to go down.

Commissioner COMMONS. So that it resolves itself into looking ahead into the future and seeing whether the whole benefit of this is going to be absorbed by the consumer in low prices or whether the wage earners are going to save for themselves a part of it.

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. In shorter hours and higher wages?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. So that in the long run we will have to decide at the start, when we begin to install scientific management, whether we proposed to strengthen the laborers' bargaining power in the installation of this thing, so that he can prevent the consumer from getting it all away from him?

Mr. S. E. THOMPSON. No; not necessarily, because the strengthening power of the labor will rise as the man grows, will it not?

Commissioner COMMONS. Well, it is a question there; of course it is a mooted question which would have to be solved by science and statistics, as to whether and to what extent the labor has shared in the benefits of machinery and to what extent that has been owing to his organizations or to other forces. But my point was, to come to the question of scientific management, to the point where we must look to the ultimate issue, in the final analysis, as has been discussed, and it seems to me that the situation comes to this simple point, that scientific management, no more than day wage or any other thing, can automatically prevent the final contest between labor and capital on those three points—the wage base, the bonus, and the amount of the task.

Mr. S. E. THOMPSON. I disagree with you entirely on that if by a contest you mean warlike contest. I believe there will be a contest. I believe that these principles of scientific management and getting together have engendered both in the workman and the employer and will tend to make that a peaceful conflict which will be settled without the troubles that occur where there is continual friction between them.

Commissioner COMMONS. Then, would it not be essential if you are going to have it a peaceful contest, that they take it up and work it out together?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. As organizations or individuals?

Mr. S. E. THOMPSON. I presume it would be through some form of organization.

Commissioner COMMONS. That could not be allowed to wait until the system has been installed? They would have to take it up at the time of installation?

Mr. S. E. THOMPSON. I do not quite understand you; I thought you were talking about the general economical principles, of ultimate wages. Now you are speaking of the installation of the system.

Commissioner COMMONS. That is the question.

Mr. S. E. THOMPSON. You based your argument on the question; your premise was, as I understood it, that all these questions of that kind were under scientific management.

Commissioner COMMONS. That led me to the next question, which should be separated from the other, brought out by the testimony of Mr. Mixer. You remember what he said, that this system could not be installed in a collective way and we would have to wait four or five years before we had collective bargaining to deal with it. My notion of it is simply this, that the laborers will not be forced to demand collective bargaining until the wage base and the bonus began to be decreased, until the task begins to be increased; then labor

will be forced to organize in order to prevent that; now, that will come when the scientific management is diffused enough through the industry to cut into the profits of the employer?

Mr. S. E. THOMPSON. I would not say that it would, but I will say that it might.

Commissioner COMMONS. It might?

Mr. S. E. THOMPSON. Yes.

Commissioner COMMONS. And if this commission is required to investigate the causes of industrial unrest and to look forward as well as backward, we should naturally be compelled to expect that in the case of scientific management there would come a time when it would not necessarily bring industrial peace, as it does now, and that is only in a few establishments.

Mr. S. E. THOMPSON. I should consider that you had industrial peace if this agreement was settled in an amicable manner; in my opinion that is what you would have. I do not quite get at your point.

Commissioner COMMONS. What I am trying to get at is whether we should try to work out some system to anticipate this future struggle, after scientific management has been diffused, to try to install it in some collective way that it would have to be carried on after five or six years after it had become diffused.

Mr. S. E. THOMPSON. I think we would make a great mistake if we cross these bridges before we come to them. I believe ultimately there will be no force that will be so potent to the bringing into use of scientific management as the laboring man himself. We see that from the way they feel about it, according to my experience and the experience of most others, the way they feel about it, when they really get hold of the thing. Now, on the other hand, just at the present time, and for some years to come, when the condition is more or less chaotic, and the laboring men have not as yet had an opportunity, no more than the employer, to study out this question, it seems to me that you are altogether too much ahead of the times if you endeavor to formulate rules for conditions that will apply after these ultimate conditions have taken place, which will not be for many years.

Commissioner COMMONS. I have one other thing in mind with reference to that. You were asked by Mr. Weinstock as to what confidence you could have in the evidence that men in the shops would give, whether they were speaking for their own individual value that they put on this system, or were standing out for the good of the cause. Now, as I understand it, the trade union is what you mean by standing out for the good of the cause; that is, they would subject their individual benefit for the good of their fellow workmen?

Mr. S. E. THOMPSON. What they considered was for the good of their fellow workmen.

Commissioner COMMONS. Perhaps they in that have some sort of instinctive foresight into the future; that is, not the present workmen, but that it is for the future of their trade, the future of the industry, and might it not be that these workmen, having gone through this same experience with piecework and always having had it work out in this way, might instinctively feel that this scientific management is going to work out in this same way, and that the cause he is standing for is the future cause of labor as well as the present cause of his fellow workmen?

Mr. S. E. THOMPSON. Yes; but on the other hand it might be due also to the fact that there is certain pressure brought to bear on them by men who were not on the bonus system, who might believe that, without having any basis for their belief, and not having actually worked under the task and bonus, and would not have a fair basis for making their opinion.

Commissioner COMMONS. And if they convert him they would say, "This is only a temporary gain you are getting; after a while competition will take it away from you," and that would be one of the things he would be looking out for, for himself in the future, to that competitive period when the whole thing has been diffused. But I will not follow that out any more; I just wanted to bring out whether we should not have these fundamental questions in mind as well as the machinery of scientific management.

Mr. S. E. THOMPSON. Yes, provided you do not cross bridges too far ahead.

The ACTING CHAIRMAN. Mrs. Harriman left a question which she wanted to know if you would kindly answer. She wanted you to give your definition of the difference between bonus, premium, differential rate, and piece rate methods of payment. You need not do this orally, if you would be willing to give your answers in as succinct a way as possible, stating in writing what your definitions are of those.

Mr. S. E. THOMPSON. I will write some kind of a general description.
The ACTING CHAIRMAN. Are there any further questions?
Commissioner GARRETSON. I have no more.

TESTIMONY OF MR. N. P. ALIFAS.

Mr. THOMPSON. Will you give us your name, residence, and occupation?

Mr. ALIFAS. N. P. Alifas.

Mr. THOMPSON. And your residence?

Mr. ALIFAS. 120 Maryland Avenue NE, in the city of Washington, D. C.

Mr. THOMPSON. And what is your occupation?

Mr. ALIFAS. I am the president of District No. 44, International Association of Machinists. District No. 44 comprises the machinists employed in the Government service.

Mr. THOMPSON. Everywhere in this country?

Mr. ALIFAS. Yes; it comprises the machinists of the arsenals and navy yards, and the Government departments here at Washington, such as the Government Printing Office, the Bureau of Engraving and Printing, the Lighthouse Service, and the employees on the Canal Zone.

Mr. THOMPSON. How long have you been in that position?

Mr. ALIFAS. Since December 1, 1911.

Mr. THOMPSON. In that time you have come into contact with so-called scientific management, or so-called efficiency systems?

Mr. ALIFAS. I have.

Mr. THOMPSON. What is your general attitude toward scientific management, and what are the reasons therefor?

Mr. ALIFAS. Do you wish me to give you a general statement of our objections to it, and why we object to the different things?

Mr. THOMPSON. I wish you would briefly state it, if you will.

Mr. ALIFAS. Our objections are these: We object to the system of scientific management as a whole on account of the way it is built up, and we also have specific objections against certain features of it to which we would object even though they were segregated and were acted upon apart from the system as a whole. Our principal objections to the system are its possibilities, and the sort of limitations that are placed upon the possibilities of the system. The principal features of the system that we object to are the time study, the stop-watch time study, the premium system, the system advocated by certain of the scientific engineers, of hiring cheaper men to do the character of work that has been formerly done by highly skilled men. We object to the very severe disciplinary system that goes with it.

It must be understood that any complicated system in order to work, in order to make everything come just right, has to have a very severe system of discipline in order to make it do that.

We object to the elimination feature of it.

While labor does not object to improvements, to good management, we think that before any very drastic changes should be brought about some provision should be made for those who are going to be inconvenienced by such changes.

Those are just some of the objections. I can explain in detail or a little more specifically why we object to these different items that I have brought out.

Mr. THOMPSON. I should like to hear that. Take the first in order, the possibilities of the system. Why do you object to those?

Mr. ALIFAS. I do not know that the possibilities of the system ought to come first in order, because the explanation of some of these other questions might perhaps be necessary in order to explain the possibilities, but I will go on with that.

Mr. THOMPSON. I simply took that first because you stated it first. Start with the one that will unfold, in your opinion, naturally.

Mr. ALIFAS. I could just briefly touch on the possibilities, in order that you might understand the others also.

The question of paying men bonuses is, of course, a method of endeavoring to get them to do more work—to do as much as possible—and all the expedients that are explained, in principally Mr. Taylor's work, are in the direction of increasing the output of the individual workman and offering him as many stimulants to increase the output as it is possible to get him to stand for or as circumstances will permit.

Now, take piecework for an example. That, of course, is not a part of the scientific system, but it is more strenuous than daywork that the machinists

whom I represent, in particular, are now working under. We think that the system of daywork is sufficiently severe and furnishes sufficient inducements to induce the average employee to work as hard as he ought to be compelled to work, and if you give him any more stimulants than that that he eventually is going to overwork and shorten the years of his life, probably 10 or 15, or even more than that.

The premium system is still more intense than the piecework system, and I should like to explain the difference. I do not believe that has been brought out here; that is, it has not to my way of looking at it. We will take the way the premium is arranged at the Watertown Arsenal, in regard to which I have some information. We will say that the time study has indicated that 100 pieces can be made in 36 minutes. As a premium, or as a time within which premiums shall be given, they will set, say, an hour, which is 40 per cent in addition to the lowest possible time, and they will give one-half of the man's rate per minute for every minute that he saves under the hour.

Mr. EMERSON. Might I interrupt, Mr. Chairman, to ask whether it would not be better to define the terms "premium" and "bonus"? The witness is testifying about the bonus-system and calling it a premium system.

Mr. ALIFAS. I am talking about the premium system.

Mr. EMERSON. Not as we know it.

Mr. ALIFAS. I am talking about the premium system.

Commissioner WEINSTOCK. Do you use "premium" and "bonus" as synonymous?"

Mr. ALIFAS. No, sir; I know very well what I am talking about.

The ACTING CHAIRMAN (Commissioner Delano). Is this the Taylor system?

Mr. ALIFAS. It is the Taylor system.

The ACTING CHAIRMAN. Mr. Taylor and his men have been talking about his system as a task-and-bonus system.

Mr. ALIFAS. Yes.

The ACTING CHAIRMAN. Is it a task-and-bonus system, or are you really describing the premium system?

Mr. ALIFAS. It is the task system with a premium.

Mr. EMERSON. With a bonus.

Mr. ALIFAS. With a premium. [Laughter.]

Mr. BARTH. Mr. Chairman, I installed that system. What is the use of listening to everybody else and not giving me a chance? I am all right.

The ACTING CHAIRMAN. I think we will hear the witness.

Mr. BARTH. I think that is mighty funny.

Commissioner O'CONNELL. Let Mr. Alifas go along in his own way. He knows what he is talking about.

The ACTING CHAIRMAN. I think we will have to let him go along. Evidently you have not been here, Mr. Alifas, all the time. Mr. Taylor and his men have been careful not to use the word "premium" in describing their system, but they use the words "differential piecework" and "task-and-bonus system" in describing their methods.

Mr. EMERSON. That is the reason that I asked this witness if he would not kindly define those terms for us for the benefit of the commission.

Mr. E. S. THOMPSON. May I answer that one point now, since you asked me that question?

The ACTING CHAIRMAN. I do not think we should interrupt the witness now.

Mr. THOMPSON. I will ask this witness to define what he means by these terms. That will simplify the thing, so far as he is concerned.

The ACTING CHAIRMAN. If you will define what you mean by "premium," as you are using it, we would like to have you do that. You may not be using it in the same sense in which others are using it.

Mr. ALIFAS. I mean at the Watertown Arsenal they call this premium the money they make in the plan that they have inaugurated there. I was endeavoring to describe that plan. If they made 100 pieces in 36 minutes and they were allowed an hour to make those pieces, the plan is that for every minute that is saved within the hour the workman shall be paid for a half a minute. Under the piece system, if a man has been given a task that he would take an hour to do, he will be paid, say, 5 cents apiece, and for every piece he makes more than that, he will be paid 5 cents apiece. If an employee under this system that is in vogue at the arsenal should complete that particular job in 36 minutes, he would get more for that same amount of work than he would if he worked an hour on it. If he worked an hour on this particular piece, if he was getting 30 cents an hour—I mean 30 cents for the 100 pieces—he would

get 30 cents, but if he completed that within 36 minutes he would get 30 plus one-half of the amount of money he would save by shortening the time 24 minutes, which amounts to about 40 cents for the 100 pieces. Consequently it is to the man's interest to increase the price that he gets for the particular amount of work that he is doing. Now, in that it is more intense than the piecework system is.

Another way of stimulating men which, I understand, is to follow this particular plan which I have called the premium system. It may be different from what these other gentlemen claim is the premium system, but that is what we call it at the arsenal—a differential-rate system, with a bonus. Whenever they have finally discovered how much a man can do of a certain amount of work, they place that at as low a limit as they think they can get a man to work for and still make it. I suppose that if they should discover that a man, by very strenuous efforts, could make 10 of these given pieces in a day, they would say, "If you can make 10 of these in a day, we will give you 35 cents apiece. If you do not come up to 10; if you only make 9½"—or whatever the tolerance will be—"we will give you only 25 cents."

The question of only a very few minutes of speeding up during the day might mean the difference between getting \$2.50 a day or \$3.50 a day. If a man misses that \$3.50 a day by only 10 minutes, he would regret that very much, and he would be willing to speed himself up considerably harder in order to make that. That is an added stimulant—added onto the man.

Then you can stimulate him still further. These systems provide for a system of eliminating men, and eliminating the least efficient of them, and in view of the fact of their supposed increased production, so they do not get as many men to do the same amount of work that they have been doing, it is possible to discharge quite a few men every once in a while, as the system becomes perfected and they can get along without them. While they are discharging these men, they might as well turn it into an advantage and say, "We will keep the best of the men, and those who can not keep up, of course, will have to go." That is natural. They will say, "If you men do not make these premiums or bonuses that we are offering to you, if you will not work hard enough to get them, we will eliminate you." That is an added stimulant, especially at a time when there is very little work in the country, and the men will work still harder.

A foreman might not be disposed to press that point as hard if he is working himself under a salary, as if he were under a bonus or premium for doing that sort of thing. Mr. Taylor's system especially, and I think most of the other scientific systems, provide that a foreman shall be paid a bonus in proportion to the number of his men who are making bonuses. Consequently that gives him an incentive to speed up his men in order to force them to make bonuses. There are two ways of doing it. You could give a foreman a bonus for the number of men who were making premiums, or you could regulate the size of his premium in accordance with the amount of premium or bonus his men were making. This last particular, of course, would be more stimulating to him.

We feel that there is altogether too much stimulus connected with that. You might say, "Oh, they would not do that. Our employees are too tender-hearted to be willing to enforce such an inhumane system of oppressing people." I would feel very much disposed to give them credit for their very best intentions. However, we have to be guided somewhat by what they say they will do. Mr. Taylor, in his presentation of this subject before the American Society of Mechanical Engineers, in June, 1903, gave an outline of his system. It was at least just as harrowing as what I have just related, in our opinion. He not only advised them to do that, but he showed where he had done that, to prove that it was possible to do it.

In presenting a subject of that kind in the way that Mr. Taylor did, since he has had enough experience with employers to know what would appeal to them, I presume he wrote this paper in such a way as to appeal to the average employer. If that sort of language is what is going to appeal to the average employer, I think that the working people might put up a good strong resistance to any program that is going to work out in that fashion.

MR. THOMPSON. Have you that language here?

MR. ALIFAS. Yes, sir. In regard to keeping the cheap men, I will read a paragraph to illustrate that point from Shop Management, page 1347, paragraph 37:

"By 'high wages' he means wages which are high only as relating to the average of the class to which the man belongs, and which are paid only to those who do much more or better work than the average of his class. I would not, for illustration, advocate the use of a high-priced tradesman to do the work which could be done by a trade laborer or low-priced man."

In explanation of that, he figures that by systematizing the shop and taking advantage of all the modern improvements that he has incorporated in his system, it is going to so simplify the work that it is not going to be necessary to have the skill of the mechanic who formerly had to do it, but that he can dispense with him and use a laborer or a skilled man who gets much less pay, and that the increase that he would be giving the employee would not be an increase to the mechanic who was displaced, but would be an increase of a certain per cent to the laborer, and an increase in the laborer's wages would not amount to probably as much as the mechanic got who formerly did that class of work.

Mr. THOMPSON. Referring to that last paragraph which you read, what objection, if any, could be made to a simplification of the work in a shop so that the element of skill was reduced and more men of the kind who labor and work as you have suggested could perform tasks?

Mr. ALIFAS. There could be no objection raised to it, except it would be the objection that whenever the employer improves things, he keeps all the advantage of the improvement himself.

Mr. THOMPSON. That would be the objection?

Mr. ALIFAS. That would be the objection. We have no objection to simplifying things. In fact, if we could make everything by automatic machinery, and nobody would have to do anything, it would be perfectly satisfactory, provided the man who invented that did not keep all the advantage himself and let the rest of the world starve to death.

Now, paragraph 247 illustrates the effort which will be made toward cheaper workmen. The several possibilities of functional performance, however, will not have been realized until almost all the machines in the shop are run by men who are of smaller caliber and attainments, and are therefore cheaper than those that were required under the old systems. The adoption of standard ideas, plans, and methods throughout the shop, the planning done in the planning room, and detailed instructions sent them from this department; added to the direct help received from the four executive bosses, permit the use of comparatively cheap men even on complicated work.

Now, he will not be able to do that. It appears in certain shops that they have not reached this highly desired state of affairs where they can get along without the high-priced man, but that is due to their inability to make the system do what they thought it would; but it does not prevent them from taking advantage of the situation which will enable them to do that.

In regard to the speed, I believe that has been read here to the commission, paragraph 125, which relates to the pig-iron handlers at Midvale:

"When the writer left the steelworks, the Bethlehem steelworkers were the finest body of picked workers that the writer had ever seen, altogether. They were all practically first-class men; the work they were called upon to do was such that only first-class men could do it; the tasks were purposely made so severe that only 1 out of 5, or perhaps even a smaller percentage than this, could keep up."

Now, with regard to that, as I remember it, there were about 400 men in that gang and only about 140 or 144 of them were finally retained. If labor conditions had been very bad in that district from the workers' point of view they naturally would have attained very high speed. Mr. Taylor the other day illustrated what he meant by first-class men, by comparing them to horses—not comparing the workmen to horses, but in the sense that he would take a large horse to do heavy work.

In introducing scientific management I do not suppose that the man who hired them would hire a weakling to carry pig iron, but in the first place he would naturally select men who he thought would be capable of doing it, and men would offer themselves for that service who thought they would be able to perform the duties. Now, after trying such men as that, who ordinarily would appear to be capable of doing it, only about 1 out of 5 were able to do the work assigned to them. The others would either quit or go to other work, or they would be discharged for their inability to do the work.

Now, that looks pretty severe to us. I think one reason why the employees who were contemplating the work under this system in the Government service,

one reason why they were fearful of the system, was due to the inability of those over them to see anything drastic about that book. Even after pointing out these things to them it seemed like they were unable to see that that would cause anybody any hardship.

Now, we have a pretty fair conception of what we consider hardships, and if those are not hardships we do not know what hardships are.

Mr. THOMPSON. What, if any, increase in pay do you know that these men got—do you?

Mr. ALIFAS. Yes.

Mr. THOMPSON. What is the additional output, if you know?

Mr. ALIFAS. I think it is shown in the book that instead of carrying about 13 tons of pig iron a day they carried about 48 tons of pig iron a day, and instead of receiving \$1.15 for that they got \$1.85. It was stated, I believe, that some men would work in their gardens in the evening under the old way of working. However, there is some question as to whether, after a day's work carrying 48 tons of pig iron, they would be able to do that or not.

Now, another limitation—

Mr. THOMPSON. In that particular case they carried about 300 per cent more?

Mr. ALIFAS. Yes.

Mr. THOMPSON. Three hundred per cent more pig iron and got a little over 50 per cent more wages?

Mr. ALIFAS. Yes; something like that.

Commissioner WEINSTOCK. How do you make it 300 per cent increase from 12 to 48?

Mr. THOMPSON. From 12½ to 48.

Mr. ALIFAS. From 12½ to 48. That would be about 3 to 1.

Now, another limitation that I wish to call the attention of this commission to is the question of what a man is able to do. It appears that these gentlemen have figured out to a nicety just how long rest periods men must have during the day in order to be able to carry a certain load. That is, if he rests less, he carries less; and if he rests more, he also carries more. That is, by experimenting they have discovered just exactly how much a man can do. That resolves itself down to a very pertinent suspicion that if they had their way about it they might start to find out how much it was necessary for a man to eat in order to maintain his strength, regardless of whether his appetite was satisfied or not, and then base his wages on what it was necessary for him to earn in order to sustain life. That is a bare possibility; at least, it falls in line with scientific methods of doing things.

Mr. THOMPSON. Are they not really doing that now?

Commissioner WEINSTOCK. That is done under the minimum wage law to determine the cost of living.

Mr. ALIFAS. Yes; they determine how much it costs to sustain life.

Commissioner WEINSTOCK. The State does that?

Mr. ALIFAS. Yes; how much it costs to sustain life, and they determine that you must at least get that.

Mr. THOMPSON. That is, so many calories of strength.

Mr. ALIFAS. Yes. Now, we object to being reduced to a scientific formula, and we do not want to have the world run on that kind of basis at all. We would a good deal rather have the world run on the basis that everybody should enjoy some of the things in it, and if the people of the United States do not want to spend all their time working they have a right to say so, even though the scientific engineers claim that they can do five times as much as they are doing now. If they don't want to do it, why should they be compelled to do it?

Mr. THOMPSON. Just one point: Assuming by the introduction of scientific management in regard to these men they reduce the efforts of the men, cut out waste motions and false motions, and teach the men to do the work easier and thereby to accomplish more work in a given number of hours, your objection just made would not apply to that condition, would it?

Mr. ALIFAS. No, sir; it would not.

Mr. THOMPSON. So far as it did that, you would agree to that system?

Mr. ALIFAS. I would agree to anything that cut out unnecessary work on the part of the people, provided of course that we were not put to too great an inconvenience. That is, I would not care to burn down this entire city with the assurance that I would have a better one 50 years from now, because we might have to live in a tent in the meantime. But improvements are a good thing, if you do not have to suffer too much inconvenience in getting them.

Of course the man who is starting these improvements can stand to see the workmen suffer considerable inconvenience in order that he might get the benefit of it.

Mr. THOMPSON. Forgetting for the moment the language of Mr. Taylor, which perhaps is very unfortunate in that book and perhaps elsewhere, and simply taking this fact into consideration, that by advising these men how to carry pig iron they are able to increase the man's output from 12½ tons to 48 tons a day, and without any more exertion on his part, could there be any objection to it?

Mr. ALIFAS. No; I do not think so except, as I have already stated, that the people who are inconvenienced by improvements should get sufficient benefits out of them, otherwise the improvement should be postponed until some solution is found by which they can get the benefit distributed.

Mr. THOMPSON. In other words, you would not have any objection to the saving of the waste motion and waste time, but if there is a saving you think the workmen should share more proportionately in it?

Mr. ALIFAS. Yes.

Mr. THOMPSON. Now, taking up your time-watch study, you said that you and labor objected to scientific management on that account. What have you to say in that regard?

Mr. ALIFAS. Yes. In the first place, I think that it is humiliating to have a man hold a stop watch on us. We have been, through the papers on scientific management, accused of "soldiering" repeatedly, and while of course we are not really blamed for it, the manufacturer is blamed for it because he does not take the necessary measures to prevent us from "soldiering"; that, however, is a blame that would be taken in very good part by him; but it is humiliating to have a man stand over you with a stop watch when it is well recognized that the reason he is doing it is because he suspects that if he does not do it, and tries to get your task as a whole, you would cheat him. That is, you would give him to understand that it took you longer to do the work than it did actually take.

I read an account not long ago of where a man had been in some foreign country, and one of the spectacles that amazed him very much was to see a farmer out in his field plowing, and he had his wife hitched up to the plow in connection with an ox. Now, even under scientific management, if that task had been fixed so that it was not hurting her any and that she was not overworked, yet I imagine that our American wives would feel somewhat humiliated at being in such a situation, so that, even though it does not hurt you any, it is possible to have a thing humiliate you.

Mr. THOMPSON. And you think the average American wife would object to that yoking?

Mr. ALIFAS. I think so. Another reason why we have objected to time study has been on account of the attitude of the employer to get the very most out of us that it is possible, and oftentimes the only defense that the workingman has had has been in the ignorance of the employer as to exactly how much he could do. Just as soon as an employer found out how much he could do, the employer would insist that he should do a larger day's work than it was possible for him to do and keep up, and the only defense he has had has been the same defense that a great many business houses and big corporations have when the public proposes to find out what their earnings are, to see if they can not get an increase in rates, or something like that—like our railways are doing—to endeavor to force the facts and figures with a view to pretending that they are not earning as much as they are really.

There seems to be a disposition on the part of people, when determining what anybody else should have, that they make it a little bit less than it ought to be. That is one reason.

Mr. THOMPSON. What cases do you know of in scientific management where that has actually been the case?

Mr. ALIFAS. Well, according to the testimony of the gentlemen here, it seems that piecework, when first established, is susceptible of being cut several times until it finally reaches a point where it is impossible to reduce it any more; but with the stop-watch practice, that last time after the job has been cut is the time that has been discovered in the first place, so that labor does not get the advantage of having had an easier time while the cutting was going on. Then they find out the least possible time they should take in the first place.

Mr. THOMPSON. Assuming, Mr. Alifas, that the time study is a normal time study, would there be any objection to making that time the task time?

Mr. ALIFAS. Well, in assuming that, you would have to assume that the people who have the final determining of it are going to determine right, and that is just where we differ.

Mr. THOMPSON. Assuming that they did determine right; what objection could there be to it?

Mr. ALIFAS. Assuming that they gave you the right task? I do not know as you could find any objection to it, if you assume that, but under the present circumstances I do not see that any assumption of that kind could be made, due to the fact that it is all determined at the present time by the employer.

Mr. THOMPSON. For instance, if a study of a task which took several hours—say five hours—involved quite a few different processes, it might be necessary to make a study of those processes to see wherein motions could be eliminated, and waste effort, and finally, on reaching the completion of the whole task, they would say that a certain time was normal. Suppose it was the right time and nobody could reasonably object to it, could anybody reasonably object then to the methods of examining into any of the processes to arrive at the same total, say five hours?

Mr. ALIFAS. That has something to do with the mental attitude that would induce a man to think that he should make a time study.

Mr. THOMPSON. Let us assume that it was understood on both sides that the desire was simply to arrive at the whole task, or process, and that it took five hours and required several processes; that it was simply a desire to arrive at a normal time for the whole task. Could there be any reasonable objection then?

Mr. ALIFAS. Well, there is no objection where there is no objection, of course; we all know that.

Mr. THOMPSON. Could there be any objection in that kind of case, where it was understood?

Mr. ALIFAS. Well, the objection is this, that when a man thinks it is necessary for him to find out what a workman is doing every minute of the day he has got an attitude of mind that is going to be hard to please as to the work to be done, and when a man takes that attitude it is necessary for the workman to guard himself. I think it is like a husband starting out from the house in the morning and he would decide to dole out, for his wife to use that day, so much pepper and so much salt and so many potatoes, etc.; whereas before she had been able to use about what she thought was necessary she would begin to think he was getting altogether too closefisted in his management, and that is what we think when the employer begins to inquire what he did with that last 15 seconds; it is time to oppose it.

Mr. THOMPSON. Are you a married man?

Mr. ALIFAS. Yes; and I don't do that.

Commissioner O'CONNELL. The scientific management is on the other end.

Mr. THOMPSON. I do not think that illustration, while very interesting, meets the idea I have. What I want to bring out, what I want to prove is, that if the employer and employee meet for the purpose of ascertaining in a perfectly friendly way as to what time should be consumed in an operation—where the employee understands that there is no desire to question his good will even much less his honesty—this thing would evaporate the thing you speak of?

Mr. ALIFAS. I would say, assuming the very favorable premises you have stated, that there could be no objection.

Mr. THOMPSON. Is it not a fact that in piece-price factories the determination of the piece prices, like in clothing factories and glove factories and other places, there is a time test made, not only at the instance of the employer, but often, and most often, at the instance of the employee, particularly in all these establishments where the manufacturer sets the price first, then the employee demands a time test of the operation, so that he may prove to the employer that the price he has set for the operation is not fair. In that case the employee insisting upon the time study could not object to it, could he?

Mr. ALIFAS. No; he could not.

Mr. THOMPSON. Then, therefore, the objection of the employee to the time study is to what he thinks is back of it; he thinks there is some question of his honesty or faithfulness of work, and he objects to it?

Mr. ALIFAS. Allow me to make an explanation there. The employee might ask that a certain thing be done, which he really objects to in itself; that is, that it is better than something else. I have heard of people who asked to be

allowed to go to the penitentiary instead of being hung, but that is not to say that he prefers the penitentiary instead of being free. A man might prefer a time study to an unjust condition imposed upon him by an employer, but that is not to say that he would be in favor of that time study.

Mr. THOMPSON. Then, you think, if I understand you correctly, that where an employer sets a price on an operation and the employee asks for a time study, it is similar to a man who is condemned to be hung asking for a term in the penitentiary?

Mr. ALIFAS. In the sense that it is a lighter punishment, so to speak.

Commissioner GARRETSON. It is the lesser of two evils?

Mr. ALIFAS. It is the lesser of two evils. That is what we object to—piece-work.

Mr. THOMPSON. Would you say that is the attitude of the employees in connection with time studies in different trades—the clothing trade, for instance?

Mr. ALIFAS. I would not presume to speak for the clothing trades. I am speaking for the machinists' trade, which trade objects to piecework, and to the necessary paraphernalia for carrying the piecework system into operation.

Mr. THOMPSON. If I should tell you that in the clothing trade the employees ask for that time study and accept it as part of their machinery for arriving at prices and it is not looked upon with any disfavor whatever that would eliminate at least one group of workers, would it not?

Mr. ALIFAS. Yes, sir; assuming your premises, it would.

Mr. THOMPSON. But as a result of your testimony, it is what is back of the time study that you object to?

Mr. ALIFAS. That is it.

Mr. THOMPSON. The motive?

Mr. ALIFAS. That is it—the motive.

Mr. THOMPSON. The implication?

Mr. ALIFAS. The motive behind it; and that brings out another point I would like to just touch on before I forget it. That is the suggestion that has been made here that employers should confide in employees what they propose to do. In accordance with this system I see that it would be very much to the disadvantage of the employer to confide any such thing to the employee if he proposes to do to him what these writings indicate. He would in effect tell a good machinist that is working in the shop, getting \$4 a day, "I want to time you on this job, and I want to find out if you can do two or three times as much work as you are doing now, and then I propose to make you do it. That is, I am going to pay you enough so you will not quit here and go somewhere else, but I am going to make you do it by penalties, if I can not find somebody else that is cheaper than you are who can do that, and if I can I will take him." That is in effect what he would have to tell the employee if he proposed to follow out this system as we understand it.

Mr. THOMPSON. Then, in your opinion, under the ordinary rules of business, the scientific system of management, while designed to lessen effort and eliminate waste, is really a method by which the employer can exploit labor?

Mr. ALIFAS. That is the idea exactly. Simply because a thing is scientific does not make it good; that is, you may discover a scientific way of doing almost anything, such, for instance, as swindling the public. They have that down to a science, I understand, in New York and certain places, where they inveigle the credulous into certain schemes and then trim them. They might reduce that to scientific methods of doing it, and yet it would not be a good thing simply because it was scientific. It depends on the purpose for which you expect to use any given knowledge whether it is good or not.

Mr. THOMPSON. If the introduction of a scientific system of management was simply for the purpose of eliminating waste, false motions, and the like, and labor was to share fairly and fully in the saving thereby, there could be no objection reasonably to such a system, could there?

Mr. ALIFAS. No.

Mr. THOMPSON. If the chairman please, that is all.

The ACTING CHAIRMAN. Mr. O'Connell?

Commissioner O'CONNELL. Nothing at this time, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Garretson?

Commissioner GARRETSON. Mr. Alifas, do you and the average man whom you represent believe man was created wholly for the purpose of creating wealth for others?

Mr. ALIFAS. No, sir. Man was created, we think, for the purpose of enjoying life to some extent.

Commissioner GARRETSON. As you understand scientific management from the presentation from which you read, it would act as an amendment to the ordinary catechism which gives man another purpose in life?

Mr. ALIFAS. It would seem like it.

Commissioner GARRETSON. Does the perusal of the writings on the subject with which you are conversant convey the idea to the average laboring man that this form of management is a boon to labor, an unquestioned good?

Mr. ALIFAS. I have endeavored to find that out first hand. About three years ago I went to Philadelphia for the purpose of interviewing some of the employees who were working in three plants of that city, where it was alleged they had introduced scientific management. Those plants were the Midvale steel plant, the Link Belt Co., and the Tabor Manufacturing Co. I interviewed the employees that were working there or that had worked there that I could find and that I could see. I only found one man who liked the system, who would not rather work under the ordinary daywork at the regular daywork wages.

Commissioner GARRETSON. He did not like the real thing any better than he liked the public statement, then, in regard to what to do?

Mr. ALIFAS. Apparently not.

Commissioner GARRETSON. In regard to the rules that exist in trade agreements, is it not true that a large number of those rules, covering both wage or condition of service, are not a fair example of what either side, employer or employee, in making up the trade agreement desires, but are compromise measures?

Mr. ALIFAS. Yes, sir. The employee, as a rule, would make—I will state that this way, and come right to the point: Each side would make it more favorable to itself if it could.

Commissioner GARRETSON. It is the result of mutual concessions?

Mr. ALIFAS. Yes, sir.

Commissioner GARRETSON. Is not that true of every trade agreement with which you are familiar?

Mr. ALIFAS. Yes; it is.

Commissioner GARRETSON. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Weinstock?

Commissioner WEINSTOCK. Mr. Chairman, I regard Mr. Alifas as one of the most intelligent and one of the best informed men from the labor side on this question of scientific management.

Mr. ALIFAS. Thank you, Mr. Weinstock.

Commissioner WEINSTOCK. There are a number of questions, Mr. Chairman, in connection with scientific management, concerning which my mind is undetermined. I have not been able to get conclusive evidence to reach an opinion of my own that I can depend on. I want to take advantage of this opportunity of questioning Mr. Alifas, and therefore I will submit to him quite a number of questions, and I want to ask the indulgence of the commission to permit me to take not only my own time but to take advantage of the absence of my fellow employer representative on the board, Mr. Ballard, and use his time also.

The ACTING CHAIRMAN. You may have my time, too.

Commissioner LENNON. And you may have my time, too.

Commissioner WEINSTOCK. Mr. Alifas, to begin, do you agree with me that the most valuable asset the State has is its men?

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. Do you also agree with me that the most valuable asset man has, the most valuable asset that you have, the most valuable asset that I have, is our efficiency?

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. Rob us of our efficiency, and we become burdens upon the State?

Mr. ALIFAS. In all directions, I would say. Our efficiency not only to produce something that somebody else helps to divide for us and give us our little share, but also our efficiency in getting more other things that we are already producing instead of trying to produce more and to get result from the Government we are under.

Commissioner WEINSTOCK. Therefore, really the most valuable asset the State has is the efficiency of its men and its women?

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. Anything that will increase that efficiency without injury is in the nature of a blessing, is it not?

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. Anything that will diminish that efficiency is in the nature of an evil?

Mr. ALIFAS. Yes, sir. I want to modify both of those answer to this extent, that anything that would increase efficiency without detriment to the individual is a blessing, and anything that would decrease efficiency for the benefit of the overworked individual would also be a blessing. I think there are some people who are working too hard at the present time.

Commissioner WEINSTOCK. I also think you will agree with me, Mr. Alifas, that all employers are not fair and not equitable and are not just. Do you?

Mr. ALIFAS. Yes; I do.

Commissioner WEINSTOCK. That there are employers who are unfair and unequitable and unjust?

Mr. ALIFAS. Yes.

Commissioner WEINSTOCK. And that it is the purpose of organized labor, as I stated, to protect themselves against that kind of employers?

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. Is that right?

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. In other words, if all employers were just and fair and equitable and did the square thing, there would be no need for labor unions, would there?

Mr. ALIFAS. No, sir. I will also add there that the good employer at the present time is handicapped in giving his employees poor conditions, due to the unjust competition of the unfair employer.

Commissioner WEINSTOCK. The unfair employer sets the pace?

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. And the fair employer must either follow that pace or get out of the game?

Mr. ALIFAS. That is correct.

Commissioner WEINSTOCK. I take it from that that you will also agree with me that all workers are not fair and just.

Mr. ALIFAS. Yes, sir.

Commissioner WEINSTOCK. That is, all workers do not give a fair day's work for a fair day's pay?

Mr. ALIFAS. I will modify that to the extent that as a rule a man is performing a task that is worth what he gets for it, because the employer would not hire him at all if he was not worth as much as he is getting; so he can not possibly cheat the employer by any means—that is, with reasonable supervision. The average employer would find out if he was not worth what he was getting. He might cheat the employer to a certain extent by not giving the employer a just return on his investment.

Commissioner WEINSTOCK. You do not think, then, it is possible for a man to do the least that he can and to hold his job without the employer dismissing him?

Mr. ALIFAS. Ordinarily I think that the employer would find out a man like that. I will state that our experience in daywork has led us to the conclusion that daywork furnishes a man sufficient incentive to make him do a good day's work. He may not invent new methods of doing it, but he does a good day's work with the implements he has at hand, and that the fear of discharge, the desire to stay in the same locality where he may own a home, and the natural fondness he might feel toward a good employer would induce him to turn out a good day's work.

Of course, these systems carry along with them, supposedly, a lot of new improvements that have been made, and wherever shops which they have invaded have been run in the old systems which have been in existence for 15 or 20 years, they have a lot of antiquated methods, and if they abolish those antiquated methods, together with their stimulus, that will increase the productivity, and all that productivity is charged to the system; whereas under the old method of doing work they could have secured perhaps three-fourths of that increase without putting any added stimulus on the workman.

Commissioner WEINSTOCK. If you were earning, for example, say, \$4 a day, would you be content to remain at \$4 a day for the rest of your days, or would you want to increase the amount of your earnings, if you could legitimately and honorably do so, without injury to yourself?

Mr. ALIFAS. Oh, every man wants to increase his earnings.

Commissioner WEINSTOCK. If I was to come to you—if you were my worker and I was your employer—and I should say, “Mr. Alifas, you are getting \$4 a day, and that is all you are worth with your present output; that is the maximum. If the output can not be increased you have reached your highest point. Now, I want to see if there is not some way by which you can earn more than \$4 a day, and I can also increase my profits. I am not coming to you as a philanthropist, and I am not coming to you out of benevolence. I am coming to you for our mutual good, and I want to see if I can not, for your good and mine, increase your efficiency so that you can earn more money and I may earn more money. I will exercise my brain, or such brains as I can hire, and cooperate with you for our common benefit.” Suppose I should come to you and say that; would you object to that?

Mr. ALIFAS. I would not object to it if I had some voice in the thing.

Commissioner WEINSTOCK. If you had a voice?

Mr. ALIFAS. And you should not insist upon getting all the benefits of it, and eliminating me, possibly.

Commissioner WEINSTOCK. Exactly. Now, if I should come to you and invite your cooperation and give you an equal voice with myself, you would look upon it as an advantage?

Mr. ALIFAS. Yes; without a doubt.

Commissioner WEINSTOCK. Your objection—and when I say “your objection” I assume that you are here representing organized labor, and are not speaking only for yourself—

Mr. ALIFAS. I have talked with a great many employees, and while they may not have expressed their objections in the same terms as I have, I feel that their objections are, either consciously or unconsciously, mine.

Commissioner WEINSTOCK. Then I take it that the objection to this so-called scientific management is not the fact that it can increase productivity, but the fact that it is put upon the worker without his cooperation and without giving him a voice in the matter?

Mr. ALIFAS. Yes. It is the purpose for which they propose to use it.

Commissioner WEINSTOCK. If that objection was removed—

Mr. ALIFAS. But I will say this, that the system has been built up with that in view. Now, it is a good deal like building a structure of any kind—you might say, building a guillotine. It is proposed to use that for the purpose of decapitating people, and you would not expect to have that used for a church organ, or something of that sort. [Laughter.] It is constructed that way.

Commissioner WEINSTOCK. Very well, then; you have not any objection to the system, then, I take it, but you have objection to the manner in which it is applied?

Mr. ALIFAS. I would arrange the system a little bit differently.

Commissioner WEINSTOCK. Go ahead and tell us just exactly how you would arrange it, so it would be fair and equitable to both sides.

Mr. ALIFAS. I will say this, that if we should agree to any one of the features of the system, it is so built up that the next logical step in the system is something else that we think is to our disadvantage. Of course we may be mistaken. Our opponents have credited us with a great deal of ignorance on this subject, but it looks to us, at least, as if it was built up in such a way that the next logical step would be something that would be finally to our disadvantage. I do not think we would have any objection to a shop or an industry, say, rearranging their machinery in such a way that there would be no unnecessary time lost in distributing the work, or properly routing the work. There would be no objection to that. There would not be any objection to ascertaining and insisting on it, in a general way, that workmen should use the proper speed and feed for work.

Now, I will say right here that the very elaborate explanation that Mr. Barth gave yesterday of his method of ascertaining the proper speed and feed could not be figured out by the workman as he figures it out, but the workman is accustomed to looking at a lathe, say, for instance, and he knows what kind of a tool he has got, and he can figure out by his experience—he knows it intuitively—about how fast that machine should run to keep that tool sharp until he gets to the end of the cut. If he has any number of pieces to make, he may experiment, and he does experiment. He will throw on a little heavier power and faster speed, until he gets the proper speed, and it does not take him much longer to ascertain that than it does for a man with an elaborate set of figures to sit down and figure it out. It might be likened to analyzing the air a man breathes. I take it that some scientist, if he was like efficiency

engineers, might wonder how people were able to breathe before they knew what the air was composed of. It is just like ascertaining what amount of speed and feed it is necessary to use at the point of contact with the steel, and in order to find out what it will stand, he will put on a little, and if it will not stand it, he will throw it down. We get that from experience.

Commissioner WEINSTOCK. Now, you heard Mr. Thompson explain to us the method that prevails in the clothing industry. He explained that the worker has an equal voice with the employer in determining the prices, and consequently in the clothing trade the men take the initiative and ask that the system be introduced. Therefore it is evident that in the clothing industry the objection that you have against the system has been removed.

Mr. ALIFAS. Yes.

Commissioner WEINSTOCK. That if the worker has an equal voice with the employer, and the employee is not supreme?

Mr. ALIFAS. No.

Commissioner WEINSTOCK. He is put upon a basis of absolute equality. It is a case of real copartnership between the employer and the employee, and it has worked out in such a degree to the interest of the worker that he now desires it. Therefore would not the whole problem be solved if we transplanted the conditions that now prevail in the clothing industry into all other industries?

Mr. ALIFAS. I will say that that depends upon the character of the work. The clothing industry is such that it lends itself to duplication. There is very little variation in it. But in a machine shop there is a great deal of variation. Mr. Taylor told you that in ascertaining the variation in the speed of the machine there were 12 variables?

Commissioner WEINSTOCK. Yes.

Mr. ALIFAS. One of those variables is the hardness of the metal, which varies a great deal; and it is impossible for you to know until you try the metal, oftentimes, what its hardness is. I presume he guesses at the hardness of the metal and then he figures out how much speed that will take—the way they weigh a hog in Kansas—they put a rock at one end of the beam and a hog on the other end, and then they guess at the weight of the rock. He guesses at the hardness of the steel, and then figures out how fast the machine should run. It is just as easy to guess at the speed in the first place, or to experiment.

But to come back to the clothing industry and other industries, the conditions in the machine shop are so variable that there are no two things alike, you might say—there are so many variables. There are 12 variables in the cutting machine, and that is only a part of the variations which are possible, and that causes so much dissatisfaction where a premium or a bonus or a piece system is used.

For instance, if a man has a certain job to do, and if he has got a certain amount of time to do it, he goes to the tool room to get his tools. Now, tools are used over and over again by different workmen, and they may be worn. They may not be 100 per cent efficient. The workman's time is likely not to be on the basis that everything will be fairly satisfactory, and he finds that he can not get a proper tool. He loses premiums while he is working with a poor tool, through no fault of his. Then he may be waiting for a crane, and he loses premiums through that process. The steel may be hard, and he loses premiums through that. We are told that if it is proven to the management that there are any obstacles that they had not foreseen, they will be adjusted; but I believe it was Mr. Townsend who wrote an article to the American Magazine—I may be wrong about that, but I am pretty sure that it was Mr. Townsend—in which he said this: He said that if you gave men allowances every time they came around and apparently proved that they had troubles, you would never get a job, and that he had to shut down on the allowances altogether in order to compel men to overcome obstacles that he thought they ought to overcome by themselves.

In the machine shop the conditions are so variable that we feel that the workman should not be compelled to stand all the variations. It is just like an insurance company. People may insure—they insure their houses—

Commissioner WEINSTOCK. I have caught your point. It is not necessary to give that illustration.

Mr. ALIFAS. I just wanted to illustrate it.

Commissioner WEINSTOCK. I want to digress for a moment and put Mr. William O. Thompson on the witness stand for a moment or two.

Mr. Thompson, I take it that you are more or less familiar with the conditions that prevail in the woman's-garment industry?

Mr. THOMPSON. I am less familiar with it; but in New York, for instance, repetition is not the rule.

Commissioner WEINSTOCK. How many changes in prices are there in the clothing industry in New York?

Mr. THOMPSON. One firm had 6,800 different styles in a year. That would make 6,800 different prices in a year.

Commissioner WEINSTOCK. That was in one firm?

Mr. THOMPSON. Yes; and there are 1,000 firms.

Commissioner WEINSTOCK. All right. Does the same condition prevail in the woman's-garment industry that prevails in the men's-clothing industry—of both sides having a voice in fixing the prices?

Mr. THOMPSON. They do it in the clothing industry under the protocol; both sides have a voice. But that is because of the complicated nature of the work. A standard has not been arrived at.

In the cloak, skirt, and waist industry, also, women's garments—that appears from the name—they have spent \$40,000, both the unions and the firms, in trying to arrive at some standard or yardstick by which to measure the values. That report has just been completed. I doubt very much that it is the final word in that trade, because I know that they have had great difficulty up to very lately in being sure that they are right, but they have at least got an approximation toward some standard which can be worked out.

Commissioner WEINSTOCK. In both those cases, both sides have an equal voice?

Mr. THOMPSON. Yes; in that case.

Commissioner WEINSTOCK. And the prices are adjudicated by general action?

Mr. THOMPSON. By general action.

Commissioner WEINSTOCK. Do you know of any machine shop where there would be 6,800 changes in a season, Mr. Alifas?

Mr. THOMPSON. I was speaking of a year.

Commissioner WEINSTOCK. That was in one firm, there were 6,800 variations?

Mr. THOMPSON. Yes.

Commissioner WEINSTOCK. How many firms are there?

Mr. THOMPSON. There are 1,000 firms.

Commissioner WEINSTOCK. Is that the average number in one firm?

Mr. THOMPSON. No, sir.

Commissioner WEINSTOCK. That is the maximum?

Mr. THOMPSON. That is the big pumpkin of the show.

Commissioner WEINSTOCK. Is the machine-shop business more variable than that?

Mr. ALIFAS. I have not figured out the variations. Among those there are several thousand pieces, of those styles, that do not vary among themselves.

Mr. THOMPSON. The great reason for that is that the women of the land, fortunately or unfortunately, demand something that no other woman has got.

Commissioner WEINSTOCK. They want exclusiveness?

Mr. THOMPSON. Yes; that is the great problem.

Commissioner GARRETSON. They even want that in regard to men; they want a man that nobody else has got.

Mr. THOMPSON. I am not so sure about that last.

Commissioner O'CONNELL. The question of a change goes to the extreme of whether a buttonhole is up and down or straight across.

Mr. ALIFAS. So far as sewing a seam is concerned, there is not very much difference in the thread or in the hardness of the material; so that you can figure out how long it will take to sew a seam of so many stitches, with a certain number of stitches to an inch. Most of that would reduce itself, then, to some such problem as that. In the machine shop you might take a piece like that, that size [indicating] and they might change the diameter and you could not tell how long it would take to run a cut across that, because you do not know how hard it is. If it was very hard, it would take longer.

Commissioner WEINSTOCK. But somebody has got to determine that, sooner or later?

Mr. ALIFAS. Our point is that you determine it after it is done. The workman is a mechanic, and he endeavors to do the best he can with it.

Commissioner WEINSTOCK. Very well. Let us ignore the method that is pursued in determining the value. The fact is that somebody under the system does determine the value?

Mr. ALIFAS. Yes.

Commissioner WEINSTOCK. All right. At that point do you not meet the situation by giving labor an equal voice with the employer when the moment of determination arrives?

Mr. ALIFAS. Yes.

Commissioner WEINSTOCK. So that there are doubtless difficulties and problems, just as Mr. Thompson has pointed out there are in the woman's garment industry; but they are being met, they are being solved; but it is a progressive science and will never be absolutely solved, because conditions are changing all the time.

Now, if it can be done in an industry so complex, so variable as is the woman's garment industry it certainly ought to be possible to do it in the machine industry, which I take it is far less complex. Therefore, summing up, I gather as the result of my questioning you that the solution of the problem lies in giving labor a joint voice with the employer in determining values.

Mr. ALIFAS. All those details can be determined by conference and agreement and arbitration, I think. There are some things we would not submit to arbitration, however.

Commissioner WEINSTOCK. Those are outside of this particular question. That makes it clear to me, Mr. Alifas, that labor, being given a voice with the employer, under those conditions anything that will develop the worker—and he will not permit himself to be developed unfairly, he will not permit himself to be exploited—

Mr. ALIFAS. No.

Commissioner WEINSTOCK (continuing). Anything under those conditions that develops the worker, increases efficiency, and increases his earning power is a very great blessing to the worker, to his employer, and to society.

Mr. ALIFAS. Yes.

Commissioner WEINSTOCK. I am through.

Mr. ALIFAS. I can say in that connection that there are certain things we would not arbitrate, because even if they were arbitrated and were settled by conference with the employer, at the moment they got them established and he could get along very nicely without us, he could terminate it.

We could not get away from it. That is, he would have his plans all laid, and he would perhaps engage in collective bargaining while he was establishing these relations, but when he got his plans worked out he could get along without it; and there are matters, such as the time study, which we think is one of them; and the premium system is another, which we feel that we could not afford to allow to be introduced under any conditions if we could prevent it.

Commissioner WEINSTOCK. Then, taking the Watertown situation as an illustration, I am, then, to understand this to be your attitude: You ask that labor be given an equal voice with capital in fixing the rates?

Mr. ALIFAS. In fixing the amount that is a proper day's work?

Commissioner WEINSTOCK. Yes. In other words, I gather now, from what you have said in the last few minutes, that you do not want to consider the Taylor system or the systems that correspond with the Taylor system under any circumstances, and yet you ask the Government to give you a voice in wage fixing. What do you propose to concede to the Government in consideration of their giving you a voice in the fixing of wages? You have no right to come into court and ask everything and give nothing. What do you propose to give in exchange for that? If an employee insists upon getting more wages than the employer is willing to give, he goes on a strike or he does other things that are equally bad.

Mr. ALIFAS. That is the alternative. If the employer does not see fit to do somewhere near what labor wants, those are the things he has to contend with, and in exchange for that on these particular things he ought to be willing to arbitrate the thing.

In regard to such things as the premium system, that is a very radical change in the method of paying the machinist compared with what he has been accustomed to doing for a good many years, and he believes that he has discovered in the task system, other than the day system, the stimulus might be too much, and he can not afford to bargain too much in regard to it any more than a man who is susceptible to alcohol could afford to compromise on the matter.

Commissioner WEINSTOCK. What you have stated in the last sentence has put me up in the air as to where we are at. I understood this, that the objection you had to the so-called Taylor system was the fact that it was arbitrary, that labor had no voice in determining the conditions or bonus or premium, or whatever it was, and that if the same conditions could be established that prevailed

in the clothing industry there would be no objections to it. Then you turn around and say, "I would not have it under any circumstances." I can not reconcile it.

Mr. ALIFAS. On that particular thing I believe you are assuming that we had ideal conditions, and on that basis could afford to compromise, but now here is some one thing that the laboring people do not want to do, and if they do not want to do a certain thing the people of the United States have a right to say that they do not want to do it, even if some people could prove to them that they would be financially ahead by it. In regard to such a matter how can you compromise on a matter that you do not want to do at all? There is no halfway measure between a day work system and the premium system. We do not want to operate on a basis of pay that is variable, like the premium system, because we think that the day work furnishes stimulus enough. If we do not want any more stimulus than that how are we going to compromise on it?

Commissioner WEINSTOCK. We are told by representatives on the other side that there are tens of thousands of workmen in the United States, union and nonunion, who are working under this system, and who do not have to do it if they do not want to, they can quit, and the proof that they are willing to do it is that they do not quit, the fact that they do it.

Mr. ALIFAS. The fact that they continue to do it is evidence that they do want to do it?

Commissioner WEINSTOCK. Surely.

Mr. ALIFAS. At the Watertown Arsenal they are working on the premium system, and a very large percentage of them are utterly opposed to it.

Commissioner WEINSTOCK. That is a mere matter of opinion; that is not a fact. It is demonstrated, because on the opposite side it is said that they are satisfied.

Mr. ALIFAS. Who says they are satisfied?

Commissioner WEINSTOCK. Gen. Crozier, who was here, made that statement, that he has had no complaint.

Mr. ALIFAS. Suppose I was working at the arsenal, and Gen. Crozier said that I was satisfied and I said I was not; who would you believe?

Commissioner WEINSTOCK. If you were working there I would take your word, of course.

Mr. ALIFAS. The employees down there are the ones that I have been talking to on this proposition, and I have understood from the employees who have gathered the information, and also judging by the large petition that was sent to Gen. Crozier, that they do not want the system, and they had a petition signed by 300 people that was sent to the chief of ordnance last September, asking him to abolish the system; they didn't want it. That, to me, is evidence that they do not want it, no matter what anybody else might say; somebody else is not authorized to speak for them; they can speak for themselves.

Commissioner WEINSTOCK. It is very evident, then, that there is a very pronounced conflict of opinion.

Mr. ALIFAS. I have asked at least half of them collectively at the Watertown Arsenal, just offhand at a meeting of this kind, in which I endeavored to get at their true sentiment on this, if they would rather give up the premium system as it existed there, and not get the premium, but go back to day work, and they said they would.

Commissioner WEINSTOCK. How many have you asked?

Mr. ALIFAS. At that particular time I asked about 75.

Commissioner WEINSTOCK. How many are employed there?

Mr. ALIFAS. Well, there might not have been over 60 at that meeting.

Commissioner WEINSTOCK. How many are employed there?

Mr. ALIFAS. There are, I think, about 130 machinists.

A VOICE. I would like to make a statement as an employee of the Watertown Arsenal.

The ACTING CHAIRMAN. I do not think we can have that. We will call you at some other time.

Mr. ALIFAS. I will say offhand 130 machinists.

Commissioner WEINSTOCK. And you say there were 60 present at the meeting?

Mr. ALIFAS. Yes.

Commissioner WEINSTOCK. Was their opinion unanimous?

Mr. ALIFAS. Yes; there was not a single man that would not rather give up the premium and go back to day work.

Commissioner O'CONNELL. You were at the Watertown Arsenal just recently, during the investigation?

Mr. ALIFAS. Yes.

Commissioner O'CONNELL. How recently?

Mr. ALIFAS. Last week.

Commissioner O'CONNELL. This talk you had with the men was as recent as last week?

Mr. ALIFAS. Yes. May I say another thing in regard to this yard stick that you spoke of some time ago? The idea, as I understood it, was that the customer had a right to demand that the persons he bought cloth of should use the yard stick to measure it off.

Commissioner WEINSTOCK. And not use his eye.

Mr. ALIFAS. And not use his eye. I do not think that is exactly applicable to this. This system would put that question in this way; that the customer, who was the employer, buying the labor from the laboring man, has a right to go to the laboring man and say, "Now, you propose to sell me 6 cents worth of cloth; now, I am going to investigate your books and see how much cloth you can sell for 6 cents, and then I will say that that is the amount I want." That is a little bit different. The employer proposes to see how much the employee is able to sell him, how much he is able to do. Now, we are not asking the employer to open up his books and tell us how much he is able to pay, and then proceed to make him pay that, and we do not want him to try to find out the very maximum that we are able to do and then try to make us do it; it is a fair bargain to say, "Such an amount of work for a day's work is all we want you to do, and if you are satisfied to accept that as a day's work for so much, it is a bargain." A man does not have to work at his top speed if he does not want to. If he wants to take life a little bit easier and make a little less money, that is his business.

The ACTING CHAIRMAN. I think that is all, Mr. Alifas. We are much obliged to you.

TESTIMONY OF HENRY LAWRENCE GANTT.

Mr. GANTT. I would like to have somebody pretty soon bring that blackboard up here, because I am going to want to make some diagrams.

Mr. THOMPSON. Will you please give your name and address?

Mr. GANTT. Henry Lawrence Gantt, Montclair, N. J.

Mr. THOMPSON. And your profession?

Mr. GANTT. Consulting engineer.

Mr. THOMPSON. In your work as consulting engineer have you had anything to do with scientific management?

Mr. GANTT. I have been introducing what is generally called scientific management for some years.

Mr. THOMPSON. Where have you introduced it, if you care to state?

Mr. GANTT. I have no objection to stating those places which are commonly known, but some of my clients wish not to be mentioned in this matter.

Mr. THOMPSON. State those who are commonly known.

Mr. GANTT. One that has been spoken of here, the Sales Bleacheries, and the Brighton Mills, both textile concerns.

Mr. THOMPSON. Are there any others you would care to name?

Mr. GANTT. I have done some little work for the Amoskeag Manufacturing Co.

Mr. THOMPSON. In what other lines of industry have you put in your system?

Mr. GANTT. I have been connected with shops of various kinds, but inasmuch as I have only been connected with one shop of that kind of industry I would be substantially giving away my clients' names if I should do so, but I am perfectly willing—there is one case I think I can state without difficulty—I have been doing some work for the Remington Typewriter Co. and some work for the Standard Oil Bearing Co., of Philadelphia.

Mr. THOMPSON. In the introduction of scientific management in the shops you generally divide it up into two parts, do you not; first, that which deals with the mechanical end of things like routing, new appliances, etc., and then that part which relates to the management of the men?

Mr. GANTT. Yes, absolutely.

Mr. THOMPSON. Mr. Thompson stated on the stand this morning that in regard to additional efficiency that is obtained in the shops, that about an equal percentage comes from each of those divisions; that is, it is about equal. Is that the idea?

Mr. GANTT. I should say that rather more than 50 per cent came from setting your house in order, which in my experience takes at least a year in any shop of any size, and oftentimes longer. I have a shop on hand now where we have been working at it a year and we have not nearly got things in anything like the shape where we could begin to do the kind of things we have been talking about at this meeting. I have never done any job exactly as I would like to do it. I have never gotten any problem solved to my entire satisfaction. I have gotten a great many things done, and some shops are running very well, but I do not feel that I could say that everything has been perfectly installed anywhere.

Mr. THOMPSON. Briefly, to what is that due?

Mr. GANTT. That is due usually to the fact that those in particular when they get a certain amount done are satisfied; they are satisfied they can do the rest. I might say—but perhaps I have answered your question.

Mr. THOMPSON. Then it is not on account of any opposition from labor that you are not permitted to install the system completely?

Mr. GANTT. I have never had any opposition whatever from the workman that was not immediately overcome as soon as he understood what we were doing. If you would like, I can go into that subject and explain, but that is with you.

Mr. THOMPSON. You may do that, Mr. Gantt.

Mr. GANTT. Before I undertake to do any work for any concern, I ask the people employing me or who contemplate employing me, to read this little book, *Work, Wages, and Profits*. I ask those people who have in mind employing me whether they are in accord with the idea expressed in that book of how to handle their workmen and what share the workmen shall have in what is being done. Unless they are willing to subscribe substantially to what I have written in this book I have always declined to do any work for them.

We then start there. One of the things said in this book is that when a task has been once set that task remains permanent unless the method of performing the work is radically changed.

Another thing is that we shall use no coercion with any workman to cause him to do as we ask, and that no discrimination shall be used toward a workman, provided he objects to doing what we have set out for him to do.

Therefore, when a problem has been studied and a task has been set, if the workman does not wish to perform that task he is free to refuse to do it. Do you wish any illustrations? I can give you names where that policy has been carried out, and the illustrations are in this book.

Mr. THOMPSON. Do you know what happens to him if he refuses to perform that task?

Mr. GANTT. Yes; I can give one illustration. In the Brighton Mills we started to put some task work on looms run by three men. Two of those men started. The third one said he did not want that. After trying the work for a day or two, we found that the conditions had not been sufficiently perfected or standardized, and preparations had not been sufficiently completed to enable us to supply those men with the proper material in the proper condition to do their work satisfactorily. They were unable to earn the bonus. They were then told that "We are not going to ask you to earn a bonus on this work until we can get these conditions right." It took about a week to do that and at the end of that time, when we started up again, the man who had declined at first asked to be allowed to do it.

You will find that on a chart opposite page 182 of this book to which I have referred. You will find three Greeks. The one at the top is the one that did not do it. His name is Papadimitre. But, to make a long story short, that man earned his bonus almost continuously after he once got started, and since that time he has become an instructor of weavers in that mill. The man is a Greek.

In explanation, for the enlightenment of those who are not familiar with these charts, I will say that we keep charts of this character for what people we have on task work. We make a black mark opposite the workman when he makes his bonus, and we make a red mark when he fails. We keep that kind of a record in every place we go, and we keep that kind of a record of all individuals. That record is open to inspection of the employees of that mill. It is used continuously. Whenever there is any dissatisfaction they are brought in and asked to look at this chart and see what the trouble is.

Perhaps I had better explain one of the things which will be necessary to understand if I am going to give you a clear idea of our form of paying bonuses.

The term "the bonus system" has been used. There are a great many bonus systems. The term "day work" has been used, which we all know about, except this; it has been assumed that day work was the panacea for everything. Apparently that is believed, as I have seen some of the worst bosses under day work that I have ever seen anywhere; but the probabilities are that everybody has seen them. No system is going to change human nature, and I do not believe a system of laws will change human nature. I have been able so far to ask, before I undertake the work, "Will you conform to the rules of the game we have laid down here?"

I would like to explain the way in which we pay a bonus, because there seems to be a great deal of misunderstanding on this general subject. In my testimony I wish to say that I have had very little experience with or knowledge of any work done by anybody except myself; so that my testimony is not of scientific management or efficiency systems in general. It is only of the work which I myself have done. I have been into almost none of the shops where other people have done work. If I mark off this horizontal line in equal distances on the blackboard and call each distance an hour, and represent that as the amount of pay for one hour, then the length of this line [indicating] represents the amount of pay for two hours, this [indicating] would be three hours, this [indicating] would be four hours, this [indicating] would be five hours, and this [indicating] would be six hours, the assumption being I have drawn my lines correctly. If a man is working on day work, he works one hour and gets that amount of pay; for two hours he gets that amount [indicating], and so on. Let us suppose we have studied the task—and I want to say, in order to save time, that I am substantially in accord with Mr. Thompson's description of the method of setting tasks or making time studies. I might add, though, that I have not any objection to having anybody present when we make all of the studies we are going to make. We do not ask anybody to perform a task unless we have entirely satisfied him that that task is an executable one. We do not discriminate against him if he refuses. We believe it is up to us to make the inducement to him such that he will do it willingly. You will find in this book the basis for that, at page 20:

"In considering the subject of management we must recognize the fact that in this country, so long as a man conforms to the laws of the State, he has a right to govern his own conduct and to act in such a manner as his interests seem to dictate. Granting this, it follows that any scheme of management to be permanently successful must be beneficial alike to employer and employee."

By beneficial, I do not mean only to give him more wages. He must consider it beneficial. I should decline to do any work where I could not convince the workman that it was to his interest to do it.

I will break off here for just a moment and say there have been a lot of questions about scientific management. There is one objection to the term, namely, that it is an implication that other things are not scientific. That point has been raised, and I think it is a good objection. But, all things considered, it seems to meet the case better than any other. However, I do not use it any more than I have to. I prefer for my work "modern organization."

There is one thing here which I have defined, "System of management":

"A system of management may be defined as a means of causing men to cooperate with each other for a common end. If this cooperation is maintained by force, the system is in a state of unstable equilibrium and will go to pieces if the strong hand is removed. Cooperation in which the bond is mutual interest in the success of work done by intelligent and honest methods, produces a state of equilibrium which is stable and which needs no outside support."

I am reading these things to you because they are things which I ask the people I work with to subscribe to before I start.

It takes anywhere from one year to two years before we can get to the point of making time studies or setting the tasks. We find all kinds of conditions that would hamper us if we started out at once. Usually the delay in work is that they have not got the material or have not got the tools or have not the means of getting proper information to the people at the right time. It takes quite a time to get a system of planning and routing, which enables them to give that information, and to get the information where the man wants it.

I want to say that if I go into a shop where there is piecework, one of the first things I do is to ask that the piecework be abolished and that a day rate

be established, such a day rate as is satisfactory to the workmen. If these people have been making an amount of money considerably in excess of what the ordinary day rate is in that community, the day rate is made satisfactory to them. It must be very close to what they have averaged on piecework. That is the only way in which we can do anything satisfactorily, because the day rate is the basis of everything. If there is no day rate established, and if it comes to a question of establishing the day rate, there is no objection whatever, in my way of thinking, to settling that by any means the management sees fit, in conjunction with the workmen—collective bargaining or any other way. It does not affect my work in the slightest, and I do not see any reason why there should be any difficulty in that matter. In this case suppose a man has work and has a day rate. In many cases I do not know what the day rates are. I much prefer not to know what the day rates are. But if a man has a day rate, which is represented by that mark [indicating] for one hour, and if he works two hours he will get that, three hours that [indicating], etc. If by the methods Mr. Thompson has described, we find that task is one which should be performed in five hours, and it has been decided the amount we are going to give him for that five hours' pay, the amount he gets if he does the work in four hours is five hours' pay. If he does it in less than four hours he gets five hours' pay. If he takes longer than four hours he takes his day rate. That is all there is in the bonus system which I operate. If a man does it in less than four hours, he gets that amount. If he does it in four hours, he gets that amount. If he does it in more than four hours, he gets the day rate.

There has been one factor in this which has not been brought out, namely, the idea of training the workman. We do not put green men in and expect them to do things without any training. We believe the man to study the job is the man that knows most about it. We like to get our study man from the shop. We like to have the best man there and to make him an instructor. He takes the men and trains them and teaches them how to reduce their time from six or seven or eight hours down to four hours. That we believe to be one of the best investments we can make.

When we have taught this workman how to perform the task in that time he goes out and does it. Let us suppose he fails to perform it at any time. That is immediately investigated. The cause of failure is immediately investigated. When a man turns in a time card showing that he has finished a job the clerk at once calculates whether he has made his bonus, whether he has done it in the task time or not. If he has failed to do it in task time that card is given to the foreman at once, and he must find out the cause of the loss and write it on the back of that card. We find that those causes are very much more apt to be the fault of the management than the workman. If the task has been fairly set, those things are very much more apt to be the fault of the management than the workman; that is, the management has failed in some respect; the material is not what it ought to be, the tools have not been kept in repair, or somebody has failed to do his duty. Then, we want a report on the back of that card as to what the foreman is going to do and what arrangement has been made to obviate that difficulty in the future. Those cards are summarized and then given to the superintendent. Every red mark on these charts, as we do the work, represents where somebody has failed to do the work as well as it ought to be done, and there must be an explanation of that go to the superintendent.

There are some other things that I want to bring out with respect to this. We have talked about planning and routing. If we have a properly balanced shop we have so many tools of one kind, so many tools of another kind, and so many tools of another kind, and we know that such a tool should get out so many pieces, and this tool so many pieces, and we want to balance those up so we will know each day what we are going to get.

After we have set the task, when the task is performed regularly, we get that man on a basis, and we can depend upon that man for the work he is doing; we can depend upon that number of pieces for the work in the next department—perhaps assembling our machines. It is therefore to our interest to get that amount of product, but it is not greatly to our interest to exceed it.

In setting tasks, I may say we always give the workman the benefit of the doubt. We expect him to make 10 or 15 per cent over and above his task; to do 10 or 15 per cent more than the amount called for by the task.

When you get to New York I think there will be some gentlemen there who would be glad to show you what they are doing in their work in these lines. I asked your chairman if he wished me to present any charts and so on with regard to that. He said there would not be time here, which I realized.

I want to show you one just for a moment; I want to show you a chart which I can not put in the record, because I am not at liberty to do it. You will be able to see it when you get elsewhere. These charts were actually kept. There is one with quite a little red on it [indicating]. There is one which has a good deal less. We have charts enough of this character to paper these walls here, in the different places.

The answer to one of the questions which has been troubling the commission seems to me to be this: If we can have publicity as to what is being done in this work we will answer a good many things. I do not know that that will solve all our trouble, but it will put us in the way of finding out the facts. Eight years ago that seemed to me to be a good thing, and I began to make these charts. If those charts are carried out, and they are made available through publicity, it will make it impossible for a concern to exploit its workmen to any very great extent.

Every red mark on there means that the workman failed to perform his task, and an investigation is made as to why he failed.

Now, we also ask them, at the direction or discretion of the superintendent, that a man shall be awarded his bonus even though he fail to perform his task. The troubles that have occurred in the changing over to scientific management are undoubtedly due to the fact that changing a system of management, where everybody has his own idea of his rights and privileges, is a very serious matter, and people have gone at it with that idea in mind, that they must have what they want, you know; there are people who think they must have what they want, and there are some other people who think they want the same thing, but they can not have it, in which case they can get a compromise, usually, if they go at it slowly enough. Perhaps I have given that part sufficiently in detail.

Mr. THOMPSON. With reference to your illustration, Mr. Gantt, in which you pay five-hour time for a four-hour task, what would be the objection, say in a case like that where two days' tasks were performed in an eight-hour day, to saying, "We will pay a daily wage." Let it be understood in the shop that it would be based upon the performance of two of those tasks. What objection would there be to that and not to establish any so-called bonus, as it were, but to allow 10 hours for 8 hours' work, the understanding being that two tasks should be performed?

Mr. GANTT. That is just exactly the idea I had reference to when I spoke of the abuses in the daywork system; they call it daywork, but it was a stunt system, which practically amounted to that.

Now, I do not know how you can prevent inconsistencies and things of that character cropping out anywhere except by publicity.

Mr. THOMPSON. I will ask you this: Is not the fact that you give a man an extra hour for completing a piece of work in four hours, is not the result of that apt to be the incurring or causing the worker to believe that he is being forced ahead by a bonus, and that there is something unusual and unnatural about the thing, that a piece of work can be normally performed in four hours, and he is to be given an hour extra for its being performed in that time?

Mr. GANTT. In most of the places where I have been the people have been willing and have been glad to get more money, if they could get it, and that question, as you suggested it here, has not arisen in my knowledge; but if the subject had been brought up and the speed had been set—now usually that job is done in 8 or 10 hours, without any instruction or teaching. Let me explain just for a moment. Most men who are familiar with shopwork of any kind know that there are some people in these shops who can do two or three times as much as the ordinary man in that shop. Now, the best use you can make of a man who can do that is not to make a pacemaker of him, but to make him an instructor, if you have simply daywork and nothing else, make that man an instructor to teach the other people how they can do it, you will get a great big improvement.

Now, if you set a task, and when you find out the reasonable amount to be done, you set a task and have this man act as instructor and pay the man who was doing it in eight or nine hours, and show him how to do it easily in four or five hours, he is glad to receive pay for the four or five hours, as a rule.

Mr. THOMPSON. In the minds of some people, is it not difficult to make them believe, as I have said before, that there is no trick about it, and that it is offering something to them by which they will speed themselves up to get more pay, because it is not in human nature to make people believe that an employer

is willing to give five hours' pay for four hours' work, but that there is something back of that?

Mr. GANTT. You know to give the employee enough to make him want to do it. Here is a general statement, I might say. A man hires himself out, and he is making \$2 a day, if you wish. He has been working as he saw fit, and willing to go along as he saw fit and make that \$2 a day. Now, he will obey instructions and work in any reasonable way that he is asked to work, provided a proper inducement is made to him to do it, and he will obey instructions, if he is accustomed to work on his own initiative, as a rule, when there is some inducement to have him do it. How much inducement do you have to give? That is the inducement [indicating blackboard].

Mr. THOMPSON. Turn it around for a moment. When you make a time study of a task and finally determine on four hours as being the proper time, your desire is to find out how much waste movement or other thing you can eliminate, and with that eliminated what time it should reasonably and fairly take to do the work.

Mr. GANTT. We do that before we set the task. We find out how much time it should reasonably take, and we do not set the task for four hours unless we find that four hours is a reasonable time, and ample time, to do the work.

Mr. THOMPSON. It is an attempt to set what would be a fair standard for that piece of work?

Mr. GANTT. Yes.

Mr. THOMPSON.—And by setting a fair standard for a piece of work, and let the workman be advised, and the employer as well, as to how much time one man should spend on that piece of work?

Mr. GANTT. Yes.

Mr. THOMPSON. That is the only thing that can be, is it not?

Mr. GANTT. Yes.

Mr. THOMPSON. And if that is fairly and conscientiously made and determined with some expertness, then it really represents an ideal time in which the job should be performed?

Mr. GANTT. Yes.

Mr. THOMPSON. Making all human allowances?

Mr. GANTT. Yes.

Mr. THOMPSON. If that is so, why could not a day rate then be made for the worker under which he shall be paid a certain standard wage per day, with the understanding that he is to perform during that time this particular task, that he should perform two of those tasks in a day, an eight-hour day.

Mr. GANTT. Oh, that is a perfectly legitimate thing to do, and I can see in many cases where it would work out very nicely.

Mr. THOMPSON. If there is in the minds of many workmen some idea that there is a trick in this bonus or premium proposition, and it seems an unnatural thing to them that a man should pay an extra hour when they did not perform the work, this day wage would eliminate at least that proposition, wouldn't it?

Mr. GANTT. Yes.

Mr. THOMPSON. And so far as what amount should be performed is concerned, it eliminates that, because you have already set your time study and your task?

Mr. GANTT. Yes.

Mr. THOMPSON. In your opinion any objection to the bonus or task could be eliminated by day work?

Mr. GANTT. I do not really know exactly what you mean, because that does not look like an objection to me.

Mr. THOMPSON. Well, if there is an objection on that ground, it would be eliminated?

Mr. GANTT. You would find it extremely difficult to carry that idea that you have there out; to adopt it as a general scheme. I think the theoretical idea—I will grant you—might be all right, but at the same time I should not like to operate a scheme of that general character.

Mr. THOMPSON. In many cases is not the task system set on the product of the day's work?

Mr. GANTT. It is usually set on the product of the day's work. My absolute principle is that if a man does in one day what is required of him, he gets paid for so many hours over and above the day.

Mr. THOMPSON. Why not, then, make a standard based on that, and say and have it understood "This is a task that a man must perform in order to earn that wage?"

Mr. GANTT. That would mix up the thing which I have tried to get out of. I have tried to leave the labor unions entirely free to handle their collective bargaining idea on the subject of the daily wage; not to get into the daily-wage question. I would much prefer to have that daily-wage question settled outside of my work entirely; therefore I would prefer only time.

Mr. THOMPSON. On that point, just to pin that down; when you have set this task of four hours, in reality the scientific part of your work is done?

Mr. GANTT. Oh, yes.

Mr. THOMPSON. The other is merely a matter of inducement?

Mr. GANTT. Yes.

Mr. THOMPSON. Really managerial inducement?

Mr. GANTT. Yes; managerial inducement. It is a question where you can bargain or where you can agree. I do not see any reason why that can not be settled by any reasonable agreement between people.

Mr. THOMPSON. In illustration of what I meant there I will give you this illustration: In a certain clothing shop where there are 800 cutters, the men are paid on a weekly wage basis, and these men vary, each man from the other in the shop, but it is understood as an element of return that the wage should be earned by the operator on the basis of the number of cuts he makes, and as a study of what that should be, a rate of 52½ cents has been set in that shop. If the cutter falls down for a couple of weeks in earning his weekly wage, by reason of not making a sufficient number of cuts, he is notified by the firm that his wages will be reduced at the end of the next week if there is still a falling off. If the falling off continues there is a cut. In the same way if he continually improves his output his weekly wage is increased.

Now, assuming that the price per cut has been nearly scientifically adjusted at 52½ cents, what objection can there be to that system in which the weekly wage is paid, and not a bonus or piecework or task?

Mr. GANTT. The weekly system, I do not see any objection to that, from the point of view of general considerations; the consideration which I find, though, is that it looks to me to be a very important one, namely, that the daily accounting is very much better for everybody. These men know to-morrow morning at 9 o'clock whether they have earned the bonus to-day or not.

Mr. THOMPSON. Let me just put a question to you there. The objection, if I understand it, which is made by labor, organized labor—which is perhaps the only labor that is qualified to speak, because the other people do what they are compelled to do in the shops—they take the job or leave it alone—but the objection is that it causes a man to speed up each day. Now, if a man should feel a little under the weather one day, he would feel that he could make that time up the next day; if he felt under the weather a couple of days, he could still make it up at the balance of the week; but here every day he is put to a test, and there is a specific and daily loss each day, and, as I understand it, under some of the systems, if he fails to cover a certain amount a day he makes quite a loss per day; it might amount even to a dollar by falling off in even a quarter of his task.

Now, does not this weekly wage give a better opportunity for a man to perform his work, provided the task has been set scientifically to the time it should take, or as to the money value of it?

Mr. GANTT. With regard to that I want to say that I have had a good deal of difficulty with some of my friends in getting them to allow me to pay the task by the day. So many people want to do it by the job. If the job only lasts two hours they want to say that he either earned or lost his bonus on that, but my experience so far is that the average for the day is very much fairer than in an attempt to do it at shorter intervals, do it by the day or week. I do not know just exactly what the effect would be, but the workman likes to know each day what he did yesterday.

Mr. THOMPSON. But assuming that the objection of the workingman was the fact that he was held down to each day in the latitude of time to cover shortcomings—

Mr. GANTT. I do not know that there would be any serious objection to that; I do not believe it would be as good a thing for the workingman in general, and I do not believe it would be as good a thing for everybody, because there is an element in that which I want to bring out, that if we ought to have so many pieces per day to assemble a certain machine, we have counted on so many pieces for that machine in order that we might assemble something out here, it is very important that we should have that many pieces per day.

Mr. THOMPSON. Is not that just the very reason why there is an objection?

Mr. GANTT. May be.

Mr. THOMPSON. Because there is a necessary speeding up of the man when he does not feel like it? That is to say, the task which he could do easily in four hours, the day before it might have been a little too much for him?

Mr. GANTT. Under those conditions, if that man should come in the morning and say, "I do not feel like working task work to-day, I am not feeling very well," he would always be relieved and given some other job under my scheme.

Mr. THOMPSON. But you know that very few men, even if they are in an independent position, like to confess an inability, even for a day, to do their job.

Mr. GANTT. You understand what I am trying to get at. I have tried in all the ways I know how to make this work, as near as possible, equitable between employer and employee. I do not feel that I would be making anything that would be permanent if I did anything which seemed to me to allow one to take advantage of the other. I will talk to you about that later if you wish me to, but you have brought up a question there that is an entirely new idea to me, and I have not given it any thought, and I do not know.

Mr. THOMPSON. I might say that we have had it worked out three years satisfactorily where 800 men were employed.

Mr. GANTT. It may be worked out; I will not say that it will not, but it is an entirely new thing to me, and my opinion would not be of any value, or worth a great deal.

Mr. THOMPSON. And they have tried to be equitable in their work, as to how much time it ought to take. The man devoted to that task alone is paid \$20,000 a year to see that the firm gets what is coming to it.

Mr. GANTT. I would like the job.

Mr. THOMPSON. Yes. Of course, he works pretty hard, though. Now, do you see any objection to the workingman who is asked to cooperate with a plan or proposition of the kind you mention taking part in the development of it?

Mr. GANTT. I do not see any objection to it. I will tell you in regard to that. Here is my experience: As I said before, putting the shops, whatever they may be, in shape for us to begin and make such set tasks is quite a long job. During that time the people engaged in this work of getting the shops in shape become acquainted with the workmen and with the foremen, and if they are not capable and honest people these workmen and these people find it out. I do not find any objection on the part of the workingmen if the man who comes out there to show them and set their work is really a capable and honest man. If he is not, he is going to make trouble, and I uphold the workmen in the trouble when they make it.

Now, usually of the people that I have got on the work, the workingmen seem to have more confidence in them than the management has. I find every now and then when something is done, and when my man makes a report, I find somebody from the head office comes and sneaks around to find out whether that report is true or not. I could give you—I am not at liberty to do so, but I could give you illustrations of where the workingmen absolutely are willing to do and believe what the men representing me have told them, far more so than the management—and I was hired by the management. I do not understand it, but that is a fact.

Mr. THOMPSON. Is there anything in the scheme of scientific management which would have of necessity eliminated the voice of the worker in the setting of the time standards and the tasks?

Mr. GANTT. Of course, what we have done is this: The task setter—Mr. Thompson gave you the specifications of the men who could make time studies and set tasks, and I am very much in accord with Mr. Thompson—the man who has not had an education which has fitted him to make a study of any kind on the job is apt to make a great many errors, and when he is shown these things and gets into it we do not have any difficulty with him at all. We do not make any study on any workman unless the workman is perfectly willing that we should do so, and I might say that it is my practice not to give a workman on any study any additional pay while we are making the study unless when the task is set we give that person the first show at the task.

Now, listen to that carefully, because that means a whole lot. A man or woman whom we study to set a task knows that when we take his or her time on that that we are going to give him or her the first privilege of making the task.

Mr. THOMPSON. What is the reason you do not give them extra pay?

Mr. GANTT. We do not give them—if we select them, then we go back and pay them a bonus for that time.

Mr. THOMPSON. Why don't you pay them the extra bonus or extra pay, rather, while they are being time studied?

Mr. GANTT. Wait a moment. Perhaps I made a mistake in what I said there. I said I did not advocate the method I spoke of, but I think it is done in some places.

Mr. THOMPSON. Why don't you advocate it?

Mr. GANTT. We do not want these people to speed up during that time. We want to get the facts. Mind you, I want to follow up Mr. Thompson's statement that scientific management is management by means of facts. Most management of every kind is management by means of opinion. Now, if we can differentiate between facts and opinions, we have got something, and we want to get the facts. It is facts that we are after, not to overspeed persons. We have had girls get very nervous when we studied them. They speeded away up. Well, we left them; we didn't want them to do it.

Mr. THOMPSON. Why wouldn't that objection you make to the operator speeding up while you are making the time study apply equally to when they are performing the work?

Mr. GANTT. We find this: That if I say too much to Tom Jones about working too hard, he don't like it. He says he guesses he knows how hard he can work. I have found that that usually settles itself, that they do not naturally take a pace which is killing unless there is some absolute reason for doing so; and later I can give you some data on the effect of it.

Mr. THOMPSON. Do you generally state to the person who is being studied, or to the shop in general, that it is done for the purpose of setting the task record?

Mr. GANTT. There is no question about their knowing that; they all know it.

Mr. THOMPSON. Is the work done in view of all the shop?

Mr. GANTT. In the view of everybody. We particularly object to getting off in some corner and doing it. We do it in the view of everybody, and with the person in front of the machine wherever possible.

Mr. THOMPSON. Then, you know of no reason why the worker should not have a voice in the determination of the time standard?

Mr. GANTT. We allow them a criticism in detail, and if there is any objection to it in any way we go over it part by part with them; and when we have done that we have never had any serious objection.

Mr. THOMPSON. What objection would there be to allowing the workers an equal voice?

Mr. GANTT. Just exactly what do you mean by that?

Mr. THOMPSON. I mean in case the representative of the workers disagreed with the employers, that they would then have to refer the matter for adjudication, or have to convince each other.

Mr. GANTT. I am not in favor of arbitration.

Mr. THOMPSON. Put it in this way, that in case the worker did not agree with the employer, it should be thoroughly understood that the employer could not put that task into operation.

Mr. GANTT. Unless the worker feels that it is a fair task, we do not ask him to perform it.

Mr. THOMPSON. What would you say about an agreement being made with the workers as a whole that unless their representatives agree it shall be referred?

Mr. GANTT. I have never considered that. I have never thought into it, but I have made that statement in this book, that we would use no coercion. It seems to me that covers it. It has covered it up to this time with me.

Mr. THOMPSON. In that event that would practically mean, when crystallized into the terms of an agreement, that the workers should have no agreement?

Mr. GANTT. Should have no agreement.

Mr. THOMPSON. Yes.

Mr. GANTT. It seems to me that covers it. It has covered it up to the present time.

Mr. THOMPSON. That is all I care to ask.

Mr. GANTT. Let me explain one other thing, if I may. The question has been raised about the quality of work. Now, we have discovered a very interesting thing about quality. If a man is comfortably busy, so that he has not time to stop and do other things, his work is better than if he has time to stop and think about something else; and that is especially the case with girls. If a

girl has enough work to keep her comfortably busy, so that she has to keep her mind on the work all the time, her work will be of a higher quality than if she has time to stop and think about something else, and talk about last night's party, and so on. Her work goes off, then. We find that same thing in weaving work and other work. A man running just enough looms to keep him comfortably busy, we find, is happier and does better work than a man who has not quite enough to keep him busy, and sits down and gets to dreaming about something—of course, I do not mean that he should never sit down—gets his mind on something else. Then he finds that he has got a whole lot of stuff in there to pick out. What we want is to give them enough work to keep them in a healthy condition of activity. In that way you get the best work. There is a point there that I hope to be able to give some light on some day, but I have not got it yet. There is the question of quantity and quality, where you get to a peak where those two things make a maximum.

The ACTING CHAIRMAN (Commissioner Delano). We will adjourn this meeting now, and will ask you to come back to-morrow morning if you will.

Mr. GANTT. That will be rather inconvenient for me. Do you think you will want me very long?

Commissioner LENNON. Mr. Thompson has asked all the questions he has to ask of Mr. Gantt.

The ACTING CHAIRMAN. Mr. Thompson has finished with the direct examination, but I supposed members of the commission would want to ask you other questions. Mr. Garretson, have you any questions to ask?

Commissioner GARRETSON. I have about two or three.

Commissioner WEINSTOCK. I have none.

Mr. GANTT. I am not quite through. I should like to read something here that will take me about five or ten minutes.

The ACTING CHAIRMAN. One reason why we must adjourn very soon is that we are required to give up this room at six o'clock. The hotel requires it. For that reason we would have to adjourn very soon, but if you have very little to say, we might have time for it.

Mr. GANTT. I have very little to say, but I would like to answer your questions.

Commissioner GARRETSON. You dwelt, time and again, on the fact that there is no coercion used.

Mr. GANTT. In my work.

Commissioner GARRETSON. Oh, sure; but what I want to know is: What happens to a man if he keep on refusing long enough?

Mr. GANTT. Now, we have not had that condition obtain at all. If the task is right, we have not had that. I do not know just exactly what might happen in the long run, but we have had this case where that did happen, and the local system superintendent undertook to fire a person, and the general manager ordered him taken back. He had not agreed to do the things according to this—

Commissioner GARRETSON. Did that man go on working at the old rate while everybody else had the new one?

Mr. GANTT. No; he—well, I really do not know. I have forgotten the details of it, and I would not like to say. I know that the thing went off all right.

Commissioner GARRETSON. I could not see how the old system would be continued for one man while a new system went into effect for all others.

Mr. GANTT. Excuse me—as to the day work, there is no place in which all the people are working under a task system. There is great deal of day work. In fact, in most of the factories where I have had anything to do we had a great deal of day work. There is day work available for a great many people.

Commissioner GARRETSON. Mr. Gantt, what is your standard of judgment of men under certain conditions? We will assume that we have a man who has given a pretty thorough study for, say, 15 or 20 years, to the problems involved in the industrial connections. Is your standard of honesty and intellect for him based on whether he agrees with you?

Mr. GANTT. I should not like to say that, Mr. Garretson.

Commissioner GARRETSON. I did not know.

Mr. GANTT. No. You know, I am only one of a great many people. I do not claim any supernatural powers, or anything like that. I am only one. I am a Democrat.

Commissioner GARRETSON. I am not.

Mr. GANTT. Well, I am. One of the things I was going to read was what my ideas were on some of these things, and I should like to read this. This is a part of a paper that I read a while ago. It will take only five minutes.

Commissioner GARRETSON. Let me ask you one fractional question more. You referred right there at the last to the fact that if you keep a man busy enough, he is happy, if you do not keep him too busy.

Mr. GANTT. Yes; you must not overwork a man.

Commissioner GARRETSON. Have you ever studied to know if you kept a man hungry enough, but not too hungry, it had any effect on his happiness or his productivity?

Mr. GANTT. No; I never considered that.

The ACTING CHAIRMAN. If you can not be here to-morrow morning, will you hand that paper in so that we will get the benefit of it?

Mr. GANTT. It is only a short paper. I was not going to read this whole paper. I will shut off now.

Commissioner LENNON. If you want to submit that, hand it in to us and we will make it a part of the record.

Mr. GANTT. All right.

The ACTING CHAIRMAN. We can not have the use of this room to-morrow morning for our meeting, but the hotel has kindly assigned for our use the lounge or parlor on the floor below, directly north of the office, and the hearings will be resumed there at 10 o'clock to-morrow morning.

(Whereupon, at 5.50 o'clock p. m., the commission adjourned until to-morrow, Thursday, April 16, 1914, at 10 o'clock a. m.)

WASHINGTON, D. C., *Thursday, April 16, 1914.*

The commission met at 10 o'clock a. m. in the Shoreham Hotel.

Present: Commissioners Frederic A. Delano (acting chairman), John R. Commons, Mrs. J. Borden Harriman, Harris Weinstock, S. Thruston Ballard, John B. Lennon, James O'Connell, and Austin B. Garretson.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. B. M. Manly, superintendent Division of Industrial Investigations; and Mr. F. H. Bird, superintendent Division of Public Agencies.

The ACTING CHAIRMAN (Commissioner Delano). Mr. Thompson, call your first witness.

Mr. THOMPSON. I will ask Mr. Duncan to take the stand.

TESTIMONY OF MR. JAMES DUNCAN.

Mr. THOMPSON. Mr. Duncan, will you please give your name and address?

Mr. DUNCAN. James Duncan, Hancock Building, Quincy, Mass.

Mr. THOMPSON. And your business?

Mr. DUNCAN. General president of the Granite Cutters' International Association of America; incidentally first vice president of the American Federation of Labor.

Mr. THOMPSON. How long have you occupied each of those positions?

Mr. DUNCAN. Since the fall of 1894 and the springtime of 1895.

Mr. THOMPSON. In a general way, what is the granite cutters' union; what does it include in its membership?

Mr. DUNCAN. It includes in its membership practically the men engaged in the trade. The trade is what we call practically well organized and comprehends all the men cutting granite and hard stone in North America, the men who polish it, the tool dressers for the cutters, and the men who saw granite and turn it by turning lathes; anything that produces a piece of dressed granite after it leaves the quarry until it is put to use, from the roughest kind of street work to the finest kind of statuary.

Mr. THOMPSON. Do you include in the membership the builders of structures—those who are engaged in the erection of buildings and the placing of granite?

Mr. DUNCAN. In some instances are members setters—that is, what are known as stone setters—but as a general proposition the stone is set by stonemasons who are not members of our association.

Mr. THOMPSON. Then it might be said that the majority of your membership is engaged in quarry work and shopwork on granite and other hard stone?

Mr. DUNCAN. In the cutting and dressing of granite after it is quarried.

Mr. THOMPSON. In what you might call shopwork?

Mr. DUNCAN. In sheds, as we call them.

Mr. THOMPSON. Have you had any experience with the so-called efficiency systems or methods of scientific management?

Mr. DUNCAN. Only by general knowledge. I am not aware that the subject, by the title you give it, has been specifically known or in evidence in our trade. Efficiency in our trade is at such a high tension itself that I suppose the efficiency managers did not feel that there was much opportunity for them to enter in.

Mr. THOMPSON. Have you made a study of the so-called efficiency systems and scientific management systems which are spoken of to-day?

Mr. DUNCAN. To some extent.

Mr. THOMPSON. From the study which you have made, what have you to say to this commission as to their benefit or lack of benefit to the workers?

Mr. DUNCAN. As I have stated, we have little evidence of it in the granite industry, because of what we call strong competition among men to hold jobs; because of the competition between contractors to get contracts in selecting the very best men they can select to manage their business; and the superintendent or foreman who would not practice what theoretically is called efficiency would not hold his occupation very long. Then the competition among the men behind the hammer to hold their jobs is such that it causes a large portion of the trade to study the nearest and most practical way to get done as quickly as possible. By doing so those who are most efficient in that direction have the best wages and the most steady employment.

In other lines I could not speak with the same authority as men employed in some of the other industries, but from such opportunities as I have had of gaining knowledge upon the subject I have not got much to testify in favor of so-called efficiency being of advantage to working men and women. There may be times when an efficiency manager, or any other outsider, might see something that could be done, in the same way as an onlooker may see a chance in a game of checkers, that the players, because of their intensity of interest in what is going on, may not see; but apart from that the men and women in the different occupations are so placed in our competitive system that in order to retain their positions they all need to be more or less efficiency managers in accordance with their opportunities and mental and physical capacities.

Mr. THOMPSON. In granite cutting there is a very strong competition, as you say, between man and man for the jobs, is there?

Mr. DUNCAN. Yes.

Mr. THOMPSON. And each one maintains his position by reason of his personal efficiency?

Mr. DUNCAN. Yes.

Mr. THOMPSON. Is it not possible that in the heat of this competition, in the desire to go ahead, the man must give a sort of catch-as-catch-can attempt at efficiency and have not the time for calm consideration as to the methods and means which, perhaps, if it was done, a still more efficient method might be adopted than the necessarily hurried attempts of an operator under pressure?

Mr. DUNCAN. That might be possible. In a general way I do not think it would apply. Workmen, of course, are human beings, and each of them has his own brain construction and his own way of doing things, and two men will reach one point pretty nearly at the same time in different ways. In granite cutting, for instance, sometimes a man with a slow blow, as we say in the trade, is the most efficient workman. He takes time to think, and every blow that he strikes produces a result, whereas a man who would be hitting faster would be wasting certain energy that the other man was conserving; and it is true that the man who practices what we call the slow blow is not only usually the most efficient workman, but he usually is among the fastest.

Mr. THOMPSON. To carry that analogy just a little bit further, you stated previously that the men work under competitive pressure.

Mr. DUNCAN. Yes.

Mr. THOMPSON. Now, take a practical student; not a theoretical man, but a practical student, who would calmly study your work for a year or two before he gave any directions. By reason of that slow-blow process, or careful weighing of the operation from point to point, is it not possible that he might be able to make a suggestion which would be of value to the workers in the doing of the work?

Mr. DUNCAN. Yes; it might be possible, but it is extremely remote. The man who would stand aside, who does not know the trade, who would make suggestions occasionally, the thing that he would suggest which would be apparently of immediate advantage would be very likely to be found of disadvan-

tage in another direction; and the man who is trained to the work and, in his competitive way, is doing his best with it, knows how to lay out and proceed with his work so as to produce the best results, which I do not think any scientific manager could foresee unless he was skilled in the industry.

I followed my trade many years in Baltimore, and personally I knew quite a number of the students in Johns Hopkins University, and they used to come and talk to me in their spare time and watch me at my work. I followed, wherever possible, the lightest kind of work—lettering, carving, and so forth—and some of the things that I did while I was talking to them, without apparently applying my brain, were so marvellous to them that they used to come back and look again, and bye-and-bye they began to make suggestions to me. I do not know if they were studying the rudiments of this scientific management or not. However, they advocated their opinions, and would say to me if I would do so-and-so could I not do it a little quicker. They did not say that I might do it better, because the grade of the work did not come natural to them. They did not know the grades of the work, nor, perhaps, other than being pleasing to the eye, could they tell when the work was finished according to the grade of work required.

Usually the suggestions they made to me were just such as any person would make to another person, being first introduced to something the bulk of which they did not know anything about—what I might term superficial statements.

Mr. THOMPSON. Take the case of an expert granite cutter, when he had shown particular skill in stone cutting and dressing, one who had a knack in intuitive capacity at his work, and remove him from this competitive strain which drives men on, and say to him, "Now, here, you seem to have a natural skill at this work; just take and study it; take a year or two years and study this proposition. You are a practical master of the trade; you are the best man we know, and we believe that something better can come from you than this very competitive work that you have done; we believe that you have in you the possible improvement of the trade. Study it thoroughly, carefully, with your practical knowledge, doing systematic work." Might it not be possible that such a man could add to the knowledge of the trade and be able to suggest improvements in the methods of work that would help not only increase the output, but which would save the workers?

Mr. DUNCAN. I scarcely think that would be the result. One thing that would happen would be to make him improve himself in knowledge as to how to do a thing, and do it a little better, but when he went away from the experimental stage, back to competing with the other men, the employer would consider time the criterion by which to judge him, and he would have some advantage by having had time to think without competition, and to perhaps form certain mental combinations by which he could do the work a little faster or better than the others.

Mr. THOMPSON. We will assume that, as a result of this study, he had devised a much better method of doing the work than that ordinarily in vogue, which followed along certain old lines.

Mr. DUNCAN. Yes.

Mr. THOMPSON. Then could there be any objection to putting into effect such improved methods, provided always that they were of an advantage and benefit to the worker?

Mr. DUNCAN. No. We are all of the time doing that, we are taking advantage of everything that comes from thought or practice or anything at all. In fact we have to do that. We can not help ourselves. If we do not we find ourselves out of employment.

Mr. THOMPSON. Then any opposition that might exist on the part of anybody, so far as you know, to any method of doing work, would be the opposition which exists in every man's heart to methods which are devised to drive him on to his utmost. Is not that true?

Mr. DUNCAN. To a very great extent that is true. When men are working with a will, which they must, in order to reflect themselves in their work, if some one comes to tell them to do it in some other way, or to suggest new methods to them, it is somewhat like teaching an old dog new tricks. They will in a second grasp the idea, if there is anything in it, but if there is not anything in it they consider their time is being wasted by a bore buzzing around them.

In regard to the question that you asked a few minutes ago about the man with the slow blow, and the advantages in its being taught to others, I would say that you should have in mind that a man who works with what we call a

swift blow works that way naturally, and to change him from his method of doing his work to a man with a slow blow you would have to remodel the man. He is following something in his nature, in his mental and physical make-up. It seems to him to require that he hit fast, and make out in that way; and because of that being his trend, his mentality, at least, would have to be remodeled, and I am not sure but also his physical body. Efficiency managers claim a great deal, but I question if they, in a long time, could do that.

Mr. THOMPSON. My idea of that illustration was simply to show that as in your opinion apparently the slow-blow man was the man who did the best—

Mr. DUNCAN. Usually, not always. Sometimes they are naturally slow all of the way through, but usually it is a fact that the man with a slow, careful blow is the best, for every blow he strikes indicates upon his work, and there is nothing lost in the way of energy.

Mr. THOMPSON. I merely used that as an illustration. If that is so usually in regard to the slow-blow man, might it not be so with reference to picking out a method, and where the workers generally are under the compulsion of this competitive system, they have not got the time to really study what is the best way for them to do the work. That was the purpose of the suggestion, not to say they should teach a naturally fast man to make a slow blow.

I would understand from your last statement that if such a man, a practical expert stonemason, should study the profession and really make some improvement for the benefit of the workers, there could be no reasonable objection to it.

Mr. DUNCAN. No.

Mr. THOMPSON. Assuming that in the making of these studies he found that it was advisable, in fact, necessary, to make time studies of the men, and suppose the men understood that it was not for the purpose of questioning their faithfulness about their work, but was made by one of their own people for the purpose of trying to find a higher method of doing the work, what reasonable objection could there be to a time-study proposition?

Mr. DUNCAN. None at all. Everything that will be of advantage from any source has always been accepted. The best answer perhaps that I could give to your question is that to be taken from a recent actual experience. The members of my trade since the spring of 1900 have been working eight hours per day. We now have a 44-hour work week, namely, a Saturday half holiday. That has been in use in our trade all over North America since 1900. About a third of our membership had an eight-hour workday prior to that time. About two years ago an employer who had been in the granite industry for many years—he and his father had their place of business in Buffalo, and the business had been established for 60 years, and the present man had been in the business for over 30 years, succeeding his father—this man suggested that the men in the granite yard were doing so well under an eight-hour system, as compared to when they were working 10 and 9 hours a day, that he was of opinion that the limit had not been reached. He made an offer that he would pay eight hours' wages for a seven-hour workday, for a man to follow practically the process to which you refer, that is to say, not to be required to work any harder than his gait while working eight hours per day, but if his arms got tired, or if his eyes were blurred, or something of that kind, to rest a moment and look at his work and see what could be done, and give his eyes a rest, and so on, and then start again and see what the result would be.

He suggested that rather than have the appearance of having a worked out plan of his own, that the workmen in the shop should select one from their number to make the experiment. They selected one and he went to work and worked seven hours per day in a shed where others were working eight hours, and he did not, as far as he testifies himself, and the others the same thing, work any harder than he had been doing before, but he worked a little more steadily and took a little time occasionally to think out the best way to do certain things, and after the limit of time had expired—I forget whether it was one month or two months—it was found that the man was producing a fraction more in the seven-hour workday by that method than he had been doing in the eight-hour time, and it seemed to carry out the idea that the employer had, and also the idea that many of us have. You know we are still expecting that by and by as our economics develop, we shall get down to a six-hour workday, three hours before noon and three hours after 1 o'clock, for a full day's work, in order to give men time to think and study, for leisure, and to become more humanized than the brutality of the past which has followed all of the hard trades, that wreck a man in his physical condition before he is 45 years of age. We need something of that kind, because at the

present time, when the men in our trade begin to show gray hairs, they are not so much wanted, and if any other plan than simple hard labor is found, such as the process to which you have referred, taking time to think, taking advantage, and where men would not be tired out easily, and would work six hours per day, they would be able to produce better and to live longer and more happily.

The man to whom I referred as having gone through this experiment was not coached by anybody. He simply used his judgment, knowing that he was upon test, and doing it without physical harrassment; he looked at his work and took time to judge as to the best process to follow, and followed it, and proved that the plan was successful. The employer might have introduced the seven-hour workday in his works, but after the experiment, the man being paid eight hours' wages for seven hours' work, so to speak, finding that his output was just a little better than it was before, he thought he ought to be compensated in accordance with the extra production, to which the contractor objected. He thought when he was paying him what he claimed was eight hours' wages for seven hours' work, the man should not look for an addition—which is a pretty conclusive answer to the scientific management argument, that by the practice of it the man who would do the extra producing would get the extra pay. We have no knowledge of that in so far as practical work is concerned. All our knowledge of advantage to the workman goes the other way.

Mr. THOMPSON. Let us see if I understand it correctly. In that case he was to get the former eight hours of wage for seven hours' work?

Mr. DUNCAN. Yes.

Mr. THOMPSON. That would be a certain advantage to the worker?

Mr. DUNCAN. Yes, sir.

Mr. THOMPSON. If every worker could get an hour off each day that would be of at least some advantage?

Mr. DUNCAN. Yes.

Mr. THOMPSON. In fact, from the union standpoint that is a very great advantage?

Mr. DUNCAN. It is very great.

Mr. THOMPSON. So considered in organized labor?

Mr. DUNCAN. Yes; very great.

Mr. THOMPSON. That was some advantage to the workers?

Mr. DUNCAN. Yes, sir.

Mr. THOMPSON. On the other hand, the advantage that the employer took was a little increased output. In a sense that presented a case where the benefit was split, perhaps not altogether fairly, but at least it was not altogether solely to the advantage of the proprietor, was it?

Mr. DUNCAN. No. There are so many other things that enter into it that that point you are making would be offset. For instance, the employer has to pay the tool dresser a certain amount per day per man that he sharpens for, and that is governed by the number of tools, and the better the workman the fewer tools he uses. A tool sharpener could sharpen more tools for expert men than he could for others. I had in mind when I made reference to this instance the point that you make.

In the experiment in question the employer was fairly well satisfied. He did not believe, however, that he could change his works to seven hours—not then—with everybody around him working eight hours. He is not dismayed as to his experiment and has invited our association to consider the advisability of reducing the working day perhaps to seven and one-half or seven hours, which is a vague proposition to us at the present time, because it took us a quarter of a century, with all the political influence we could get in Congress, as well as our efforts in our own union, to get the eight-hour day established, and when we will get the seven-hour day is at the present time beyond my comprehension. We got the eight-hour day by trade effort and by congressional action.

Mr. THOMPSON. Generally speaking, if, as you say, union labor could show to the world that it could accomplish more for the benefit of the world by having a seven-hour day than an eight-hour day, would not labor make that demonstration?

Mr. DUNCAN. We have done it. They used to work us in the summer time 11 and 12 hours per day, and eventually we got the work down to 10 and then to 9, and now to 8 hours a day, and, excepting the employer whose head, as we think, is not set on his shoulders the right way, the employers would not return even to the 9-hour day.

Human nature is a peculiar thing, and even with the knowledge that our men are cutting as much granite in eight hours as 15 or 20 years ago they did in nine does not satisfy some of our employers. They still want a little more, but the employers agree that our men are cutting, except in the very hardest portion of the trade—that is, requiring the very hardest human exertion—as much in 8 hours as we did in 10 and 11, and the finished product to the purchaser is, if anything, reduced in price to what it was then. Machinery may have something to do with that, but the keenness of the workman, his working more steadily and having the shorter day, which gives him leisure that he did not previously enjoy, all adds to his producing ability.

Mr. THOMPSON. Still, the general statement is true that if labor could show to the world that it could produce more by working shorter hours it would do so; it would take the shorter hours and give to the world the increased benefit, would it not? Is that correct?

Mr. DUNCAN. Yes, sir.

Mr. THOMPSON. Mr. Chairman, we are through.

The ACTING CHAIRMAN. Mr. Garretson, have you any questions?

Commissioner GARRETSON. Mr. Duncan, is it not true that the methods of the workman, the ways in which he performs his labor, as well as the methods of his manager in conducting his business, are largely temperamental?

Mr. DUNCAN. Yes; largely.

Commissioner GARRETSON. That a man does his work precisely as he meets the other conditions of life—in a different way from what some other man does?

Mr. DUNCAN. Absolutely.

Commissioner GARRETSON. In your opinion, Mr. Duncan, if it is legitimate to apply so-called scientific efficiency methods to the workman, would it not be equally consistent to apply them to the management of the business? If it is consistent for the workman to have to do everything in exactly the same manner, according to a code prescribed, would it not be equally consistent to require the business should be managed by just such a code?

Mr. DUNCAN. That is what we call in our industry "overhead charges," and there is nothing that will cause so much despondency in the working ability of a journeyman granite cutter as to see around him a boss, a superintendent, a foreman, and several others in the office, all reaping the benefits of the employment of a few men, when perhaps one or two at the most of those men would accomplish all the others are doing and the expenses of the industry charged up in a lump sum to the workmen upon the job would be largely reduced.

Commissioner GARRETSON. You misunderstand my question to a certain extent. I mean as to the methods that will be followed by the men holding just the same position in administrative capacities. If repression of individuality in the method of working is desirable for the man, as a boon to the man, would it not be equally beneficent to the management to repress initiative?

Mr. DUNCAN. Absolutely so.

Commissioner GARRETSON. If we follow that out clear through all the pursuits of life, if it is consistent for the man that labors, would it not be consistent in every pursuit?

Mr. DUNCAN. It would.

Commissioner GARRETSON. The result would be that we would have embalmed management, just as we have embalmed music. If it is good as applied to labor, why should it not be good as applied to legislation, for instance?

Mr. DUNCAN. I thoroughly agree with the deduction. I had the honor, a short time ago, to speak on this subject before the New York Economic Club, and one of the points that I brought out was similar to the question you now put, only I had applied it more directly to the legal fraternity than to shop management. I do not know anything in connection with scientific management where its beneficent results, if it has any, could be better applied and better exemplified than in trying it upon the legal fraternity, not only in so far as their general line of work is concerned, but their practice before the courts, and applying it to the courts themselves.

By that I do not desire to express any opinion derogatory to our judges. They have to meet conditions as they come. However, the judges can not always alter the practice before the court; and if the same scientific management which is attempted to be applied to the man behind the hammer were applied in the legal profession, for instance, they would have a first-class chance to exemplify their theory, and doing it among themselves they would no doubt be

able to produce the best results, although I think that long before their investigation was over they would conclude that the practice or the experiment was a humbug.

Commissioner GARRETSON. Have you ever formed any conclusion as to whether or not the legal fraternity would accept it until they were convinced that it was for their interest to do so?

Mr. DUNCAN. I am in doubt about it, then.

Mr. THOMPSON. As a member of the lawyers' union I will say that I will accept the application of the efficiency system there as Mr. Duncan has expressed it.

Commissioner GARRETSON. Going back to the example that was given a moment ago of the eight-hour man doing the labor of the eight hours in seven, if the fatigue caused by the necessary exertion to do the eight hours work in seven hours was of such a character that it took him the other hour to recover the normal condition that would have been his if he had done the work in eight hours, would the giving of that hour be any boon to him?

Mr. DUNCAN. No; but I do not think that would be the result. It might in some instances, but generally I think not. I do not believe that the shortening of the hours of labor has yet reached the balance. I am of the opinion that, especially among trades where the workmen and workwomen do a great portion of the work by their hands, six hours comes pretty nearly being the balance of a working day. By that I mean that while it follows that ordinarily as much work is being done in 8 hours as had been done in 10, I do not desire to create the impression that if it were reduced, and reduced, and reduced they would finally be doing as much in 1 hour as they had in 9 or 10. I think about six hours would be a happy medium. If they want below that I question whether the results would be beneficial.

Commissioner GARRETSON. In connection with the purely academic idea that a man should be able to have the day divided for him so that he would have a very reasonable period of rest, a reasonable period for work, and a reasonable period for human recreation, do you believe that it ever was associated with the idea that in order to secure a reasonable length of working day to conform to that idea, that within that period he must perform as much work as if the working day of 24 hours were divided into two shifts of 12 hours each; for instance, that he would do as much work in 6 hours, taking that as your idea of what should be the working day as he formerly did in 12?

Mr. DUNCAN. Your question is quite a long one.

Commissioner GARRETSON. It is.

Mr. DUNCAN. But the idea of reducing the working day primarily was not for the purpose of expecting a man to do as much in 8 hours as he had done in 10 or 9. It was for the purpose of giving him an hour or two hours per day additional leisure from the drudgery of work, so that he could have the leisure time for mental and physical benefits.

Commissioner GARRETSON. It was just to relieve him of two hours' work?

Mr. DUNCAN. Yes; and so that he would apply the two hours in ways that would be of betterment to himself and to the occupation in which he was employed.

Commissioner GARRETSON. In other words, the two hours became his.

Mr. DUNCAN. Yes. I think all experience shows that where they formerly had two shifts of 12 hours each and then changed to three shifts of 8 hours each, where machinery and plants are required to be worked almost continuously, experience shows that the change from 12 hours to 8 hours was of advantage in every way.

A few years ago in discussing the merits of the pending 8-hour bill before Congress, and in connection with it Mr. Andrew Carnegie testified that a number of years ago he had changed the working hours in his plant. He was then active in the business. I do not mean by that to say that he is not active now, but what I mean is that he was more on the job, as we say. He said that he found that the change to 8 hours, three shifts of 8 hours each, was of great advantage in so far as the amount of work that the men turned out in 8 hours as compared to their previous 12 hours, but he was not sure that in the change from two shifts to three shifts the men were immediately doing as much in 8 hours as they had been doing in 12.

Commissioner GARRETSON. But they were doing more per hour?

Mr. DUNCAN. They were doing a great deal more per hour than when they had been working 12 hours. After he had practiced this as an experiment for some considerable time he had to abandon it simply because of the competition

of some other mills which refused to go through the experiment. The difference in the wages would not make up for the difference between the length of hours the men were working, and after he had passed the experiment he dropped back to two shifts of 12 hours each again, the same as he had done before, and he said he did it very reluctantly.

Commissioner GARRETTSON. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Lennon, have you any questions?

Commissioner LENNON. You spoke of the address you made in New York as dealing with the subject of efficiency in the industry?

Mr. DUNCAN. Yes; generally.

Commissioner LENNON. Will you file a copy of that address with this commission?

Mr. DUNCAN. Yes.

Commissioner LENNON. Now, I want to ask you regarding some details of these efficiency systems as they have come before the commission. First, I want to call your attention to what I think is the general statement of the men who have represented efficiency systems, that it is necessary to make a time study by a stop watch of all the different processes that the workman goes through to bring about the results of production. I want you to give us your views as to this application of time study by a stop watch, of all these different processes that the workmen go through, as to their advisability, as to their necessity, as to their effect upon the workman, and as to their effect upon industry as it appears to you.

Mr. DUNCAN. I fail to see of what advantage that would be in any event, except, perhaps, where a man or a woman were almost automatically following a machine; and then it would be the gearing of the machine more than the stop watch. But as far as men are concerned, working at a given industry with their hands and with the tools of their employment, the stop-watch proposition is nothing short of a farce. Two men never do the same thing in the same way, and what would apply in one instance would not apply in another; and the only advantage that the stop-watch process would have would be if it were applied upon each individual. But it is questionable if an experience gained upon one individual would be very helpful with another individual.

If a man were standing over me with a stop watch, however friendly I might be to his proposition, if he was watching my movements and telling me how to do this and how to do that, I would feel like an automaton, and that my individuality had been entirely cut out; that when I finished my work there would be no credit to me for it; that it would be because of the stop-watch system, and I would have to surrender my individuality and go by the process or I would have to quit the process and follow my individuality; and as far as I would be individually concerned as a mechanic, I would prefer to follow my own individuality and take chances upon the result.

Commissioner LENNON. The development of the evidence before the commission indicates that the idea of the use of the stop watch is to make the motions and the methods of doing the work practically exactly the same to every individual worker. Do you believe that would be practicable?

Mr. DUNCAN. A hopeless failure; a hopeless failure. As you are asking your question, I have in mind having been employed for some time cutting granite for the State, War, and Navy Building in this city, and I remember quite a large stone coming from the quarry and it was offered to a number of workmen to cut into what they call a window gap. It is in one of the windows in the building now. Some of the most expert men on the job—and there were from 150 to 500 skilled cutters upon the job, according to the appropriation—refused the stone because it would not make, as we call it. It was not large enough to produce what was desired. We were working on piecework. It was after the Government had abandoned the direct employment of men, and we were finishing the building by contract.

After these other men had refused the stone, one man came along and looked at it, and he went and cut a small space in the very center of it, what we call cutting a dental. If any of you are mechanical men you will know what a dental course is in a molding, and if you pass the building you will easily understand what I mean by cutting a dental. He cut the dental in the rough stone—a place right in the center of it—and as soon as he cut that space and applied the rule and square and his lines in a rough way, he took the stone in and cut it to the finished product.

No efficiency manager on the face of the earth and no stop watch or anything of the kind could supply the mechanical acumen of the man who did that.

It was about the last that any man would do in cutting the stone, and he did the very last thing first; and, as we say, he gauged the stone from this spot in the center instead of cutting the stone in the way that a man ordinarily would, letting the center take care of itself. I desire to bring out by that illustration the acuteness and keenness of the mechanical mind that can foresee things like that; that no stop-watch system and no method that could be applied to one man should be applied to another, because it would not produce a result anything like that or mechanical thought akin to that.

Commissioner LENNON. You apply this to the granite-cutting industry. Have you, through reliable avenues, information as to its application in the machine shop or in the molding shop?

Mr. DUNCAN. No; I have little personal experience of that. I only know that in a general way, in following a machine, there might be motions that the human being would have to go through that would permit of the machine being tensioned up and made to run more swiftly, etc. That might be possible. The same amount of mechanical skill is not in evidence when a machine is doing nine-tenths of the work and the human being is applying the other one-tenth as when the proportions are the other way.

Commissioner LENNON. In the consideration of this subject we have heard much regarding what is called the premium and bonus system of payment of wages; that is, where men or women in an industry perform more work than has been set under the stop-watch system of fixing the time for doing the job; that they shall be paid a premium or a bonus for having accomplished that work in a shorter time, or having accomplished their stunt or task in less than the time set by the time study. What do you think of that method of payment? What will result from it?

Mr. DUNCAN. I know nothing favorable to it. We have in most of the mechanical trades, where there is much evidence of the use of the hand tools, a system of agreements with employers that comprehends a minimum wage rate. Then workmen are to be paid as much higher than the minimum as their producing power will warrant. That is the theory of our agreements. In some instances it works out very well. It gives to the swift workman compensation for his ability, and because of the higher wage rate paid to him there is that much protection to the slower workman who produces less and is paid less and has then a proportionate opportunity of employment. That course usually follows what we call real mechanical ability, and among workmen that idea can not well be put into words nor written into a book. Men working together, belonging to or following a certain occupation, can tell by a man's actions whether he is performing a certain thing by improved or increased mechanical ability or if he is doing it through a method of waste to himself and by force, as it were, and perhaps, in a vulgar sense in the trade, we call the difference the payment of blood money. A man who is working beyond his mechanical gait in order to earn a certain price above the established wage rate and for the sake of gaining a so-called premium is said to be working for blood money, which usually has the effect of putting a man into his grave from 10 to 15 or 20 years earlier than he would otherwise go.

In many portions of my own trade the employers consider the minimum wage in the agreement to be the maximum rate in the office and pay the men a flat rate. That applies more west of the Mississippi than east of it. Then, they figure that one man is a little slower than another, and the good man makes up for the slower man, and the employer has a fair average out of it, and he pays them all alike.

The process of paying men above the maximum is plentifully in use in the New England States, where the most of the trade of which I am a member is followed, and with, for instance, \$3.40 minimum for an eight-hour workday, the wages will grade from that rate to \$4 and \$4.25, and sometimes as much as \$6 per day, according to a man's ability; and when the extra price is paid it is seldom that there is any evidence of the man earning it because of extra exertion; it is usually through extra mechanical ability, and the employer pays him the increase in order to retain him, or, as he says, to keep his competitor from getting the man.

Commissioner LENNON. Mr. Duncan, one of the cardinal principles of organized labor is that of collective bargaining as to the wages and conditions and hours, and those things which generally have to do with a workman's application of his ability in the shop or factory or yard. That is usually the subject of collective bargaining, as between the union and the employer. That is a fact, is it not?

Mr. DUNCAN. Yes.

Commissioner LENNON. Do you see any obstacles in the way of collective bargaining in connection with these efficiency systems, so far as they have come under your observation? For instance, as to time study and premiums and bonuses and those things?

Mr. DUNCAN. One result that I would expect from that would be—perhaps not right away, but certainly soon—quite a reduction in wages. We had the piecework system for many years in our trade, and it was abandoned by mutual consent, no resolution having been passed when it was abandoned by our association or by the employers and their associations, nor by any of them individually. During the time that we were working piece rate, men would be selected because of their ability to turn out a certain piece of work as quickly as possible, and the man who was selected to do that would be paid according to the rate that had been made by collective bargaining. But when the next time came to make another collective bargain the rate per foot that these fast workmen had been able to turn out—the price per foot—was gradually reduced. They took the output of the fast workmen as a criterion for the others and simply said that the others were incompetent as compared to this fast workman, and they desired to reduce the wage rate per foot so that the expert, skilled man would be paid perhaps two-thirds of what he had been getting, or less than that, and the others would be reduced in pay accordingly. That method of premiums etc., paid to men to produce extra work, has never in my knowledge had any other effect than sooner or later to reduce the wages.

Commissioner LENNON. That is all I care to ask, Mr. Chairman.

The ACTING CHAIRMAN. Mrs. Harriman?

Commissioner HARRIMAN. Mr. Duncan, is there any phase of the efficiency system of which you do approve?

Mr. DUNCAN. Yes; the general efficiency system to which I have referred, the general efficiency system that is found among workmen taking advantage of everything that would tend to promote them, to turn out a fair day's work or a finer job. They are continually doing that; that is in evidence all of the time.

I am very glad that you asked me that question, Mrs. Harriman, because it gives me a chance to answer it in this way: The difference between the two lines of thought is the difference that exists between practical efficiency and theoretical efficiency. Practical efficiency is always in evidence, and that is what has produced the greater producing power of workmen to-day, as compared to the past, and so on. The theoretical efficiency argument is advanced by those who, like every other theorist, believe that if certain things are done differently from what some particular man does them they would necessarily be correct, because they followed certain theoretical lines. We believe in all phases and forms of efficiency in management and mechanics that can be practically applied—all of them.

Commissioner HARRIMAN. The system that we hear about, then, you claim to be theoretical?

Mr. DUNCAN. Yes.

Commissioner HARRIMAN. And the other kind to be practical?

Mr. DUNCAN. Yes.

Commissioner HARRIMAN. In other words, you believe it should be left to the individual to be as efficient as he can?

Mr. DUNCAN. No; it is left to them collectively. The competition that is among them makes them that, and the men who are trained in different occupations must necessarily know more about it than a person who has not had the advantage of training that they have had. The manager, superintendent, or the firm or individual, if he knows the plant, will require his foreman to always do more and more. He always wants more, and the foreman in return, in order to keep the favor of his employer and to show his value, is endeavoring all of the time to produce more and more. One of the methods he takes, apart from counseling with his men and showing them how to do this or that to advantage is to discharge the slow ones, the less efficient ones, which spurs the others on to look for methods and plans of accomplishing more. The whole process of efficiency is in evidence from the time a mechanic lifts his hammer all the way through to the employer in the office.

Commissioner HARRIMAN. That is all.

The ACTING CHAIRMAN. Mr. O'Connell?

Commissioner O'CONNELL. Mr. Duncan, the law creating this commission provides that it shall seek the causes underlying industrial unrest and make

some recommendations to Congress in the matter. Do you consider that the fact that the so-called efficiency or scientific management systems have not been introduced in the factories or workshops of this country is a cause of industrial unrest?

Mr. DUNCAN. No.

Commissioner O'CONNELL. Briefly, in your opinion what is the underlying cause of industrial unrest?

Mr. DUNCAN. Mr. Chairman, that is one of those questions where it can be asked in a very few words, and a man, in endeavoring to answer it, would take two days and then not get very far into the subject.

Evidently, judging superficially, there are more workers than there are jobs. Men and women are required to work too many hours a day for their own good or for the good of the country. If there were a shorter workday, and therefore greater opportunities given, and some rational and practical limitation to immigration, so that immigration would be in accordance with the needs rather than flooding the market, there would not be the great unrest and visible idleness that we see at the present time.

Commissioner O'CONNELL. Then if the idea of the efficiency people were carried to the extreme the fact that there are more men than there are jobs would be intensified?

Mr. DUNCAN. It would.

Commissioner O'CONNELL. Because we are told here by all of the experts who have appeared before us that under their system men produce from one hundred to three and four and five and six and seven and eight hundred per cent greater; that there is more product when they have put their plans into operation, and necessarily there must be a reduction of the force in such plants, unless the plants gather an immense increase of business. To that end, then, the efficiency idea would only intensify the conditions of industrial unrest and the unemployed situation.

Mr. DUNCAN. The efficiency managers, in so far as their writings are concerned—and they are all theoretical—somewhat conflict one with the other on that point. Some of them, I think Mr. Emerson, hold that the application of scientific management would mean, perhaps, a shorter workday. In any event, it would mean more compensation to the worker and steadier employment; but I think he also links to that fact the fact that there were three or four million immigrants who came into this country in about three or four years, and he applies the fact of all the immigrants coming here to an absolute need for them, else they would not have come.

The other point in which they are not practical is this: They will tell about the number of motions they require a mechanic to go through, eliminating perhaps two-thirds of them, and that then he can produce so much more. One of their illustrations is that of a bricklayer. They propose to cut out more than half, or nearly two-thirds, of his motions when he is laying bricks, which of necessity means that by the elimination of each motion they are supplying that same labor power by some one else. That is the only theory on which they can claim they would retain anything like the same number of people employed—that is, by diverting the work that a skilled bricklayer would do to a less skilled man, perhaps a handy laborer, or something of that kind, which would mean that a portion of the work now done by the bricklayer at \$4 a day might be done by a man less skilled in any other capacity at \$2 or \$2.50 a day. Then, all the other motions, the preparation of the brick, of the material before it came, so that the mechanic in placing his work could do it in much less time, must necessarily be supplied by somebody else before it gets there; somebody else must do some portion of it in this automaton system to which I have referred, and if they carried the same number of employees as before all the difference would be that a great deal of the work would be compensated for at less wages than before. That might be an economy and an economic gain to the populace, while it would be a loss to the mechanic.

But speaking generally, if there is anything about the theory of so-called efficiency management, and the stop watch process, it would add to the trouble that we have at the present time, in the great unrest and the amount of idleness that is present.

Commissioner O'CONNELL. We are told here that some of these experts have been engaged in this business for 30 or 35 years, for instance. Mr. Taylor, for instance, has been engaged in the work for over 30 years. Others have been engaged for a certain number of years. Have you ever heard of or known of a case where the hours of labor have been reduced in a factory or workshop or plant as the result of this system of management being introduced?

Mr. DUNCAN. Never. I have known of some instances where for evidently good economic reasons employers have voluntarily made a reduction of hours, in expectation of something to meet it. But in nine-tenths of the cases where hours have been reduced it has come from the beneficent efforts of organized labor, and other trades not organized have profited by the advantages of the organized worker.

Commissioner O'CONNELL. So far as you know, you never have known of the hours being reduced because of the introduction of scientific management?

Mr. DUNCAN. No.

Commissioner O'CONNELL. That is all.

The ACTING CHAIRMAN. Mr. Weinstock?

Commissioner WEINSTOCK. Mr. Duncan, you told us how in your industry the hours of labor, as the result of about 25 years of effort on the part of organized labor, have been gradually reduced from 10 hours to 9 hours and from 9 hours to 8 hours.

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. Are the men producing as much in 8 hours as they formerly produced in 9 or 10 hours?

Mr. DUNCAN. Excepting in the portions of the trade where the work is very laborious, very heavy and hard, I think they are producing a little more, but this must be borne in mind in connection with that, that during the time this economic change has taken place there have been many new tools introduced in the trade, especially machine tools, which have gone toward helping to turn out the finished product. However, upon work where men are not using much, if any, of the improved tools, the shorter workday finds them working, if not every minute of every hour, practically so, more steadily, applying themselves more diligently to their work, because a workman who has his life in his work desires to produce a day's work and he wants to produce it.

The shorter workday gives them an additional advantage in that the workman is not tired out, as he would be otherwise.

Commissioner WEINSTOCK. So, on the whole, you would say that the trade is turning out on the average per man as much in 8 hours, if not a little more, than they formerly did in 9 or 10 hours?

Mr. DUNCAN. Yes; and I think that will be borne out by nearly all of the employers in my trade who have been in business that long.

Commissioner WEINSTOCK. You further said that you believe that ultimately a six-hour day will be the happy medium for a working day.

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. Have you faith enough in the possibility of the men in the trade to think that the time will come when a man in six hours' honest, earnest work, intelligently applied, will be able practically to produce as much as he is producing now in eight hours?

Mr. DUNCAN. In this way I have no doubt of it. While the evolution is coming on to a reduction to a six-hour workday, I anticipate the same ratio of inventions will apply in the way of supplying tools and machinery to produce, and with the expert ability and the skill of the workmen, possibly the additional machines too that will be invented to put in use, the product will be more, a little more.

Commissioner WEINSTOCK. That is, it will develop men's brains?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. Along the lines of higher inventive genius?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. And it will develop the workers' methods along the lines that with less physical effort he will be able to accomplish substantially as much as he is accomplishing now?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. Do you regard the man or the men who have been able to bring about this reduction in hours, without any injury to the worker and with benefit to society, as a friend or an enemy to the worker or to society?

Mr. DUNCAN. As a friend.

Commissioner WEINSTOCK. If you were able to-day to bring about a six-hour day along the lines you have outlined, do you believe that you ought to be regarded as the friend or the enemy of the worker and of society?

Mr. DUNCAN. I would say that I was the friend of the worker and of society.

Commissioner WEINSTOCK. I think we are both in accord on that point.

Mr. DUNCAN. Absolutely.

Commissioner WEINSTOCK. That being the case, is it not evident that when men were working on a 10-hour day they had not developed their highest efficiency, as seemingly has been demonstrated by the fact that to-day in eight hours they accomplish, if anything, a little more than they formerly did in 10 hours? I suppose that must be proved, that when they were working on the 10-hour basis they were not working to their fullest efficiency—perhaps not intentionally, but ignorantly?

Mr. DUNCAN. I do not think ignorantly, but I think this, that they were not doing it—but not ignorantly. I think the reason they were not proportionately producing more than now is because of the drudgery, the harassment of the work, and because of their being tired out, both physically and mentally, because of a long workday. I consider myself yet a young man, but the 11-hour workday had passed before I began to work at my trade. Then hours is the longest I have worked, and when I had some distance to go to work, to start at 7 o'clock in the morning, with an hour at noon, and worked until 6 o'clock and then would go home, and after I got home and got cleaned up and had my dinner—what society people call dinner, but what we call supper—I did not have a great deal of ambition during the balance of the evening, and unless there was something that called me out, I was very prone to sit down in my boarding house and fall asleep.

I worked in New York City at my trade when I was a boy, and any of you that know the workingman's section of that city will know what I mean when I say that in the summer time I used to climb up the inside stair to the roof to rest and cool off a little and get some fresh air, and either my roommate or the good lady that I boarded with used to come up and rouse me and tell me that it was time to go to bed. Of course, that did not follow every night, but I say, unless there was something to keep me in of an evening or to go to a meeting, very likely that would be it. I did not have any ambition to sit down and study or go to a library and look for any of the things to relax a person, and the next morning I used to do the same thing, and when it came Saturday night I was a pretty tired man. And then Sunday used to pass very quickly, and it seemed to me that Monday morning came after Saturday evening very suddenly.

The change from that to the eight-hour day gives a man a different chance entirely. Some of the most expert baseball players that there are in this country, that this country has ever seen, are men who learned their trade and worked at it and played ball in the evening and in their spare time, and principally since we had a reduction from the longer working day; and they did it with vim, and so forth, and we have enjoyed this in other parts, and they live better, and there is a general betterment all around, all around, that is reflected in their work and in their lives, which can be seen in the appearance of their children at the present time as compared with a quarter of a century ago; how they dress and how they go to school, and all that, and it is evident all the way through that there is a different ambition in the man. He has been humanized, as it were, and he has ceased to be the drudge that he was, and with a little spare time—some of us are not all human and do not employ the time to the best advantage, but that is the exception. The rule is that they have had general betterment individually and in their families, and it is reflected in their work.

Commissioner WEINSTOCK. I take it, Mr. Duncan, that the man or the men who have been able to bring about this change in conditions which you have described to us in so interesting a manner, so that it is possible to-day to produce even more in 8 hours than it was possible to produce in the past in 9 or 10 hours, he has certainly been a benefactor to the worker and to society generally?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. Now, I take it from the opinion you have expressed that we have not reached the limit—that eight hours is not the limit?

Mr. DUNCAN. No.

Commissioner WEINSTOCK. And that you venture to forecast that the time is not distant when six hours will take the place of the present eight hours; that if it were possible to bring that about to-morrow, whoever would do that would likewise be a benefactor to the individual and the rest of us?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. And that anything that will make that more possible ought to be encouraged?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. And that if you could be satisfied that efficiency systems, or so-called efficiency systems, by whatever name you call them, would help along those lines, then that efficiency system would be in the nature of a blessing?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. Now, the only issue between you, for example, and the gentlemen who represent these efficiency systems is the question: Will it bring that about? Will it hasten that day? You think it will not and they say it will. It will have to be admitted that they have brought evidence before this commission to show that it has done that. We may disagree as to the degree in which they have done that, but that it has been done to some degree I think remains undisputed, because facts were brought out before this commission that were not denied and not disputed; that output has been increased; that profits have been increased; and that the workmen's earnings have been increased. That has been generally admitted wherever the so-called systems have been intelligently and fairly applied and where the men have cooperated with the promoters. The only point at issue that is yet to be determined, as I see it, is whether this increased profit and increased output and increased earnings were gained at the physical cost to the worker. It is claimed, on the one hand, that it has come "out of the hide of the worker," and that claim is denied on the other hand, and that point is yet to be determined; but that it has been made more possible to cut hours of labor and still maintain the output as large as was put forth in the past I think has been clearly demonstrated. Whether it applies to your industry, of course, I could not say, but would you say that because, in your opinion, these so-called efficiency systems could not increase the output in stonecutting that it could not increase the output in any other industry?

Would you, for example, want this commission to take the conditions applying to your industry and make a character for all industries?

Mr. DUNCAN. No.

Commissioner WEINSTOCK. Or do you appreciate the fact that there are different conditions in different industries?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. And that therefore because it may not apply to your own industry, it may apply to other industries?

Mr. DUNCAN. I have been through the State of Missouri twice, and those what you call scientific managements have got to show me; they are what I call theorists. I claim we have more scientific management, so-called, in evidence in the different occupations than is in evidence or can possibly be in evidence by the theorists. Speaking generally, I am of the opinion that the stop-watch system and everything that goes with it, are perhaps applied nearly as much in the machinists' industry as perhaps all others combined. I may be wrong in that proportion, but I am not very far wrong.

Commissioner O'CONNELL. If you said three times more you would not be wrong.

Mr. DUNCAN. Well, perhaps. They usually say I am terribly conservative, and I will hold onto that. I do not want to spoil my reputation before this commission.

If there is anything to their claim, it should be reflected in the machinists' business. I do not think that any man, even of a theoretical mind, will doubt but there is perhaps as much, if not more, skill required in the machinists' industry as almost any individual employment.

Now, what do we find among them to-day as to these benefits to which you have referred? The organized and unorganized machinists of North America will not average as much in wages—I doubt if they will average as much in wages as a hod carrier. There is scarcely a building trade but is paying much higher wages than a man in the machinists' business. In some of the building trades the wages are twice as high, and there are few if any building trades now where the workingman works more than eight hours per day; and I doubt if there is 10 per cent of the machinists of the country working 8 hours per day. If, therefore, there is all of this advantage to the theoretical scientific management that the advocates of it claim, it should be reflected somewhere, and that would be the place where it would be in evidence. I suppose they will take the condition that exists among the men in the machinists' business at the present time and compare it with what it was 5 or 10 or 15 years ago, and say, "There, there is our proof," but the reduction from 10

hours a day in the machinists' trade to 9 followed the general claim for an 8-hour day by other trades, and I would not be surprised, from my knowledge and experience, if the building trades will not be down to 7 hours' working day by the time the machinists get down to 8, with all the advantages scientific management can apply to them.

Commissioner WEINSTOCK. You point out, Mr. Duncan, that the raise in wages in the building trades has been much greater than the raise in wages, for example, among machinists?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. May this not explain that fact, that the building trade is largely a noncompetitive business: Let us take the city of Washington, for example. If I want to build a house in Washington I can not import that house from New York or San Francisco or New Orleans. It has to be constructed here. If the workers in the building trades organize strongly in Washington they can dictate their own terms, and I have to practically submit. The contractors are quite willing to pay that, because as long as they all pay it is no disadvantage to either. They simply transmit that burden to me as the owner of the building. But when it comes to buying a machine I have the whole United States to compete with for that sale. In fact, I have the world. Therefore, the machinists' business is a competitive business and the building trades is a noncompetitive industry, and therefore, it being noncompetitive, it comes very nearly to being in the nature of a monopoly, and wherever you can establish monopoly there you can fix your price.

Mr. DUNCAN. Your statement is very largely akin to the theoretical argument of the scientific managers. When applied practically, and its base is knocked from under it, naturally the whole of your argument would fail.

In so far as the building industry in the city of Washington is concerned there is very, very small percentage done here. None of the stone for it, whether it be hard or soft, is cut here. The iron is not made here. The brick is not made here. Certain of the timbers may be trimmed before they come here. Most of the woodwork, the sheet-metal work, and everything is put together here. There is competition between the marble man and the granite man. The terra-cotta man is after them both. The iron workers and the cement league, so-called, are after everything of the kind, and the carpenters are trying to maintain a relic of the past art or craft of carpentry, which is fast passing away, as the result of the use of artificial materials and metal and that sort of thing. So the competition for your house to be built here in Washington is as keen in every particular as the purchase of any part of machinery coming from where it may.

Commissioner WEINSTOCK. That is true, but that—

Mr. DUNCAN (interrupting). The only point that would apply would be this, that after the material is contracted, by whomsoever may contract it, from Maine to California, and sent here, the building trades in Washington might concentrate and say certain conditions shall be applied in connection with the execution or erection of the material; but the same thing would apply in connection with machinery. Wherever it is made and sent, the assembling of the machinery by the machinists would be subject to the same proposition; by lining up all the other iron trades, they could do the very same thing. So there is practically no difference between them, and there is as much competition, perhaps more competition, except in the iron industry, in so far as the building is concerned, than in almost anything else you could apply to the erection of your house or your office building, as the case may be.

Commissioner WEINSTOCK. If the building trades are not thoroughly organized in the city of Washington, what you say would hold. But if they are thoroughly organized, as they are in my own home city of San Francisco, it would not hold, because when it came to the question of erection or assembling of these materials, regardless of what competition in getting the materials, the hod carrier is in a position to demand \$4 a day, which is more than the machinist gets, more than the minimum wage of the machinist in San Francisco, which is \$3.50.

Mr. DUNCAN. Did the scientific manager help to get the hod carrier that price?

Commissioner WEINSTOCK. No; he did not.

Mr. DUNCAN. No.

Commissioner WEINSTOCK. You further point out that two of the underlying causes for unrest, as Mr. O'Connell suggested, could be minimized, as you point out, by the shorter workday and diminishing immigration or restricting

immigration. Are we to gather from that that one of the causes of unrest is overproduction; that there are too many men to do the work; that we are producing too much for the number of hands we have to produce it?

Mr. DUNCAN. We are evidently producing faster than the market can consume, or else there would be a demand for the employment of those who are unemployed, and then we would not have this social unrest.

Commissioner WEINSTOCK. If it was a case of producing, would we help matters, would we increase prosperity, would we better the condition of the worker if we cut down our production?

Mr. DUNCAN. No.

Commissioner WEINSTOCK. We would not?

Mr. DUNCAN. No; a better distribution of it would be all right, but to cut it down would mean the release of a certain greater number of men and women that are now employed.

Commissioner WEINSTOCK. Then, distribution would be purely a matter of marketing?

Mr. DUNCAN. No; not entirely; not entirely. For instance, in an employment where men and women are working 9 or 10 or 11 and sometimes 12 hours a day, if they were brought down to 8 or 7 or 6 hours a day there would be more people employed; there would be a greater consuming power; the consuming power of the populace would be enhanced, and therefore there would be greater consumption of the finished material.

Commissioner WEINSTOCK. But I can not reconcile that with your previous statement. I can not reconcile that with your statement made a little while ago that men are producing as much in 8 hours as they formerly produced in 10, and that you hope to see the day when men will be practically producing as much in 6 hours as in 8.

Mr. DUNCAN. I do not entirely blame you for not seeing my point in that, for I fear your mind is running along the theoretical line. By producing more we are selling a great deal more. We are not housing it up. The fact that we are producing it shows there is a market for it.

Commissioner WEINSTOCK. Very well. But if the output to-day is, say 100, is represented by the figure 100, and if we can produce that same 100 in 6 hours in place of 8 hours, we will not have increased the opportunity for employment. We will have exactly the same number of people producing that 100, only they will do it in 6 hours in place of doing it in 8 hours.

Mr. DUNCAN. That does not follow. When we changed from 9 to 8 hours a day, in the first two or three years after we did that, more people were employed than ever before in the history of our trade for the amount of stuff that was turned out at the time. That has gone on since then, but the change was very marked, and the advantage of the reduction in hours of labor usually is to create a healthy market for the product. In the first place, it employs more people. A man could not work to-day 10 hours and to-morrow be put on an 8-hour day and do the same thing in 8 hours as he did to-day in 10 hours, because his mentality and his physique and everything about him is still upon the 10-hour basis. It required a development, and in the course of that development more people are employed, and with the more people employed the consuming power is increased.

Commissioner WEINSTOCK. Then that simply means not that you employ more people to make the same output that you have to-day, but that you are steadily increasing your market for that output, and by increasing the market you are giving employment to more people. In other words, if we could double our market to-day; if, instead of selling 100 machines, we found a market for 200 machines, we could naturally employ a good many more people than we do to-day. But if we limit our output to 100 and could find no market for more than 100, and if we could take the men who are working on that 100 machines to-day, and put them on an 8-hour basis and get them to turn out those 100 machines, or if we could take the men who are turning out those 100 machines on an 8-hour basis to-day and put them on a 6-hour basis, we will not have opened the door for more workers.

Mr. DUNCAN. You evidently can not conceive of the fact of the change bringing more workers into use and making better distribution of the money of the country and the producing power being increased accordingly. The opposite was tried, you know—I know that you know it—and it was found to be a failure. It used to be the custom in factory work that whenever there was a sluggish market they began to reduce—sometimes they increased the time and reduced the wages so as to make the product cheaper in order to get

rid of it. After years of trying that and it having proved that the consuming power was not increased, they have changed that plan now, and when the market becomes dull they reduce the number of working hours.

Commissioner WEINSTOCK. I want to make the point clear in my own mind, Mr. Duncan, and I think I can do it by asking two or three questions, if you will be kind enough to answer them by yes or no. First, in your trade men are producing as much, if not more, than they did—they are producing as much on an 8-hour basis now as they did formerly in 10 hours?

Mr. DUNCAN. Yes.

Commissioner WEINSTOCK. Secondly, there are more men employed in your trade to-day, doubtless, than there were when the 10-hour day prevailed?

Mr. DUNCAN. Yes, sir.

Commissioner WEINSTOCK. Then if there are more men employed to-day than there were when 10 hours prevailed, it is not due to the fact that men are producing less in 8 hours than they formerly produced in 10; it is due to the fact that there is more demand for your product.

Mr. DUNCAN. Brought about by the change. You can not disassociate the one from the other.

Commissioner WEINSTOCK. It is due to the fact that there is an increased demand for your products—not due to the fact that men are doing less work now and therefore it takes more hands to do the same amount of work?

Mr. DUNCAN. The distribution is better.

Commissioner WEINSTOCK. Therefore, the secret lies here, if we are to give more employment, if we are to minimize the ranks of the unemployed, we can not hope to do it by shortening hours pure and simple. We must hope to do it by lessening costs with a view of broadening the demand and increasing the market for that which we produce. Is that right?

Mr. DUNCAN. I can not conceive of a condition of reducing the hours "pure and simple." When you say "pure and simple" you produce a different condition entirely. There is not any "pure and simple" about it. Everything that hinges upon the main question goes with it, and to disassociate the main question from the things which surround it is not a fair proposition.

Commissioner WEINSTOCK. That is all.

The ACTING CHAIRMAN. Mr. Duncan, you naturally want this commission to put themselves in your place and get your point of view on this question, and, I think, therefore, perhaps, it is not unfair that we should ask you to put yourself in our places and assist us somewhat in our investigations. You are familiar with the fact that this commission represents three different parties in interest, and that we are trying to discover some common ground upon which we can arrive at a harmonious report. It would not help the public to have two or three reports on this great fundamental question. I do not think it helps the question very much to try to develop the fact that there is an irreconcilable conflict or anything of that kind. It seems to me our efforts should be to try to find out where the points of agreement are, if we can do so. I want to appeal to you on that basis for help. I do not have to ask you whether you are a believer in collective bargaining, for I know you are.

Mr. DUNCAN. Yes, sir.

The ACTING CHAIRMAN. And I do not have to ask you whether you object to the introduction of machinery, because I know you do not.

Mr. DUNCAN. That is right.

The ACTING CHAIRMAN. That being so, do you object to improvements in methods, provided always that the workmen are safeguarded and are not deceived in the introduction of the methods.

Mr. DUNCAN. No, sir.

The ACTING CHAIRMAN. You do not object?

Mr. DUNCAN. No, sir.

The ACTING CHAIRMAN. That appears to me as one of the fundamental difficulties, and if that could be brushed aside we would make some real headway. Is that correct?

Mr. DUNCAN. Yes, sir.

The ACTING CHAIRMAN. I am somewhat familiar with the granite industry. I lived in your town for six years, when I was a boy. There have been immense improvements in the cutting of stone by machinery in the 30 years past?

Mr. DUNCAN. Yes.

The ACTING CHAIRMAN. How were those improvements made? Were they just made out of a clear sky by some inventor, or were they made by careful study of the process of cutting stone?

Mr. DUNCAN. Both. Some of the most effective tools, in cutting granite at the present time, were more or less accidents. Men were groping for something, and here and there some fellow would fall upon a process. For instance, one of the most effective tools there is in the business is what we call a large surfacing machine. I suppose it would appear strange to you to know that the whole process of it was discovered through a man of our trade watching a brass worker. He was some kind of a machinist, I have not in mind at the present time just exactly what. I think he made seals and things like that. You will find sometimes on metals—gold, brass, and copper, an ornamentation, a rough coat that is produced by dabbing—a dabbing machine—upon a plain surface after the plain surface has been made. Sometimes they call it rustication. It was originally put in metal to form a contrast between the finely molded and polished portions of the ornamentation, and the portion which would be what we call dabbled. The process by which that man was using the machine was to turn it with his foot, and, having a little tool, he would do this dabbing and this would make it rough and a little coarse, and that suggested to the man who invented this surfacing machine the idea, or it gave him some of the groundwork for his invention. From such a crude beginning as that the machine was finally evolved, and is in use at the present times. That machine will do easily from 10 to 12 times as much work, guided by a man, of course. The machine does not work automatically, but the product in a day would be 10 or 12 times the product of manual labor.

The ACTING CHAIRMAN. Has the labor gotten any of the advantage from the introduction of machinery?

Mr. DUNCAN. Well, individually, perhaps not; only this, if it might be so-called, more constant employment. It has helped to cheapen the finished product, and the finished product has been produced more perfectly, which has given them additional employment; but so far as the physical application of the machine to the man is concerned, and outside of the additional employment that he may have had, it has had the very opposite effect; it has been very harmful to his health.

Quite a number of years ago, up to 1890, perhaps, the deaths from tuberculosis, especially in the throats and lungs of the workmen, were from 30 to 40 to 45 per cent. As it came along, now it is nearer to 85; and that is attributed largely to the machines because of the increased amount of dust which permeates the atmosphere; and the man has difficulty in getting away from it; and the men who are strong physically otherwise and able to throw off consumption do it and live long and well; those who are not, or who are careless in their living and are not exactly circumspect, the germ gets hold of them. The men in my trade who die from consumption usually die from 25 to 40 or 42.

The ACTING CHAIRMAN. What I want to get at briefly is this: I do not want to take up much of your time; but it is more or less the subject of grievance, is it not, on the part of the workmen that, on the introduction of machinery, he has not received the benefit, or as much of the benefit, as he thinks he is entitled to?

Mr. DUNCAN. Yes.

The ACTING CHAIRMAN. That is, he thinks he ought to have shared in the benefits, and not had so much of it, or perhaps he might say all of it, go to the employer?

Mr. DUNCAN. He does not. We do not claim all of it goes to the employer.

The ACTING CHAIRMAN. Have you had a bigger share? There are three sharing in the benefit, of course—the employer, the worker, and the public.

Mr. DUNCAN. Yes.

The ACTING CHAIRMAN. What I want to get at very briefly is this: Do you think, speaking for the workman in your industry, that he has had as big a share as he ought to have had?

Mr. DUNCAN. No; perhaps not; but the dear public has had the most of it. The competition between the employers for the work reduces the advantage that he might individually get; but I do not think the man that is running the machine, or the contractor, has got the advantage this change has brought about, but the public has got it by reduced cost.

The ACTING CHAIRMAN. There is a remedy for that; is it in organization on both sides—organization on the part of the employer and organization on the part of the employee?

Mr. DUNCAN. That might be helpful; but, of course, if that were carried to its conclusion it would like a conspiracy between the two of them to fleece

the public to that extent; but in the stone industry, at least, we have not, either in the office or in the stone shop, we have not been able to get up such a combination.

The ACTING CHAIRMAN. I do not want you to understand that I meant a combination. I meant that perhaps it might be required in every trade, such a commission, theoretically, at least, as this—a commission that represents all three parties in interest; but even that sort of thing can not be obtained unless you have organization.

Mr. DUNCAN. That is right.

The ACTING CHAIRMAN. One of the things that you gain by collective bargaining is to protect those who are represented?

Mr. DUNCAN. Yes.

The ACTING CHAIRMAN. Now, if that is true about the introduction of machinery, is it not also true in regard to the introduction of methods—improved methods?

Mr. DUNCAN. I don't think so. Among the skilled trades I have never seen anything done to prevent or to create the impression in the minds of men that improved machinery or improved opportunities, like improved management, should be considered detrimental to the worker, or that he did not get out of it what he thought he ought to have. It is true that the man behind the hammer thinks he is not well enough compensated. That is part of his nature, too; and he would not be much of a human being if he didn't think so; and I do not think there are many reasoning beings that think they are getting enough.

The ACTING CHAIRMAN. We are all trying to get more; we are all trying to better ourselves, aren't we?

Mr. DUNCAN. Yes.

The ACTING CHAIRMAN. Do I get the impression from you that, while you think there has been in the past, as is proved, and that there will be in the future, improved machinery, that there is room for any improvement in methods?

Mr. DUNCAN. Oh, yes; there is room for improved methods all the time. The difficulty that we have in getting into the minds of the scientific management is this: They conclude that because we can not see the thing through their eyes, therefore we are wrong and that there is no advancement, and we stand for no advancement because we do not accept their theories. We say, for instance, that in the general concept of commerce the advantages they claim are scarcely visible, whereas in commerce the advantages of improved management and improved skill, and all that, is in evidence in every walk of life and in every industry and every phase of industry.

The ACTING CHAIRMAN. Well, let us forget them for a moment. We have gotten to the point where we both agree that there has been in the past, and will be in the future, improvement in machinery, and that there has been in the past and will be in the future improvement in methods.

Mr. DUNCAN. Yes.

The ACTING CHAIRMAN. Now, you say that these improvements in machinery have come sometimes sort of out of a clear sky and sometimes they have come by observation and by study. A man has applied the experience of years to a problem and he has finally worked out a better solution than anybody else ever did before.

Mr. DUNCAN. Yes.

The ACTING CHAIRMAN. Now, can you not conceive of that same thing being true of methods?

Mr. DUNCAN. Yes; absolutely so.

The ACTING CHAIRMAN. Well, then, what you really fear is that somebody will come along who does not really know the subject and will try to apply methods that will be unfair; is not that what you really fear?

Mr. DUNCAN. That is one of them; yes.

The ACTING CHAIRMAN. What are the others?

Mr. DUNCAN. One of the fears that I tried to exemplify before. For instance, you say to eliminate the other party. It is difficult for me to eliminate him from the discussion, because he is there.

The ACTING CHAIRMAN. I did not say to eliminate him; I say forget him.

Mr. DUNCAN. Well, it is cutting off the different letters of the word "habit"; there is always some of it left. The methods that you speak of—if you admit the methods that we follow at the present time in a practical manner, by which the additional advantages have been gained, then you are referring to some additional methods than those you originally referred to when you referred to methods, because there are any amount of methods now in use in every industry.

The ACTING CHAIRMAN. And you want to cut them out without adding any?

Mr. DUNCAN. No. One of the principal things that a workman objects to in this is a man standing over him, in theory or otherwise, directing this, that, and the other thing to be done, evidently almost entirely eliminating his individuality, so that his mechanical ability and his skill and his brain training are not as much represented in his work as following a routine laid down by a speeding boss. That is what hurts the man more than anything I know, and it would take all the ambition out of him; it would leave his mind, if it were followed up, not in a position to conceive the advantages or put him in a position where he should look for them and take advantage of them, but should rely on something foreign and outside of his individuality and mentality, and what would be gained in one way would be more than lost in the other.

The ACTING CHAIRMAN. Leaving that for a moment, do you still use in the granite districts the methods, that I know were used until recently, of splitting up a big piece of granite with wooden blocks and a series of holes and wetting those blocks and letting the swelling of the wood split the piece?

Mr. DUNCAN. No.

The ACTING CHAIRMAN. That has been abandoned?

Mr. DUNCAN. Yes; long ago; perhaps about a hundred years ago.

The ACTING CHAIRMAN. Then, you haven't got the same idea that I have, because when I was a schoolboy it was still in use, and I can not date back that far.

Mr. DUNCAN. I would like to shake hands with you over that. I want to live as long as I can, and your age encourages me.

The ACTING CHAIRMAN. Perhaps you misunderstood me.

Mr. DUNCAN. No; I did not. Occasionally that might have been done, and in your time, but it was a relic in my own—a relic of the past. They passed from using wooden wedges to iron wedges, and occasionally after they had abandoned the wooden wedge they would sometimes use it where they wanted to split a stone of a certain width; if it were 18 inches, and they wanted two stones of 8½ apiece, or something like that, and with the metal wedges that they used they would get a rough break, because it would break more fast. With the wooden wedges you speak of and this swelling there was always a considerable wait in the granite business, even at that. They used to wet them at night and let them rest over night. The way we need granite nowadays, because of the scientific management of the machine, we need to split a stone in 15 minutes, and we can not wait until next day. They drifted from the wooden wedges to the metal wedge, and later than that, about 30 years ago, they drifted from that to what is called in the trade "plug and feather," "shins and wedges"; there are different names for it. It is a small wedge that is put in and a man with a small drill—about half an inch or five-eighths of an inch bit—drills a line of holes and puts in these wedges, and in 10 or 15 minutes he would have split a piece of stone that would have taken a day and a night with the wooden wedge.

Again, when they need close sizes they will put a stone under a saw, and with that saw—we are sawing now as much as 38 inches in 8 hours, whereas when I was a boy and in the trade, if we sawed an inch or an inch and a half in a week we thought we were doing well.

So much for the scientific management of the man behind the hammer. That thing has been going on all the time. They take a block the size of these tables and they put two or three saws in it—or six of them, according to the size—and put a machine to work on them, and in a short time they have a carload of slabs, whereas with the wooden wedges and with the others it would have taken a long time. They have not been split, as I stated, with wooden wedges for a long time.

The ACTING CHAIRMAN. What I referred to was getting big blocks—when they wanted a big column, or something like that.

Mr. DUNCAN. When they wanted to have a very fine break they never did that, except where the slow process will take effect rather than the quick, because a stone would wobble and they would lose width.

The ACTING CHAIRMAN. You spoke of the hammer and chisel, and all that; are they the same form and size that they were using, say, 25 or 30 years ago?

Mr. DUNCAN. Well, because there are saws giving a better shape. At the time you mentioned, the cutter, his hand hammer is not as heavy; but the difference is not so much in that, perhaps a quarter of a pound, 3½ pounds where it used to be 4, and the chisels he uses by hand are about the same, and most of the chisels he uses now are in machines; most of them are in machines or

pneumatic tools, so-called, are doing most of the work that way; they do not do a great deal of it—some portion of it, perhaps—but in chiseling they do the most of it.

Commissioner GARRETSON. I would like to ask a question or two on one subject that was brought out by Mr. Weinstock, showing another phase of what application or management might do. Following up this, the product will be represented by a hundred?

Mr. DUNCAN. Yes.

Commissioner GARRETSON. And for a similar purpose we will say that the number producing that product is 100?

Mr. DUNCAN. Yes.

Commissioner GARRETSON. And that the number of consumers is represented by 100?

Mr. DUNCAN. Yes.

Commissioner GARRETSON. We will just draw a fence around the country, and let those three numbers represent those three factors. If, under efficiency management, as is claimed, the individual product is increased to a degree that eliminates one-fifth of the workers, or 20, does not that create a corresponding reduction in the market for that product, or does it?

Mr. DUNCAN. It would depend, of course, upon the consumption of the public.

Commissioner GARRETSON. If the public are the consumers, these workers are part of the same public.

Mr. DUNCAN. Yes; then it would be reduced.

Commissioner GARRETSON. Then what would follow? Would production be limited because consumption had been limited? They would have to find a new market otherwise, wouldn't they?

Mr. DUNCAN. They would.

Commissioner GARRETSON. Would not a further reduction of the number of producers again limit the market? Does it make any difference how much you cheapen the market price of a thing if the producer has no money? Would that condition be fairly economically good, then, if it worked that result? Would it or would it not?

Mr. DUNCAN. The advantage we contend for in your question is that unless there is an advantage to the consuming number, the economic claim is an error?

Commissioner GARRETSON. Very well; I think that is all.

The ACTING CHAIRMAN. Mr. Thompson, will you call your next witness?

Mr. THOMPSON. I should like to ask the commission if there is any definite hour set for Mr. Brandeis?

The ACTING CHAIRMAN. Two o'clock is set.

Mr. THOMPSON. Then we will begin with this witness, and split the time if we are not finished.

TESTIMONY OF MR. JOHN GOLDEN.

Mr. THOMPSON. Your residence, Mr. Golden?

Mr. GOLDEN. Fall River, Mass.

Mr. THOMPSON. Your occupation?

Mr. GOLDEN. General president of the United Textile Workers of America.

Mr. THOMPSON. How long have you been such president?

Mr. GOLDEN. Since 1903.

Mr. THOMPSON. Will you tell the commission what workers that includes, or organization?

Mr. GOLDEN. The manufacturing of all classes of textile fabrics, cotton, wool, silk, flax, and jute.

Mr. THOMPSON. Where are they mostly employed; in factories and shops?

Mr. GOLDEN. All in factories.

Mr. THOMPSON. In that line of industry there is considerable use of machinery, is there not?

Mr. GOLDEN. Very little handwork at all now.

Mr. THOMPSON. In that industry have you had any chance to study the operation of the so-called scientific management systems or efficiency systems?

Mr. GOLDEN. Yes.

Mr. THOMPSON. You have?

Mr. GOLDEN. A little; not to a very large extent yet.

Mr. THOMPSON. Have you made a study of those systems outside of your own industry?

Mr. GOLDEN. More particularly in my own industry.

Mr. THOMPSON. Tell us in your own language what you have to say with reference to those systems, as affecting the workers in your own industry.

Mr. GOLDEN. Well, gentlemen, I want to say in the first place that I have not had as much of this to meet as some of the other industries. Take the machinists' industry, etc., but the last two years it has become more pronounced, and in the last few months we have had more of it, until it has come to a point now where the moment we get a complaint in about increasing the work of the operatives we do not have to jump to a conclusion. In about nine cases out of every ten, we find it comes about through the introduction of what is known in our trade as a systematizer, a man who comes in there and begins to introduce new methods, and in a very short time, as they have done in a great many instances, he succeeds in bringing the mill on strike. We had a number of instances in the last few months.

Mr. THOMPSON. Will you give a typical case of what the systematizer did, and how that led, if it did lead, to trouble?

Mr. GOLDEN. Well, we had a case within the last few weeks. I will give you this because it will take the shortest time to give it. I understand that if I am kept on the grill as long as my friend Duncan, my testimony will be broken into by my friend Mr. Brandeis—I have no objection to having that done—but I have one case which will take some little time to explain, but will probably serve to answer some of the questions that will be answered later in regard to some phases of this subject.

We had a case of a mill in Massachusetts, and I want to say that I prefer, in giving my testimony, to give some specific cases if I am allowed to, and I want to ask the privilege of giving the facts of those cases and leave the names in the hands of the commission, for obvious reasons.

Mr. THOMPSON. You may do that. I might say to you that you may take your own manner of stating what you have to state. We have permitted the experts to do that, and in fairness, will do the same thing with you.

Mr. GOLDEN. We had a case only about six weeks ago in a large manufacturing city, where scientific management had been unknown up to that time. It was in a department of a large mill where nothing but women were employed, and things had gone along mightily peacefully for many years.

We were notified at our headquarters that a strike had taken place in this particular mill, so I sent a representative from headquarters to investigate, and he came back and said "scientific management." So I made a personal investigation, and here is what happened:

A so-called systematizer had arrived and began to look around for the best field to begin operations in. I suppose, according to his theoretical judgment, that was the best place, and he started in. This mill was an old mill and had machinery a little mite antiquated. Knowing that that condition existed, the superintendent of the mill, who had risen up from a sweeper boy and spent 40 years in the mill, had that machinery running at a speed which, according to his experienced mind, was as fast a speed as the machinery would stand for. We have a list—there is an indicator on those machines that governs the wages; they are paid piecework, and they were paid so much per hank, which is 840 yards in length. We use those terms in order to bring down the volume of figures.

Knowing that this machinery could not be speeded up any more, these people were paid a few cents extra, or a few mills per hank more than the agreement called for—more than would prevail in the newer and more modern mills. The systematizer came in and immediately discovered this, and said, "Oh, we will change that." Well, it only meant about 30 cents per week on the change, but to a woman earning \$10 a week 30 cents is a lot of money.

Mr. THOMPSON. He cut wages immediately to the extent of 30 cents?

Mr. GOLDEN. Yes; he cut them in this way, though: He said, "We will put these on the standard prices, but this machine is not running so fast as the machine across the street," and consequently he knew more than the man who had been in charge of that machine for 30 years, and immediately the speed of the machine was increased up to the standard rate. The girls did not say anything; they do not go much into details in regard to the size of the gears put onto the machines, but they were told that they were on the standard rate of wages, and this change was taking place, etc., and that extra 30 cents had

been taken off, but on account of the extra speed of the machine they would earn from \$1 to \$1.50 more.

Well, the girls tried it out, and the first week they were about 60 cents short of their average weekly earnings, and there was a lot of unrest started among them. But he said, "That's all right; you have not got used to this, but another week will show it up."

Well, another week went on, and, if anything, it was a little worse, because the girls had got excited and were not working under their normal condition of mind, and at the end of the second week things were worse than they were at the end of the first week. They went to the superintendent and made their complaint, and the superintendent said, "Well, you have got to go right on; I can not change it." They did not know all the particulars then, but the fact of the matter was that the thing had been put in the hands of a so-called expert. The women talked it over among themselves, and they got so excited that they struck work.

I went down and I tried to reason with the superintendent. I did not know what part he was playing in this, or anything; and he said, "Well, John, I can not help it; it is there, and the gentleman claims that these machines ought to run as fast as the others," etc. I said, "Well, you know they have not for many years," and he said, "No; I know that," but he said, "He is not going to give anything away again, and they have got to run as fast as the others."

Then it was stated that they were going to make some other changes; that they were going to give them help in carrying the production away and bringing the raw material to them. Well, that was all right; but, as a matter of fact, on the excess speed under which they were working they were turning off a less production, so that they neither had time, as they had before, to fetch their raw material or carry their production away, simply because the machine was breaking the threads on account of its being oversped, and the promise of assistance in bringing the raw material and the promise given them of assistance in carrying the finished product away, as far as that particular machine was concerned, had no bearing on the case, for the simple reason that they were not using as much and that the breakage in the thread was creating work there which would not give them any time to do either one job or the other, and at the end of the week, of course, with the breakage of the thread, their envelopes were, as I say, 30 cents less, and as high as 60 cents.

I thought there was something underneath this and advised the girls to go back to work. He said he would make up their pay; he said he would give them the pay they had formerly received, average wages, if they would go back under the new system. The girls went back. The speed was left on there, and at the end of two weeks the girls struck again. The members of the union told me straight, "John, we will not work under those conditions. We are overworked. They fixed the wages all right, but still we know now what is happening. They have speeded up that machine to the point where it will not run right, it will not carry the thread right, and we are piecing up threads all day, and we are earning in production less. We are getting the same kind of wages, and we are doing more work, and we refuse to do it any more." A strike ensued, the result of which was we cut out the system, and as the result of the difference of opinion, I suppose, between the superintendent and the proprietors, and the troubles they had had there, the superintendent also was either fired for not being able to handle these people and continue the system, or otherwise he got so sick himself he gave up the job. As a matter of fact, he is not there.

Something was said here about the stop watch. The most ridiculous thing that I have seen has been the systematizer sitting in front of a machine, with a man or woman working on it, and timing that machine when it is already running at the maximum guaranteed by the maker of the machine. Then we have had cases where, in spite of that guaranteed maximum speed, which the machine very seldom attains, because they figure on the very highest basis to sell their machines, where the systematizer has gone in there and increased that machine over the guaranteed speed given by the maker.

Our experience has also been this: I know the same thing would prevail if I had to go under the ordeal, even with all my experience on the outside. I do not care who the man or woman or boy or girl may be, where somebody is standing over them with a stop watch they are not going to give the same results as if the man with the stop watch was down in the cellar and they were working in the attic.

Almost in every case where it has been attempted in the textile industry, it has always been upon the basic principle of increasing the speed of the machinery.

Mr. THOMPSON. Mr. Golden, referring to the question of setting the time standards by a stop watch, and assuming that it is necessary, or, rather, that it is a good thing, to make a time study of a piece of work, and that a certain operator is selected for that purpose who is willing to be taken as the time study, then certainly he can not feel humiliated or insulted if he is willing to accept the time study, can he?

Mr. GOLDEN. No; he does not feel humiliated, but when he knows he is going under that ordeal, our experience has been that he is not giving the results, he is nervous because somebody is watching him.

Mr. THOMPSON. But assuming that the time study is made of some length of time so it gives him opportunity to operate carefully and properly, and he is perfectly willing to do it and is given perfect freedom to say no without any penalty, and that no compulsion is used, then certainly there can be no objection so far as the single operator is concerned, can there?

Mr. GOLDEN. Oh, no; not at all.

Mr. THOMPSON. If, as a matter of fact, it was a good thing to make a time study—assuming that as the fact—to arrive at a given task, and the operator was perfectly willing to do it and pleased to do it as a matter of fact also, then your objection to the time study, as you have mentioned it, would of course pass away. In other words, your objection to the time study is based upon the assumption that on the part of the worker he feels humiliated, and, in the second place, that he is put under a nervous strain which he feels is unfair. That is your objection?

Mr. GOLDEN. Yes. He always has this in mind, and it is natural that there is an assumption there that he and the rest of them are not doing their best.

Mr. THOMPSON. But if he could be disabused of that and the rest could be disabused of that idea, and if this were simply one of the things being done for the purpose of trying to see if, by the use of systematic study from point to point of the industry, not any single man's work, but on the various works, and there was no intimation at all that that record was being kept to show that the worker was being unfair or was soldiering, but in so far as the work undertaken was concerned that the management was itself subject to some criticism in the routing and in its part of the work; in other words, if the worker felt those things that they were studying the shop, not only as concerned the worker, but as concerns the proprietor, by an impartial man without criticism of either, but to find the best method there could then be no objection to it, could there?

Mr. GOLDEN. I do not think there would be.

Mr. THOMPSON. Where there is a setting of time standards, or the setting of a day's wage, like a day wage, from your experience as a union leader do you believe there is the opportunity for the exercise of this collective bargaining and trade agreement?

Mr. GOLDEN. Yes.

Mr. THOMPSON. Do you feel a great deal of the present opposition that exists among the workers with reference to these efficiency or systematizing people—that if its operation were subject to the worker, or, rather, that in guiding him the worker has an equal voice with the proprietor, then a great deal of the objection would pass away, would it not?

Mr. GOLDEN. Undoubtedly. I might add to that further by saying this: That in many factories of our textile industry, in which some of them are highly skilled, you can put 25 people in one room, all running the same kind of a machine, and you will find no two people that run those machines exactly alike. They will get somewhere near the same total in production. In fact, they have got to; but they get at it by a little different method. For instance, take the trade that I followed as a mule spinner—that is, spinning fine yarn. You would find one man always working, always seemingly in a hurry, and also pushing his machine a little. The next man to him would not walk so fast. When I say "walk" I mean that at my trade as a mule spinner a man walks an average of from 30 to 35 miles a day in his bare feet, following the two machines that travel back and forth. They travel 64 inches back and forth from four to four and a half times per minute. He has to work in his bare feet, or he would fall over the machine while it was in motion. He can not work with slippers or anything on the soles of his feet. One man would always be in a hurry. The next man to him would be taking it a good deal easier. If you should attempt to change that man's method of work you would have to change his

whole disposition; naturally so. Probably he had been that way from a boy, and he was then a man 40 years of age. And yet he gets the same results, or gets the same number of pounds off at the end of the week; but he works differently because he is temperamentally different. As was said here a little while ago, I do not know whether the experts on scientific management are claiming that they can change the temperamental nature of mankind, but they would have to do it in those cases. What I say of the mule spinner prevails more or less with both the men and women employed throughout the industry.

Mr. THOMPSON. Then, in your opinion, so far as the spinning industry is concerned, considering the conditions and the machines used, there is little opportunity for the introduction—at least, so far as the operator is concerned—of any new methods of operation?

Mr. GOLDEN. I do not see where there is any.

Mr. THOMPSON. But it still might apply to other industries?

Mr. GOLDEN. Yes.

Mr. THOMPSON. To which it might be of advantage?

Mr. GOLDEN. I should imagine it would apply more to the man working by hand.

Mr. MANLY. Mr. Golden, in the case of mule spinning, how are the piece rates determined?

Mr. GOLDEN. By the length of yarns you spin.

Mr. MANLY. Are they determined by the employer or by agreement between your organization and the employer?

Mr. GOLDEN. In the mule spinning trade it has been organized since away back in 1858. It is the best-organized branch of the textile industry; that is, in cotton or worsted. They are determined by a joint agreement. We drew up a list in 1886, the last list we drew up, and from time to time when there is any little dispute we get together, and it is determined by joint verbal agreement. We do not go into any written agreements, because we get so close together that we can agree. Of course, we have a fellow that tries to pay a little less once in a while, but we attend to him.

Mr. MANLY. One of your representatives, in that case, goes to the mill and takes the matter up directly with the employer and, if possible, they thrash the thing out?

Mr. GOLDEN. In the larger cities—and in the smaller places they are guided by them—like New Bedford or Fall River or Lawrence or Lowell we deal with the employers' association. They appoint a committee, and we appoint a committee, of five or three. Sometimes the heads of the local unions settle the thing up. They are expert at the business. But all those lists have been drawn up and started away back in 1886 between the two associations, and everything is based on those.

Mr. MANLY. Are those rates that exist in the list of 1886 equally advantageous? Are there fat and lean rates or pieces that a man would rather work on than others?

Mr. GOLDEN. No. The principle of the list is this: You have the very coarse yarn. We call them by numbers, No. 2's and 4's and 6's, and then they go up perhaps to 250, which is the very finest yarn. The man who works on the finer yarn does not work quite so hard as the man on the coarser yarns, because the man on the coarser yarns walks twice the distance. We found there was a dispute for several years, and that this took more skill on the finer grades, and another argument was that "this man works harder and travels more." We have had our troubles, but for many years now we have based those lists in the cases, etc., on making it as nearly uniform as possible. Some of the men on the coarser grades never would make a real good fine spinner. But it is so balanced up between the skilled worker and the distance walked, etc., that we finally agreed the most satisfactory way was to base the wages as nearly as possible upon a uniform basis in accordance with the length of the machine he ran. That meant the number of threads he had to attend to.

Mr. MANLY. That has been worked out on the basis of the general experience of the organized men and the employers simply by giving and taking, and finally getting down to a basic principle?

Mr. GOLDEN. Yes; we have sat like we are here for a whole day and thrashed the thing out and finally come to an agreement.

Mr. MANLY. In thrashing it out, was it your general experience or did you have accurate data of the output per day?

Mr. GOLDEN. Oh, yes; we took the average production of the spinners.

Mr. MANLY. On the different sizes of yarn?

Mr. GOLDEN. The different sizes of yarn; yes.

Mr. MANLY. And worked out a differential based on that?

Mr. GOLDEN. Yes.

Mr. MANLY. So, as a matter of fact, you arrived at a pretty definite series of standards?

Mr. GOLDEN. Yes. I might add also that what you say of the mule spinner now largely obtains in the other departments, because they took different kinds of frames—drawing frames and the fine speeder—and they have their indicators on there and those indicate the number of yards turned off by the operative.

Mr. MANLY. That indicator is making more or less of a time study all the time?

Mr. GOLDEN. Yes; it simply indicated the speed of the machine.

Mr. MANLY. That with the deduction of time when the machine is not running would show the total number of units?

Mr. GOLDEN. Yes. They allow us so much percentage off for what we call "doffing"—taking the material off, etc.—and some of the methods introduced in there in some instances by the systematizer have been to try to adopt some different methods in the system of doffing. We allow in some instances 5 per cent for time stopped, and some 3 per cent. They have tried to change the method of doffing to reduce that 5 per cent.

Mr. MANLY. But the general result of the negotiations over a long period of years of the union and the manufacturers has been to get to pretty definite standards for your work?

Mr. GOLDEN. Yes.

Mr. MANLY. As to what constitutes a fair price for the basic yarn and what is a proper differential?

Mr. GOLDEN. We have very few disputes in regard to that, simply because when one does arise we can point to illustrations.

Mr. MANLY. Are you familiar with the arrangements in the cotton textile industry of Lancashire, England?

Mr. GOLDEN. Yes; as a young man I worked there.

Mr. MANLY. Do you know the way in which the readjustment of piece rates there is carried out? After the basic rates are determined and increases are determined by joint conference, then the readjustment, the in-between conferences, are practically all carried out by two experts, one from each side.

Mr. GOLDEN. Yes.

Mr. MANLY. Those experts are selected, are they, by a very careful test?

Mr. GOLDEN. The usual thing is that they have a very much more advanced system there than we have. Take the more technical schools, or what we call textile schools here—the unions, on the one hand, make it their business to develop some of their own men in the expert line, and the employers' association do the same thing; so when it is all boiled down the experts are really the expert representative of one side and the expert representative of the other side.

Mr. MANLY. And they thrash out practically all questions that come up with regard to the speeding of the machines, and so on?

Mr. GOLDEN. Yes; and they are very often in joint conference with the experts there.

Mr. MANLY. As a matter of fact, the union representative has to pass what amounts to a civil-service examination, does he not?

Mr. GOLDEN. Yes.

Mr. MANLY. He is put through a very rigid test?

Mr. GOLDEN. Yes; he has to know his business.

Mr. MANLY. From start to finish?

Mr. GOLDEN. Oh, yes.

The ACTING CHAIRMAN. The commission will recess now until 2 o'clock. Mr. Golden, will you be able to be here this afternoon after we conclude with Mr. Brandeis?

Mr. GOLDEN. Yes.

(Thereupon, at 1 o'clock p. m., the commission took a recess until 2 o'clock p. m.)

AFTER RECESS—2 O'CLOCK P. M.

The ACTING CHAIRMAN (Commissioner Delano). The meeting will please come to order. Mr. Thompson, will you please call your witness?

TESTIMONY OF MR. LOUIS D. BRANDEIS.

Mr. THOMPSON. For the purpose of the record, but not for our information, will you please give your name and occupation?

Mr. BRANDEIS. Louis D. Brandeis, Boston, counselor at law.

Mr. THOMPSON. The commission has for the subject of its public hearings to-day the question of efficiency systems, scientific management, and labor. We should be pleased to hear from you on that subject.

Mr. BRANDEIS. Mr. Chairman, my special interest in this subject arises from a conviction that in the first place the workmen, and in the second the members of the community generally, can attain the ideals of our American democracy only through an immediate increase and perhaps a constant increase in the productivity of man. We hear a great deal about the inequality in the distribution of wealth and in the proceeds and the profits derived from industry. Such inequality exists; and it is clear that, even if there were a perfectly fair distribution, our ideals could not be attained unless we succeeded in greatly increasing the productivity of man; and to my mind the greatest objection from one standpoint to the inequality to-day is that it tends to discourage effort and therefore suppresses productivity. The progress that we have made in improving the condition of the workmen during the last century, and particularly during the last 50 years, has been largely due to the fact that the intervention or the introduction of machinery has gone so far in increasing the productivity of the individual man. The misfortune in connection with the introduction of machinery and the revolution that came with it is, or was, that when that introduction of a method of increasing the productivity of man was made labor did not get the share to which it was entitled. With the advent of the new science of management has come the next great opportunity for increasing labor's share in production; and it seems to me, therefore, of the utmost importance not only that the science should be developed and should be applied as far as possible, but that it should be applied in cooperation with the representatives of organized labor in order that labor may now in this new movement get its proper share.

Now, I take it that the whole of this science of management is nothing more than an organized effort, pursued intensively, to eliminate waste. The expert tells us how this may be done. The experts make the individual detailed study, which is an essential of the elimination of waste; but, after all, the fundamental problems are social and industrial. It is, in the process of eliminating waste and increasing the productivity of man to adopt those methods which will insure the social and industrial essentials, fairness in the development, fairness in the distribution of the profits, and that encouragement to the workman, which can not come without fairness.

Now, I take it that in order to accomplish this result it is absolutely essential that the unions should be represented in the process. In the first place, the question comes up—must come up—in applying the results of scientific management, in determining the very basis and standard on which any system is to rest, as to what is the proper time in which a certain operation shall be performed. Now, that subject of what is the proper time is a question in which representatives of the workers distinctly ought to have a voice. No matter how far you may go into scientific investigation, there must always come in the question of the human element, as to how hard a man ought to work, how fast he ought to work, and how fast he can work consistently with health. Now, in that question there ought to be an opportunity for the full protection of the men who work, and that properly can be done only through representatives of organized labor.

In the next place—the first bears, of course, upon the adopting of what is the standard—but the next thing comes in applying some matter, some incentive, as you may call it, or a reward of a fair division of the profits resulting from the introduction of the new system. Now, what is fair? What is the amount which ought to go to labor is a subject which can not be determined by any scientific investigation. It is a matter for the exercise of judgment, judgment as to what not only shall be the best and the proper incentive but judgment as to what is just, what is consistent with the interests of the community, all of the conditions which surround introduction, and all of the conditions which concern the pursuit of business under these new conditions, just as those which concern the conduct of business under the old conditions, demand that labor should have its representatives in the solution of these problems. When labor

is given such a representation I am unable to find anything in scientific management which is not strictly in accord with the interests of labor, because it is nothing more than fair, through the application of these methods which have been pursued in other branches of science, to find out the best and the most effective way of accomplishing the result. It is not making men work harder. The very effort of it is to make them work less hard, to accomplish more by what they do, and eliminate all unnecessary motions; to educate them so as to make them most effective; to give special effort and special assistance to those who at the time of the commencement of their work are mostly in need of assistance because they are least competent.

Now, the advance in the condition of the workingman is attained by each and every one of the purposes which scientific management and which the apostles of scientific management set before themselves. Whatever there is in the application of the principles of scientific management to a business that may expose the workingman to danger, that is to be guarded against and will be guarded against by a proper representation.

So that as I view the problem it is only one of making the employer recognize the necessity of the participation of representatives of labor in the introduction and carrying forward of the work, and on the other hand bringing to the workingman and the representatives of organized labor the recognition of the fact that there is nothing in scientific management itself which is inimical to the interests of the workingman, but merely perhaps the practices of certain individuals, of certain employers, or concerns who have been engaged in it.

I have felt that this presented a very great opportunity for organized labor. It seemed to me absolutely clear, as scientific management rested upon fundamental principles of advance in man's productivity, of determining what the best way was of doing a thing instead of the poor way, of a complete co-ordination and organization of the various departments of business, that the introduction of scientific management in our businesses was certain to come; that those who oppose introduction altogether were undertaking a perfectly impossible task; and that if organized labor took the position of absolute opposition, instead of taking the position of insisting upon their proper part in the introduction of this system, and the conduct of the business under it, organized labor would lose its greatest opportunity and would be defeating the very purpose for which it exists.

You have heard, Mr. Chairman, so much on this subject during the week, and so much from others who know far more about it than I, that I doubt whether there is anything I can say, unless it be to answer some of the questions or attempt to answer some of the questions which may have arisen in your minds in the course of the discussion.

Mr. THOMPSON. Mr. Brandeis, I would like to ask whether in your study of this subject you have placed or fixed any time at which labor should cooperate with the employer as to the setting of a time standard and the initiation of a standard?

Mr. BRANDEIS. Yes—all the time.

Mr. THOMPSON. It begins at the beginning?

Mr. BRANDEIS. It begins at the very beginning. It seems to me it should begin at the time when the plans are being made to introduce the system.

Mr. THOMPSON. Some of the advocates of scientific management, Mr. Brandeis, who have appeared here as witnesses before the commission, while agreeing to the proposition that it would perhaps be beneficial for labor to cooperate or have a voice in cooperating with the employer in the running of the system, felt that at the introduction there should be no cooperation; that there is so much difficulty in the selection of the system and in the installation of it, that the added element of labor would make it impossible. Do you so conceive it?

Mr. BRANDEIS. I should say quite the contrary. It seems to me that the elements of difficulty in introduction are largely due to the fact that there is hostility to the introduction, and that if organized labor or the representatives of labor should welcome and cooperate in the introduction a greater part of these difficulties would be removed. Of course, there are a good many difficulties that must stop—I mean matters that involve a very great study—difficult in the sense of problems to be solved. They will exist under any circumstances—the problems of finding out how you want to do a thing; when you know how you ought to do it, how you ought to bring a man to do it the way he ought to do it. Those are problems which are inherent and have to be worked out and require most intensive application and patience. But the whole

of the work, it seems to me, would be greatly aided by a spirit of helpfulness instead of the reverse.

Mr. THOMPSON. Mr. Brandeis, some of the representatives of organized labor who have appeared here to testify have concurred in the idea of scientific management which you have elaborated. That is to say, if by studies and by analysis and selection better methods for doing the work could be brought about which would be beneficial to the community and to the worker as well as to the employer, it was a good thing. But they have objected to the stop-watch method of making time studies. People who have represented systems, such as Mr. Taylor and others, have said that the stop-watch method of making time studies is one of the first laws of scientific management. In your opinion, what reasonable objection can there be to the introduction of the stop-watch method of making time studies?

Mr. BRANDEIS. It seems to me there can be no objection except the one as to the way in which it is introduced. There is a question of tact, there is a question of consideration, there is a question of the recognition of prejudice and feelings and of the possibility of misunderstanding which a man of tact and a man accustomed to dealing with labor or to dealing with men generally must recognize. But if it is done in the right way, the stop watch can not, it seems to me, be objected to by labor, because it is the greatest possible protection to labor. What labor has suffered from in the past and is constantly suffering from now is the ignoring of facts, either because they are not known or because they are known to some persons and not to labor. There is nothing, as I view it, in the situation, the whole social industrial structure, that labor wants so much as knowledge. It wants not only to know itself but it wants others to know it; and any means that may be adopted, whether it be the stop watch or the photograph or any other means, that could absolutely establish the fact as to what is being done, how long it takes to do it, what the unit is of doing the particular thing—all those are in the interest of labor, because they are in the interest of truth. Of course, there is a question, as I have said, of tact in dealing with the subject.

Mr. THOMPSON. In your study of this subject have you considered ways and means? In other words, have you considered the kind of machinery that might be used in the cooperation of the employer and employee in putting into operation their joint cooperation in the introduction of this system?

Mr. BRANDEIS. Not machinery—and I doubt very much whether there is any machinery, except the tactful and sympathetic man, some one who realizes, in the first place, that the greatest gain we are to get from scientific management is advancing the interests of the workingman, and who, recognizing that as a fact, has the tact to bring the workingman and his employer together in the adoption of the means by which the various steps should be taken.

Mr. THOMPSON. Have you considered whether or not it is feasible at the beginning for a representative of the workers and the firm to have a joint voice in the selection of the expert who shall install a system, or would that be impracticable?

Mr. BRANDEIS. I have thought of that, and I see no difficulty whatever in the adoption of that. We are fortunately getting to the point where the unions, as they are developing stability and strength, are recognizing that they, like other people, must employ experts. They are taking, consequently, in selecting for their important work men who are not members of their unions, just as employers must select professional men to perform particular duties. They have found in many instances that some men were available and were as loyal to their cause as anybody could possibly be to a cause. That is the situation which presents itself. The expert who is to be selected may be selected by the unions with quite as much intelligence and with quite as much certainty of loyal service as if it were by the employer; and there are very many relations in life where the selection, for instance, of an expert accountant is to be made by the various parties at interest, and where experts are constantly being employed by parties who have different interests to conserve by joint arrangements. I see no difficulty whatever in making that selection in such a case as this.

Mr. THOMPSON. In such a selection, Mr. Brandeis, of the kind of man you mention, a tactful, diplomatic man, he would then be in a sense the instrument or medium by which this principle of cooperation in scientific management might be brought about?

Mr. BRANDEIS. Certainly.

Mr. THOMPSON. As only a small portion of labor is organized, Mr. Brandeis, how would you protect, in the introduction of systems of scientific management, the unorganized workers?

Mr. BRANDEIS. You mean in a particular establishment?

Mr. THOMPSON. In a particular establishment or industry, or in general?

Mr. BRANDEIS. It seems to me that the extent and character of his protection would be precisely that which exists to-day. Organized labor is probably doing more, far more, to protect those who are not organized, than they are to protect their own members, and the problem would present itself in just the same way.

Mr. THOMPSON. I would draw this deduction from that answer, Mr. Brandeis, that perhaps from the best introduction of scientific management in a shop or factory, it really would require an organization of the workers in order that they might have a competent voice in the selection of the expert.

Mr. BRANDEIS. That seems to me to be absolutely so. I think it is perfectly possible and probable that scientific management has been introduced in so many shops where the workmen have been well treated, and certainly where their wages have been very largely increased by the process, but it is not safe, and as a broad social proposition we ought to insist upon the other thing. It is contrary to all our ideas of democracy, and particularly of industrial democracy.

Mr. THOMPSON. Then you would agree, Mr. Brandeis, with the witnesses who appeared before this commission last week on the subject of collective bargaining and conciliation and arbitration, that the best results are obtained in the industrial world where there is good organization, thorough organization, on both the part of labor and the part of capital?

Mr. BRANDEIS. I have no question of that, and I think it is not only that, but it is the only safe course to pursue.

Mr. THOMPSON. In your view, Mr. Brandeis, of scientific management of business, you do not take that to mean only such a system as could be carried out by a superman or man far above the normal?

Mr. BRANDEIS. Quite the contrary. To my mind one of the greatest advantages of the introduction of scientific management is to make the so-called incompetent man useful. The man who is extraordinary needs no help from anyone under any system. He advances—of course, not as far as he might. He might waste considerable of a great ability; but the man of great ability does not need any help from the community as such, or from a system as such.

Mr. THOMPSON. Then any system of scientific management which only contemplated that one man out of five would be able to carry it out would not be generally such a system as you would indorse?

Mr. BRANDEIS. One man out of five might be able to perform a particular work, or one man out of 10 or 20 a particular work, and there ought to be work for him to do, and work that he could do more effectively than he would ordinarily do it.

Of course, it is the essence of scientific management to pick your man for a particular work, just as important and essential as it is to pick your tool for a machine for a particular work—that is, to treat human beings as you treat a machine—intelligently—and not put a round man in a square hole.

But in the evidence which we have on the subject of scientific management, one of the interesting and hopeful things is that by which seemingly the most incompetent and most impossible persons were made by patient instruction to become effective workmen and aid themselves and industry as a whole.

Mr. THOMPSON. But, in your opinion, if there were any attempt in any system to develop it to the point where men were driven to an extreme, and the tendency was to see just how much efficiency you could get out of a man for a short term of years; if there was such a system, it would be rectified by the cooperation of labor and its suggestions?

Mr. BRANDEIS. Yes. The contrary, it seems to me, would be absolutely contrary to all principles of scientific management. It recognizes the conservation of man and it affords the very greatest incentive to the conservation of man, because it takes raw material and makes it a perfect and finished article.

It would be absolutely suicidal for any manager to develop his men and then kill them. That is the way you could take unskilled labor and kill it at the start, but under scientific management the manager has put an immense amount of money in his investment. It would tend also to the stabilizing of labor, because men want to keep their health when they have been trained; so all the fundamental ideas of scientific management are in accord with our social desires for

labor, but it needs a protection. Nobody ought to be absolute; everybody ought to be protected from arbitrariness and wrong decisions by the representations of others who are being affected.

Mr. THOMPSON. Then, in your opinion, any system of scientific management which looked just to the greatest amount of productivity, without respect to the effect of that upon the health and well-being of the worker, would miss one of the very largest parts in the real proper condition of scientific management?

Mr. BRANDEIS. It would not be scientific management.

Mr. THOMPSON. It would not be?

Mr. BRANDEIS. It would not be.

Mr. THOMPSON. That is all I care to ask this witness.

Mr. MANLY. You have said that the prosperity of society as well as of the workman was dependent on a great increase of productivity. Is it not a fact that at the present time, however, that not any of our industries are operated to their full capacity or even approximately to their full capacity throughout the year?

Mr. BRANDEIS. I think that is true, throughout the year, and probably at all times during the year.

Mr. MANLY. Probably at all times during the year. Not only for the necessity for repairs but through shutting down the plant from time to time?

Mr. BRANDEIS. Yes; and many other causes.

Mr. MANLY. In the case of the steel industry, for example, the capacity is approximately about 40,000,000 tons, and the largest output recorded to date is approximately 30,000,000 tons. We have there a reservoir of unused productive capacity. If the existing plant became more productive, has society any way to force it to produce to its full capacity? If we can double the capacity of individual plants, it would be possible to produce our 30,000,000 tons with half of the existing plants; would that be done, or would the manufacturer, out of the goodness of his heart, produce 60,000,000 tons a year by running to full capacity?

Mr. BRANDEIS. I should not rely upon the goodness of heart of anybody. I think the system ought to be developed on entirely different lines. Your question suggests one other thought, aside from the direct one that is involved in scientific management specifically, and that is the propriety of a demand for regular employment. It seems to me that the time has come when that should be one of the specific demands of society and of the labor unions, and that the conception of day labor is entirely unsocial and is entirely uneconomical; it is distinctly contrary to the whole conception of scientific management, because it involves such waste as you can find in any possible department of industry.

Mr. MANLY. But it is true, is it not, that society even now is not getting the benefit of the full productive capacity, either of the equipment or of the man?

Mr. BRANDEIS. Yes; but that is not because there is not a possibility of utilizing the full capacity. It seems to me that we are so far away in this country, and probably in any country, from satisfying the possible wants of the community, that there is no fear of overproduction in its proper sense. It all comes to the question of what people can afford to buy, and whether it be steel or whether it be many of the other things, if they could be produced in a way so that they themselves would thereafter be productive; that is, at less cost, that the demand would be there for them, and that there is practically no such thing as there not being potential demand enough for all that we can produce.

Mr. MANLY. I am afraid I haven't made my point clear, because it seems to me the theory is not one of overproduction in that case, in the steel industry; not the fear of the steel industry producing 60,000,000 tons after the capacity of each plant had been doubled, but that it will not produce 60,000,000 tons.

Mr. BRANDEIS. You mean that it will voluntarily restrict production?

Mr. MANLY. That it will voluntarily restrict production, as it is doing now.

Mr. BRANDEIS. Then the answer to that proposition is the one that I suggested before, that society and labor should demand continuity of employment, and when we once get to a point where workingmen are paid throughout the year, as the officers of a corporation are paid throughout the year, and the higher employees are paid throughout the year, everyone will recognize that a business can not be run profitably unless you keep it running, because if you have to pay, whether your men are working or not, your men will work.

It seems to me that industry has been allowed to develop chaotically, mainly because we have accepted irregularity of employment as if it was something inevitable. It is no more inevitable than insistence upon payment for a great

many of the overhead charges in a business, whether the business is in daily operation or is not.

Mr. MANLY. In short, it seems to me that society has to develop the capacity of the individual through scientific management, or otherwise, and it is also necessary for society to take pains that it actually gets the benefit, and actually gets that increased capacity utilized?

Mr. BRANDEIS. That certainly is necessary.

The ACTING CHAIRMAN. Mr. Weinstock:

Commissioner WEINSTOCK. Is it or is it not a fact that labor opposes the introduction of scientific management not because it is scientific management, and that it thinks scientific management an evil, but because it fears that it will be abused to the injury of labor?

Mr. BRANDEIS. I think that is true, although there have been some indications of an objection to scientific management itself; that is, the failure to distinguish very clearly between the grounds on which the objections were based.

Commissioner WEINSTOCK. Does not labor also have a further fear, which leads it to oppose the introduction of scientific management, that its very successful introduction will undermine unionism?

Mr. BRANDEIS. I have heard that expressed.

Commissioner WEINSTOCK. That is, if the worker finds that he is getting all that unionism is getting for him; that is, shorter hours and better pay, that he will have no use for unionism?

Mr. BRANDEIS. I have heard that fear expressed, but I do not think it is sound. It has no basis, I think, because I do not see how scientific management, or anything else, can in the long run get for the worker everything. It may for a time, but unless the interests of the workingman are protected by his representatives, neither scientific management nor any other method of employment or compensation will protect the laborer.

Commissioner WEINSTOCK. Assume, in order to bring out the point more sharply and more clearly, that scientific management to-day was a common condition, had been universally adopted.

Mr. BRANDEIS. Yes.

Commissioner WEINSTOCK. And assuming that because of that the hours of labor had been diminished and the pay had increased, without injury to the worker physically; what think you would be the status of unionism?

Mr. BRANDEIS. I think there would be a good deal left for unionism to do, and I do not think the time will come when there will not be, as long as there is a wage system in existence. That is, this other thing we have been discussing now, the question of the regularity of employment; that is a subject as to which the unions have taken practically no steps up to the present time, and it is a matter which in some ways is infinitely more important than a great many as to which they have. That subject would occupy the unions, I think, for a very long time to come.

Again, I do not feel that we have reached the limit of the shorter day; certainly not in some employments; nor do I think that we have reached the limit of the higher wage; certainly we have not reached the limit of the best conditions of employment in many industries.

All of these subjects are subjects which must be taken up, and should be taken up, by the representatives of the men and women who are particularly interested. There will be work for unions to do as long as there is a wage system.

Commissioner WEINSTOCK. You mean that this bonus system does not deal with the wage itself; it is simply a plus over and above the wage, and that wage would still remain a question for collective bargaining?

Mr. BRANDEIS. I should go even further than that. It is dealing with the wage; I am speaking of the wage as including the bonus or the compensation.

Commissioner WEINSTOCK. No; I differentiate between the wage on the one hand and the earnings on the other. The earnings, of course, would include the bonus and the wage.

Mr. BRANDEIS. Yes.

Commissioner WEINSTOCK. The wage would not necessarily include the bonus?

Mr. BRANDEIS. Well, I think the unions should be heard, not merely on the wage, but on the bonus quite as much as on the wage, and practically on every step that is involved in the system that is installed.

Commissioner WEINSTOCK. I see. Then, your conception of the ideal of scientific management is in giving the laborer a voice in determining all the factors involved in scientific management?

Mr. BRANDEIS. Not only in making the decision, but in ascertaining the facts. Commissioner WEINSTOCK. Exactly. Not only should labor have a voice, but it should select its representatives?

Mr. BRANDEIS. Exactly.

Commissioner WEINSTOCK. And you see no menace to unionism in scientific management?

Mr. BRANDEIS. No.

Commissioner WEINSTOCK. You see a larger field for usefulness?

Mr. BRANDEIS. Very much.

Commissioner WEINSTOCK. And you think the fears, if there are such fears on the part of organized labor, are groundless?

Mr. BRANDEIS. Yes; groundless, except for this: That I think, for instance, that the existence of the system of scientific management, unless the unions choose to cooperate with the effort to install it, may menace unionism, because the most efficient and advanced employer may adopt it, whether the unions like it or not, and in that way these establishments may become successful and be so buttressed by their success as to be able to exclude the union from their business. That is the menace if they do not take part; but if they cooperate, it seems to me it simply advances unionism.

Commissioner WEINSTOCK. Then, reviewing your answer, I take it that your point is this, that in your judgment scientific management opens up a new opportunity for labor?

Mr. BRANDEIS. Yes.

Commissioner WEINSTOCK. That if it is wise it will make the most of that opportunity, enlist its cooperation in the movement, and endeavor to bring it to its highest possibilities at the earliest day, in order that it may better share this increased surplus?

Mr. BRANDEIS. Yes; that it may not only be given a share, but get a very much larger share in the increased production.

Commissioner WEINSTOCK. And in your judgment it makes a colossal error if, instead of working with it, it works against it?

Mr. BRANDEIS. Yes.

Commissioner WEINSTOCK. And it defeats its own purpose?

Mr. BRANDEIS. Yes.

Commissioner WEINSTOCK. That fighting against it will tend toward the destruction of unionism rather than toward its being strengthened?

Mr. BRANDEIS. Precisely.

Commissioner WEINSTOCK. What effect, in your judgment, will the success of scientific management have on unemployment? Will it increase it or diminish it?

Mr. BRANDEIS. One form of unemployment I have already discussed, namely, irregularity of employment, which seems to me to be by far the most serious form of unemployment. It is far more prevalent, and it is far more serious in its effect.

It seems to me that the intensive study of businesses and of the elimination of waste in business must result in regularizing business. Every man who has undertaken to study the problem of his business in the most effective way has come to recognize that what he must do is to keep the business running all the time, keep it full. If it is a retail business, he makes it his effort to make other days in the week than Saturday a great day; he tries to take periods of the year when people do not naturally buy and make them buy, in the off seasons, in order to keep his plant going during the period in which ordinarily and in other places of business it loses money. Now, that effort must proceed in every business, to try by means of invention, and invention involving large investment, to make the business run throughout the year; that is, to regularize the work, avoid the congestion of the extra-busy season, and avoiding the dearth in what has been a slack season.

Now, scientific management must develop regularly; therefore, in developing regularity it will tend to eliminate unemployment. Of course, it also will naturally tend to eliminate that other unemployment, which comes from lack of work to do, because if we are right in supposing that there is plenty of consumptive power but not enough ability to buy the things, then we may be able to produce them cheaply enough and people will want them and will take them.

The ACTING CHAIRMAN. Mr. Garretson?

Commissioner GARRETSON. Mr. Brandeis, would you hold that the elimination of waste was a true economic process unless applied to all the terms of a

problem—that is, to production, to distribution, and to consumption? Would not it be of equal force in all three directions?

Mr. BRANDEIS. It is certainly of equal force in production and distribution. I think there is some waste in consumption, which is a part of the luxury of life.

Commissioner GARRETSON. That is probably true. The thought I had more particularly in mind was what is ordinarily called absorption, the market, instead of the actual consumption.

Mr. BRANDEIS. Yes. I should treat that rather as a part of distribution.

Commissioner GARRETSON. It is in one sense; but it is final, while distribution is in transit.

Mr. BRANDEIS. Yes.

Commissioner GARRETSON. If the application of a principle to production should create an injurious effect on one of those other agencies, for instance, the market, would it be economically sound? In other words, if the agency that doubled the production destroyed the market for the production, it would be bad economics, would it not?

Mr. BRANDEIS. It certainly would be if it destroyed it; but I consider the market as a malleable thing, just as I consider the processes of production and of distribution.

Commissioner GARRETSON. It is malleable to this extent, at least: If those who buy have money to buy, it is malleable. If they have no money, it is ruined, so far as they are concerned. Is not that true?

Mr. BRANDEIS. Yes. If there is a glut in the market, you are apt to have a falling off in prices.

Commissioner GARRETSON. For illustration, it does not matter how cheap a thing is if a man has no money to buy it; it can not appeal to him to the extent of inducing him to buy unless he has either money or credit?

Mr. BRANDEIS. That is true.

Commissioner GARRETSON. In this question—and I am now using “distribution” in another sense, and that is of division—in this question of the proportions in which profit shall be distributed, can scientific solution enter into it at all?

Mr. BRANDEIS. I do not think so.

Commissioner GARRETSON. It is purely a question of judgment, tempered by equity?

Mr. BRANDEIS. Yes.

Commissioner GARRETSON. Or dominated by equity?

Mr. BRANDEIS. Unquestionably.

Commissioner GARRETSON. Bear in mind I do not mean equity always dominates, but that is what it should be determined by.

Mr. BRANDEIS. It is largely a question of power.

Commissioner GARRETSON. That is a foregone conclusion—at least it has been in the past.

Mr. BRANDEIS. It is apt to be.

Commissioner GARRETSON. The man who had the biggest cannon got the biggest share?

Mr. BRANDEIS. My feeling is that that is the reason why the people should have the biggest cannon—because it would be more apt to be shared among many.

Commissioner GARRETSON. I do not believe we will differ on that. Do you believe there is anything in any system of management, whether it may be denominated scientific or efficient or by any other term, that will change the nature of man?

Mr. BRANDEIS. I think he is possible of some modification.

Commissioner GARRETSON. Modification of extremes, possibly.

Mr. BRANDEIS. I think his nature may be refined and bettered, perhaps not revolutionized.

Commissioner GARRETSON. Do you believe even that the man who, under the ordinary system of administration, had bristles on his back would, by the adoption of scientific management, make the bristles into shaving brushes or leave them on his back?

Mr. BRANDEIS. I think we ought to have some protection against him in either event.

Commissioner GARRETSON. You do not believe we would all get shaving brushes free? In other words, the human equation will be just as great under

one system as under the other, and safeguards will be needed against the man who wants more than his due proportion precisely as in the past?

Mr. BRANDEIS. I think so.

Commissioner GARRETSON. I think it is due you to know that a good many who have favored this have taken the position that the altruistic principle was set up in the employer's mind, if not in his heart, by the institution of scientific management in many instances—not by all of the advocates of the system, but by many of them. My reason for asking that question of you is that I have never—well, let me put it this way: I used to go to the Methodist church; they have revivals, you know, in the country churches, and a man gets religion, but I have noticed that a smooth horse trader could make just as good a deal the next morning as he did the day before, and I imagined that under scientific management the man who was reaching out for his handful would still reach.

Mr. BRANDEIS. I think we need democracy at all times no matter what the system is under which we work.

Commissioner GARRETSON. The position has been taken by a number of men—mouthpieces of the system—and questioned by some of us, that the labor union was just like Othello—his occupation would be gone when scientific management was installed. I gather from your position that you believe it has just as much of a mission as it ever had either during installation or pendency of the system.

Mr. BRANDEIS. I think it will be increased; its functions and its scope and possibilities will be increased.

Commissioner GARRETSON. I judge you have given thought to this: Have you ever devised in your mind any system or any agency that could take the place and perform the functions that have been performed by the labor union so long as the wage system is in vogue?

Mr. BRANDEIS. No; I do not think there is any. I think people have got to protect themselves in all positions in life and must be in a position to do it, and I do not know any way in which labor can be amply protected except through its own representation.

Commissioner GARRETSON. You subscribe to the old theory, then, that God helps those who keep their powder dry?

Mr. BRANDEIS. That seems to be sound.

Commissioner GARRETSON. Another question arose here on which I would like to have your opinion. The question was asked with regard to whether or not the high priests of efficiency systems had attempted in any way to disarm the opposition that exists on the part of the laboring men—I am using "laboring man" largely in the organized sense—to the installation of the system and the attitude of labor has been characterized in various ways. But from your standpoint I should be glad to know whether or not you would hold that this is true—that if the system contains the desirable features that have been ascribed to it would it not, if they were able to demonstrate that fact, largely disarm this opposition if the jar bringers would go to the deliberative bodies representing the unions with full explanation of the methods proposed and what they believe would be effected thereby? In other words, if they believe that the advantages which would accrue to these men are so tangible, as it is asserted, that knowledge first hand of those things might disarm a large portion of that criticism, and especially along those lines where the average man feels there is something concealed behind the veil that he fears.

Mr. BRANDEIS. I think, Mr. Garretson, that some of the representatives, some of the experts in scientific management, have been at fault in this respect, but I think very many labor leaders have been at fault also.

Commissioner GARRETSON. I would not question that.

Mr. BRANDEIS. They were taking, to my knowledge, a stand definitely opposed to scientific management—I mean individually, men and bodies—when I was certain they were not familiar with the subject and did not have the basis on which, in the important affairs of life, a man ought to stand—that they did not know these facts. I think it has been unfortunate. On the one hand there have been expressions as to the attitude of labor unions and the possible way in which they would approach it, and on the other hand the attitude of hostility to this new idea which has been opposed by some of the most excellent gentlemen who are well known in the labor movement. Those are misfortunes, it seems to me—but some of the unfortunate accidents that have happened in connection with the introduction of this system. It seems to me that the work which your commission is now doing may be extremely helpful in starting a

new era, in turning over a new leaf, and in letting, on the one hand, the employer and the particular advocates of scientific management, and on the other hand the leaders of the labor movement, understand exactly what this is, what the changes are, what the dangers are which are to be guarded against, and how it is to be done. I think that so far as the past hostilities and some of the past expressions on either side are concerned, the best thing all of us can do is to forget them.

Commissioner GARRETSON. I do not believe there has ever any subject arisen in which there have not been intemperate statements made on each side. But this fact remains: Will the men who now hold the opinions which they do in regard to scientific management ever move from that position as long as the attitude is assumed by those who father scientific management, that because one man may have studied the question of scientific management for 10 years intensely, as applied to the details with which he has come in contact, while the other may have given a lifetime to the study of general conditions of labor and the relations of the employer and employee—as long as the opinion is openly expressed that the man who is influenced by his general view, untempered by his general view, untempered by intensive study of one phase of it is ignorantly prejudiced.

Mr. BRANDEIS. I think this is a case where the wise will yield in their views, and I have great confidence in the wisdom of the labor leaders. I think with the aid which your commission gives we may hope for a clear understanding of this subject and the adoption of that method and that force which will lead to what we all want.

Commissioner GARRETSON. I suppose if any man alive has a right to somewhat question the universal wisdom of the labor leaders, I might be justified in it. I do not know whether one could always bank on that wisdom or not.

In regard to this continuity of service, Mr. Brandeis: Under slavery continuity of service was an absolute necessity. Its ceasing was a virtue and its continuation was a combination of the most obnoxious features of slavery by the owner who was afterwards the employer. In other words, when he lost title to his slave he also evaded the most onerous condition of slavery.

Mr. BRANDEIS. Yes.

Commissioner GARRETSON. That brings me down to just one other question—though it may involve two or three questions. There is no denying this fact, that one of the great fears of the laboring man—and this is not confined to the union laboring man by any means—is that concealed behind the theory of scientific management is an elimination of the men; in other words, that even though it may work out to swell the earnings of the individual, those swelled earnings of the number of individuals who are still employed will be a still far less amount of money than was paid to the number formerly employed. That is putting it in wage terms.

Mr. BRANDEIS. Yes.

Commissioner GARRETSON. I want to ask your opinion in regard to this, because your opinion in this is of value. You are not allied to one camp or to the other; you are standing on middle ground. Just for a moment, let us draw a line around this country, because the result of drawing a line here would be precisely the same as to give us world-wide application.

Taking the population on the basis of 100,000,000, presumably 80,000,000 of those are wageworkers. I think that is not very far out of line with the figures, is it? It is not an unreasonable application of them?

Mr. BRANDEIS. Possibly not.

Commissioner GARRETSON. If the 80,000,000 wageworkers were to at once come under the terms of efficiency systems, and the increased productiveness of each worker thereunder was promoted to the degree that 74 per cent of those workers could bring the same output as heretofore, what would become of the other 25 per cent of workers under this system?

Mr. BRANDEIS. Our 80,000,000 plus the other 20,000,000 would consume a great deal more than they do now.

Commissioner GARRETSON. How many men, by that elimination of that number would be taken from the purchasers, and therefore circumscribe the market that much?

Mr. BRANDEIS. You would not take anybody from the purchasers.

Commissioner GARRETSON. But if he had no money—

Mr. BRANDEIS (interrupting). He would have money because he would have employment. There is not any limit and there never has been a limit with us in the consuming power. The limit that has arisen from time to time has

been in the purchasing power. Take it in the field of railroading, with which you are particularly familiar. Our operations increase at the rate of about 2 per cent a year. For a long period of time the gross revenues of the railroads, in spite of perhaps slight reductions in rates increased at the rate of 6 or 8 or 10 per cent a year. What does that mean? It means in the main an increased production on the part of our people. The average amount of money per family which the railroad revenues of the United States represent is almost as great as the earnings in some countries of the men altogether. Why is it? It is because our people here live better than the people do somewhere else; they have more to eat and they have more clothes and they have more luxuries; they live in better houses and are better off in many other ways.

They are able to do it, but there is no limit. The limit has not been reached. If we can produce more, if we can give men more, men will buy more. The dollars will go further, and there has never, it seems to me, been a greater fallacy than the one which has been constantly urged by laboring men at all times—I mean in the labor movements, in certainly the time I have known them—that there is such a thing as that if one man does more work he takes the work away from somebody else. I think there is an absolute fallacy in that idea, and it is a thing that everybody ought to want in this country—to produce more and have more; and this country, if we can produce it cheaper, will find a full market for it.

Commissioner GARRETSON. But this fact remains unanswered: If there are 80,000,000 wage men and 20,000,000 of them are taken out of the positions which they now hold, you have got to create new industries—

Mr. BRANDEIS (interrupting). Oh, no, you have not.

Commissioner GARRETSON. Without going outside of the country to do it, because we have a wall around it. You have to create a new form of productiveness—

Mr. BRANDEIS (interrupting). Things do not happen over night.

Commissioner GARRETSON. Oh, no.

Mr. BRANDEIS. This introduction of scientific management for the 80,000,000 people will not happen overnight.

Commissioner GARRETSON. I do not think at the rate it is going that it will.

Mr. BRANDEIS. What happens is this—and what has happened in every business so far as I have known, in which not only scientific management, but better processes and cheaper processes of manufacture have been introduced—that that business prospers. No man is turned out of work to-day, or, so far as we can look ahead, will ever be turned out of work because of scientific management; because when you introduce scientific management you increase the productivity in establishment A, establishment A is growing and grows all of the time, because it is able to produce its work better or cheaper, and to expand itself through its better organization.

This process that you speak of, of the ultimate end, during all this time these people will have been placed, placed in doing more work of the same kind, or placed in doing some other work equally profitable, or possibly more so.

Commissioner GARRETSON. Bear this in mind in answering the question: I am not asking it from the standpoint of all of the men I represent, because, first, the men I represent are pieceworkers. Moreover, some time back they reached the limit of what car couplings will hold. Consequently there is no question of increasing their labor under efficiency or any other system. But those are questions that appeal to me in this problem.

Mr. BRANDEIS. I think that field of speculation is one that is based upon an entire misconception. I think that if the labor leaders to-day would look at this matter in a practical way, and not consider what may happen 10,000 years hence—

Commissioner GARRETSON (interrupting). That is when you are setting the limit for efficiency?

Mr. BRANDEIS. I think if you will look at what would happen to-morrow or next year in introducing an efficiency system in a particular business, you will find that all the men in that business are going to be benefited. Take it up one by one, one business after another, and the businesses to which it applies would be advanced. You will have exactly the same situation as has been suggested to me that happened when a man like Ford undertakes this thing. He produces things cheaper and better, and it does not put anybody out of business. There are not less men in the automobile business, or working in the automobile shops of this country, but there are more people who are buying automobiles, and there will be.

Commissioner GARRETSON. They have the purchase price. The buyers of automobiles have the price to buy with.

Mr. BRANDEIS. They have the price to buy automobiles if they are cheap enough, but a man may be able to buy an automobile from Ford at \$575 who would not be able to pay \$800 for it.

Commissioner GARRETSON. But if Ford automobiles were worth 35 cents how many could a man sell in Rutgers Square?

Mr. BRANDEIS. If a man is taught how to work—to my mind there is no such thing inherently as unskilled labor. Unskilled labor is an abomination. All labor ought to be skilled, and there ought to be an effort of everybody to make them more and more skilled. When you find a man who can not earn anything to-day, it is the result usually of a system, of an erroneous system. Sometimes it is an erroneous social system; sometimes it is an erroneous industrial system. Men have not been taught to do things—that is one of the difficulties. Nobody who has to do that business—and certainly it must have impressed you constantly how many people need guiding, how many people need help. The wrong has been done to a very large number of people in not showing them how to do things, or how to do them better. These men who have not the 35 cents are very many of them the men who have not been shown how to do things. That is one thing—that society has tolerated such an abomination as irregularity of employment.

I do not think scientific management, any more than any one other thing we are striving for, is going to solve the human problems.

Commissioner GARRETSON. Good.

Mr. BRANDEIS. Certainly not; and I do not think the labor union is going to solve all human problems.

Commissioner GARRETSON. It has not so far.

Mr. BRANDEIS. It is an extremely valuable instrument and so is scientific management. What we have to do is to avail ourselves of every instrument that is conceivable—labor unions, scientific management, and all the other organizations—and try to remove particular difficulties which exist in the way of these men having the 35 cents, of whom you spoke.

Commissioner GARRETSON. That is all.

The ACTING CHAIRMAN. Mr. Lennon, do you desire to ask anything?

Commissioner LENNON. Mr. Brandeis, we have had several different systems that are called scientific management. Do you think there is any such thing as a determined system of scientific management?

Mr. BRANDEIS. I should not suppose so—not an ultimate system.

Commissioner LENNON. Will you give us your definition of scientific management?

Mr. BRANDEIS. I doubt whether I could state it as well as some others, but the fundamental thought which I have in scientific management is this: In the first place, it puts business on the plan of engineering. It does not let things happen, but it predetermines what is to happen. It undertakes to think out in advance what shall be done in every line of business. That, of course, is taking the broad organization of business and not particularly or solely the work of the workman we have been speaking of now. It plans and it makes things happen in accordance with the plans. It does for business what a time-table does for a railroad; that is, it is on the same basis that the time-table is introduced in the railroad business—to make a train arrive at a particular time. If they have been running too slowly between two stations, or if there has been a particular delay, they undertake to overcome it within limits and reach their destination according to schedule.

That is one of the fundamental thoughts in scientific management. Another one is to find the best possible way of doing everything and of coordinating the best possible ways of doing all the particular things, so that it results in the best possible way of doing the whole. It recognizes that every single department of a business, and every part in the process of business is worthy of special study for the purpose of finding out how best it can be done and how the waste which inheres in it may be eliminated.

Those are the elements of scientific management. Now, a number of gentlemen have undertaken to approach this in different ways, recognizing, for instance, that one of the problems is to get the man to do the thing in the best way, after you have found out what it is, and to keep him at it. They undertook to devise a bonus system. That is merely one attempt to influence the individual, to attempt to find out; but it is merely one way; there are a great many other ways of doing it. You can conceive of other ways, and nobody can state in

regard to these things that the way he has found out is the ultimate way any more than he can say, "I have found a way of shoveling a certain amount of coal, and that is the best way of shoveling that amount of coal that ever was devised." Well, it may be infinitely better than the way that was used for the last year, or 10 years ago; but it would seem to me a bold thing to say that it is the best way that can be devised. We are finding out new ways of doing things all the time; we are finding out new ways of pitching a ball, and it seems to me we may find new ways of shoveling coal.

But the very essence of scientific management is to say that the mere shoveling of coal or the lifting of pig iron is a thing that may be done badly and wastefully, or that it may be done well, and then to find out how to do it better, and in order to find it out you must adopt exactly the same methods that have been adopted in the field of science—by study and observation, and patience and careful observation, such as the scientists have applied in their department.

Commissioner LENNON. Then I understand, from some things you have previously stated, that in working out what you have defined as being scientific management that labor is entitled to take the same part in working out this scientific system of industrialism that the employer is entitled to?

Mr. BRANDEIS. It seems to me so.

Commissioner LENNON. Then I just want to ask you one more question. Tradesmen have been practically taught since time immemorial that the best work possible for a mechanic was the work which develops his personality or in work in which his personality is developed. For instance, the sculptor—that is, the high type of it—the personality of the man appears in his work. Now, I say for myself, as well as for many laboring men, that it is to some extent the fear of eliminating this personality in the things which he produces and that personality of making it the very best thing or one of the very best things that have been produced in the different crafts and trades; that is one of the reasons why I do not like the apparent leveling process of what is called scientific management. What do you say to that?

Mr. BRANDEIS. If I thought it would eliminate or reduce individuality, using that in the best term, as I understand you to do, I should be definitely opposed to scientific management. I think that after all, our business is not to make goods, but to make men, and the reason why I feel such an interest in scientific management is that it does tend to make men, in my view of it. I feel that one of the first things that ought to be done to develop a man is to make him realize the possibilities of accomplishment, the joys of accomplishment, and the possibility of development in the work which he is doing. He has got to conclude, whatever that work is, that it is something which he does do better or may do better than he did before, or perhaps better than others do. He ought to realize all the time that he has not gotten to the end.

Now, I feel that one of the great defects in a large portion of the work done to-day is that the men who are doing it do not feel real joy in their work; they do not feel joy in the accomplishment; they do not have any standard by which their accomplishment can be measured as compared with somebody else. Everybody realizes that this very measuring is the thing that he feels happiest about. He wants to play a game of ball, and he wants to win, which means that he has played better than anybody else, and he gets that test in the competition of a game of ball as to whether he has done well, and he is delighted with his particular performance, whether as pitcher or as catcher or on the bases. It seems to me that the objection to a large part of the work which is done to-day is that men have not standards; have not tests as to the excellence of their work. To my mind the best game that there is is the game of work, and I want to see men in it for all the joys that come with the working effectively, and I think it is possible to do it, and I think that one of the first steps is the standard.

I do not believe for a moment that when some of our friends of scientific management have worked out a way of doing a thing, which may be infinitely better than it was done before, that they have attained the best possible; it is the highest that has been possible up to that time; but I should regard each step that they have taken as a "thank you marm" from which you would start up to the next.

Commissioner LENNON. There have always been men in the world and women in the world, and are yet, in all lines of work, that have taken some pride in the things they produce, taken more pride in the things they produce than they did in the wages they received from it.

Mr. BRANDEIS. I think that is true.

Commissioner LENNON. Can you say that there would be any destruction of that under this scientific management of which you speak?

Mr. BRANDEIS. I should expect the reverse; I should expect it would greatly stimulate satisfaction in performance, because it would give what people need, a test of excellence, and this would be a constant test. Now, the only thing we have to look out for is that men in their eagerness to go forward do not go too fast. Most of them will not go too fast, but there are some men who will, and it is well enough to have some one call their attention to that possibility; but there must be an immense satisfaction to men when they have a proper and reasonable test of performance in seeing that they can attain it, or beat what they did before, and possibly what the other fellow did.

I think an immense deal is lost—no matter what the work is, whether it is shoveling coal or anything else—an immense deal is lost in the pleasure and satisfaction of life and development of the individual when you take away from him the opportunity of measuring himself against his own or somebody else's record, and you have got to have a record in order that you can measure it.

Commissioner LENNON. I apprehend that you know, and I feel, that one of the wonderful subdivisions of labor in the last 40 or 50 years has eliminated some of that pride and personality in production?

Mr. BRANDEIS. It has.

Commissioner LENNON. There was a time when a shoemaker was the philosopher and scientist of the world, almost—more so than any of the other classes, outside of a very few. Isn't that true?

Mr. BRANDEIS. There are some good philosophers among them even at present, and I think you will find among them also, you will find among these shoemakers some men who have a very high conception of excellence. Take some of the welters or treers and edge setters, and you will find that those men can draw a clear distinction between a good job and one that is not good.

Commissioner HARRIMAN. I wanted to ask you something that you partially answered, and that is, that if the art of scientific management is all that its exponents claim it is, how do you propose to bring about a better understanding of it on the part of the workers; that is, of educating the laboring people to appreciate the value of scientific management? You spoke of what this commission might do. Of course, we will recommend or not recommend it, but how far is that to go?

Mr. BRANDEIS. I think that will go very far, because you have on your board three very distinguished members of labor unions, and if they should agree with the view that scientific management can be introduced consistently with the welfare of the worker or of the union, I think that would go very far toward producing the result that you desire, and, of course, beyond that it is a question of patient individual discussion.

Commissioner HARRIMAN. Missionary work?

Mr. BRANDEIS. Missionary work, because you have a prejudice, and you will have to overcome prejudice.

Commissioner HARRIMAN. It struck me that it would be of great interest to the commission to have in its record your definition of bonus, premium, differential piecework, and piecework systems of payment. I think it would be too much to ask you to do it now, but would you dictate it some time to your secretary and let us have it?

Mr. BRANDEIS. I would be very glad to do it, but I think experts on that who are exponents of these various systems could probably do it more accurately than I could. I should be afraid I might represent one or the other.

Commissioner HARRIMAN. I may be very dull, but after listening yesterday and the day before, I was a little more confused than I was before as to just what the difference was.

Mr. BRANDEIS. I am inclined to think if you request them seriously—I should, in view of your question, suggest that each one of them be requested, for the purpose of the record, to state his understanding or his definition of the particular method or incentive which he creates; I think that would be fairer to them, possibly.

Commissioner O'CONNELL. Those who have come before us have told us that they have been interested in this system some 30 or 35 years, trying to introduce it, telling us—Mr. Taylor, for instance, that he did not pretend to introduce it in a shop inside of two years, and preferably five years, to work it out properly. We have known of it more or less by reading books and hearing of these systems, for the last 30 or 35 years; at least, I have. I think probably

in the last two or three years your writings and your speaking on this subject of efficiency have probably given more interest in the whole proposition, as to the saving of waste, and all that sort of thing, and efficiency in management, than all the writers and speakers that have come before us. I do not think there is any question about that, that the public have it more in mind than in the years gone by, until within the last couple of years, perhaps, so that the public rather look upon an expression from you as a real authority upon this question of efficiency.

In your opinion, if efficiency, as you understand it, is not adopted in a general way in our plants and workshops and business, is that going to be a real cause of industrial unrest, or has it been a real cause of industrial unrest because it has not been adopted?

Mr. BRANDEIS. Let me, before answering that question, say one word about your reference to this subject of scientific management having been in the minds of people for 30 or 35 years. I think that may give misapprehension, or be a basis for it.

There undoubtedly has been an effort for 35 years, and perhaps for a longer time than 35 years, to improve management in particular departments. Men have realized the importance of greater efficiency, although that particular term was not used widely before; but the different rules and the different views and the different steps which had been taken have not been formulated until within a comparatively short period. It seems to me that the rules, the method of approach, did not reach a point where you could properly speak of the science of management, until very recently.

Now, answering your specific question as to the effect of scientific management as bearing upon the subject of unrest, my view is simply this: Unrest will be to a certain extent mitigated by anything which improves the condition of the work, and I can not see any real solution, ultimate solution, or an approximation of a solution of unrest as long as there exists in this country any juxtaposition of political democracy and industrial absolutism. To my mind, before we can really solve the problem of industrial unrest, the worker must have a part in the responsibility and management of the business, and whether we adopt scientific management, or adopt any other form of obtaining compensation or of increasing productivity, unrest will not be removed as long as we have that inconsistency, as I view it.

Commissioner O'CONNELL. We have your opinion in the record as to how to get the labor leaders and the laboring men to see the benefits of the efficiency system, by several questions asked you. I want to know how we are to get it from you now so as to get it in the record; how we are going to teach the employer to come into sympathy with organized labor, and not only into sympathy, but into business relations with organized labor.

Mr. BRANDEIS. There again I think we are fortunate in having representatives of the employer upon the commission who will have to do missionary work with the employers as you gentlemen will be called upon to do with the working men. I feel this, however, and I ought to say this: I am convinced that among the efficient employers the consideration which makes them most apprehensive of the labor unions is the belief that it is the policy of the unions to restrict production. If that belief can be overcome, and the foundation for the belief, where it exists, can be removed, I feel quite certain that a very large part of the best employers will welcome cooperation with the union.

Commissioner O'CONNELL. One of the exponents, or scientific engineers who have been before us, in answer to a question as to whether this subject was not one of mutual consideration and could not be dealt with by committees on both sides, and so on, said that in his opinion that probably after the system had been in operation for two years and probably longer, better five years, and that then probably the question of mutual bargaining might be taken into consideration; that nothing in so far as the basic rate or wage rate upon which the bonus were paid afterwards should be considered, not the establishment of the rate, and not the bonus, but the wage rate; if wages went up or went down, the question of wages might possibly be a question of bargaining. Do you think that is logic, that that will tend toward advancement of efficiency?

Mr. BRANDEIS. I think that is absolutely unsound.

Commissioner O'CONNELL. You feel that the employer ought to meet the employee as a representative of his organization, and go into the question as he would any other question?

Mr. BRANDEIS. Precisely. Take the first question; take the question which has been so much talked about, although it is only one of the many things

that are bound to come up—the question of how long a time it takes to do a given operation in which a stop watch is used.

Now, in order to determine that question, nothing more is necessary than correct observation, assuming that the worker is working naturally; and yet I can see that it is absolutely essential that representatives of the workers should participate in making that observation, because it is important not only that it should be correct, but that the worker should know that it is correct, and should have the means of convincing himself that the conclusion that was reached was properly reached, both that the observation was properly taken and that the performance that was going on was a normal performance when it was going on, and was not something abnormal.

Now, I can not see that there is any single point in which the union should not be represented. If any calculation is made—there are many mathematical calculations that have to be made—and the laws of arithmetic or calculus, or anything else that may be applied, are certain, and I think the union has a right to know that those laws are properly applied and that the result reached is a correct result. I can not see that there is any point in the process, either in its introduction or in its application, after it is produced, in which it is not essential that both parties in interest should have their representatives.

I could perfectly well conceive that a man might be selected who would have the confidence both of the employer and of the union, and who, as an expert or as a scientific manager, would be called in there and would do it all, because you both trust him and you employ him jointly, as you many a time in the case of a dispute select jointly an arbitrator.

Commissioner O'CONNELL. Mr. Taylor, when he was before us the other day, was speaking of the question of dealing with the men—giving them a say in the matter—which led me to believe at least that this idea of giving the men a say was, for instance, to say to John: "John, we are going to do something here, and we want you to cooperate with us. If you do, you will not be hurt by it, and during the time that you are cooperating with us, we will pay you double time to show you that we are in good faith." The impression I got from Mr. Taylor was that the idea he had was of John being taken into the proposition.

Mr. BRANDEIS. That is contrary to all principles of collective bargaining.

Commissioner O'CONNELL. You would not consider that a fair way of treating John?

Mr. BRANDEIS. Not any more than I should in any other case where we have collective bargaining, or making a wage in any other way.

Commissioner O'CONNELL. Now, in the introduction of a scientific management in a plant, where they increase, as they tell us they have, 100 to 800 per cent of the production of the plant or in the production of the men—the joint production—they greatly increased the cost to the employer, and slightly increased the wages of the employee; the employer has been put to a very great advantage in the matter of going into the markets, if his competitor was working under the old system, according to their way of thinking. Well, is there any reason why that firm should not at once begin to give the employees a share in the benefits by a reduction in the hours of labor?

Mr. BRANDEIS. My own view of that is this: That in that process—of course, in the cases that I have known of there is not the outer limit which you have mentioned—but in the cases with which I have been most familiar, I should think that the advantages were, perhaps, as a rule, divided pretty equally between capital and labor and the community. I mean that it generally resulted in some concession in the price of the article to the consumer; but it seems to me that it is highly desirable, as an incident of scientific management, to reduce the hours of labor, unless the hours of labor are already as short as they ought to be, and I know of very few cases where they are.

Commissioner O'CONNELL. Have you any experience of any plant, firm, or company that have had in inauguration for a number of years the system, where they have reduced their hours below 10, as the result of the introduction of the system?

Mr. BRANDEIS. I could not say that there was a result, but I do know there has been a tendency to reduce.

Commissioner O'CONNELL. There has been a tendency?

Mr. BRANDEIS. I know a number of them have reduced it; but I doubt whether it is a result. I think if you had had a potent union in that organization they would have taken that opportunity to insist upon a reduction.

Commissioner O'CONNELL. Of course, the unions get these things later. A prominent Senator told me once, when I called upon him here at the Capitol, in regard to the question of the eight-hour day, he said "I would go out and take the people and organize for eight hours; I would not bother here about it." That is how we got eight hours; not because they were given to us.

Mr. BRANDEIS. I do not believe things are given to men as a rule; and I do not think it would be very desirable if they should be.

Commissioner O'CONNELL. You think the introduction of this system, if it does anything, ought to be able to reduce the hours of labor?

Mr. BRANDEIS. It ought to make it possible for the hours of labor to be reduced, and living conditions to be improved, and I think it would.

Commissioner O'CONNELL. That is all.

Commissioner COMMONS. Do you know of any establishments that have adopted scientific management in which you think the men were being driven beyond what would be considered a proper amount of exertion?

Mr. BRANDEIS. I have not, in my own knowledge, no; but I think it quite likely that it would happen.

Commissioner COMMONS. Have you known of establishments which have not had scientific management in which they have been driven?

Mr. BRANDEIS. I have known of a great many.

Commissioner COMMONS. Now, we learn from the working people that in some establishments which have scientific management the men are driven; if we should find, as a matter of fact, that they were driven, on investigation, would you say that that was scientific management?

Mr. BRANDEIS. I should think that it was a misapprehension of it, that it was not perfect scientific management, and I should say that what had happened had probably happened because the men did not have intelligent and effective protection, such as the union ought to be able to give them.

Commissioner COMMONS. Then, to get at a definition of what is scientific management, have you worked out in your own mind certain rules or principles that we could apply as a test of whether it is scientific or unscientific?

Mr. BRANDEIS. Well, I think it would come, in dealing with the particular question you refer to, to the matter of application of science. There is a science of medicine, and yet in therapeutics, as in other departments, you may misapply the rules and you may produce some very great wrongs because you have failed to apply them properly. I think the rules of scientific management, as they are, may be perfectly correct, and that they may be misapplied; and I regard scientific management not as a perfected system, but as a method of approach more to the problems of business; it is a determination to solve, a recognition that there are problems, and a determination to solve them in certain definite ways. You may be applying scientific management, but it may be applied imperfectly, if you produce the result that you speak of.

Commissioner COMMONS. Other advocates of scientific management—of course you are evidently a strong advocate of scientific management—lay down, in their writings, certain principles. I do not find in any of them that one principle which they recognize should be there the principle of collective bargaining. If we were going to reach scientific definitions of scientific management, should we say it is scientific only when it has collective bargaining, as you have discussed it to-day?

Mr. BRANDEIS. I do not think I should put it exactly in that way. I should say it is an essential condition to safety in applying the method of operating businesses, and of solving the problems, that there be representatives of both parties, but I think perhaps it would not be entirely accurate to say that collective bargaining was an essential principle of the science—essential to the safe application of the science.

Commissioner COMMONS. We are circulating definitions of scientific management amongst the members of this commission, and perhaps you would add your contribution when our effort gets around to you?

Mr. BRANDEIS. If I can produce anything that is worthy of submitting to the commission, I shall be very glad to do so.

Commissioner COMMONS. As I judge, scientific management with you has resolved itself down, not into principle and rule, but into accurate measurement. It seems to me that time study and any method of accurate measurement is the final analysis of the method—including, of course, the elimination of waste—the object being to eliminate waste by means of accurate measurements of whatever effort you undertake.

Mr. BRANDEIS. I should not put it that way. I think that accurate measurement stands with reference to scientific management as accounting stands to business. You can not find out whether you have adopted the best way unless you have some record. You have to know your facts. You may have the best record in the world, and may be running your business extremely poorly. You want to know what you are doing. You want the chart. That is what it is; it is the observation by which you navigate. Having taken that first step of finding out or analyzing or dividing the operation into its atoms, in order that you may study it in detail, then comes the question, and there should be an infinite field for invention. I am using "invention" in the broad sense of finding the best method of doing a thing. When you have take that time study, when you have analyzed, when you have a realization of the fact of these various things that have all been involved in what has previously been considered a single operation, and learned to eliminate one after another, that is the process which becomes possible through your time study or through your careful analysis. But it is another process of the mind. I should regard the time study, however important it is, as but a very small part of the science of management.

Taking scientific management as a whole, the most important thing in it is its preparedness, its converting the business, elevating the business into a proposition of engineering, thinking out in advance how a thing ought to be done, what the processes ought to be, and making sure that they are done according to the schedule which you have worked out; that there are no accidents; that there are no things happening by chance. There is where a very large part of the great advance has got to come—that everything is known. Of course, in that comes the process of development of the individual, so that he fits into the particular job, just as the particular operation fits in at the proper time.

Commissioner COMMONS. To get back, let me ask this other question: In this discussion, so far as we are concerned with it, it is not so much dealing with machinery and mechanical things that can be measured, but it is dealing with a bargain between two people—an employer and employee, or a corporation and a union. It is not like the science of astronomy or any of the sciences of business which tell you where your best markets are and where you can make the best sale and where you can buy the cheapest; but it is the one specific thing of making a wage bargain. The engineer can deal with machinery and the routing and systematizing. But is there any principle that differs from a mechanical principle that could be applied to this human thing, which is, as you stated, an expression of power—one power against another—in reaching a bargain which is figured out, in a way? Is there not some principle there that is quite different from that usually recognized as scientific? Must we not recognize something else that is not scientific?

Mr. BRANDEIS. I do not think anything ceases to be scientific. I suppose we speak of economics as a science. It is a fairly inexact science. We speak of ethics as a science. They are all fairly inexact. Still, we are endeavoring to approach to some recognition of human law and of applying human law. The ultimate problems in the wage system have got to be human problems—how men are to get on with one another and what ultimately shall be the share of the one or the other in comfort or in money. There is not any science, in the strict sense of laying down a rule, easy of application or mechanical application which may deal with this problem. The question of how the profits of a business are to be divided is a question that can only be worked out through mutual power or influence, with, of course, a recognition of some fundamental principles. I can see nothing in scientific management that should be a substitute for that process of adjustment, but I do think that it makes possible an adjustment, because it opens up an entirely new field of profit, and therefore the natural and proper demand of the working classes for better conditions, in which the whole community is as much interested as they are themselves. Those demands can be met, and it offers a solution, or a partial solution, in the problem of discontent, because it opens up new fields. It presents, in respect to existing industrial discontent, the same sort of solution that the opening up of immense western lands presented to the problems of civilization 50 years ago. It was not any solution at all for the ultimate problem, but it gave a way out, and it seems to me that is just what scientific management does here. If it is a fact, as it appears to be, that we can increase the productivity of men 30 or 50 or 100 per cent or more, there is the chance to satisfy the natural demand of American civilization, just as we could if we had to offer them that immense

virgin soil, as we had the opportunity of offering 25 or 50 years ago. That is the thing; and it seems to me we have the greater need as a community, as well as working men; we have the greater need of the full utilization of the conservation of energy which is afforded here, because our free lands are practically exhausted in America now, and we are coming to meet the difficult problems of increased cost of living incident upon the agricultural lands being fully taken up. The community needs this as a whole, just as the workman needs it, largely for that reason.

Commissioner COMMONS. That is all.

The ACTING CHAIRMAN. Mr. Garretson wants to ask another question.

Commissioner GARRETSON. Mr. Brandeis, I want to ask another question that I overlooked before. Would you regard an allowance in time to the employee performing a task more efficiently as just as much a bonus as though he were paid an added price therefor?

Mr. BRANDEIS. You mean an allowance of free time?

Commissioner GARRETSON. Yes.

Mr. BRANDEIS. You mean shorter hours of work?

Commissioner GARRETSON. In other words, if he finished an eight-hour day in seven hours; if he was allowed the eighth either to sell back or to use for himself, would you consider that just as much a bonus as if a certain addition of pay were granted and he was used for the hour?

Mr. BRANDEIS. I think under the circumstances it might be more valuable than the additional pay.

Commissioner GARRETSON. Has your attention ever been attracted to the fact that one of the largest industries in the country has been paying on that bonus system for 30 years?

Mr. BRANDEIS. It has been not uncommon in the shoe industry.

Commissioner GARRETSON. I mean universally in an industry.

Mr. BRANDEIS. I have not known of it as a universal thing.

Commissioner GARRETSON. Have you ever had occasion to look over the trade agreement in effect on any railroad on this continent, between either the Brotherhood of Locomotive Engineers, the Brotherhood of Firemen and Engineers, the Brotherhood of Railway Trainmen, or the Order of Railway Conductors, on the one hand, and the employing company on the other hand?

Mr. BRANDEIS. I do not recall that I ever made any study of it.

Commissioner GARRETSON. It is universal on the continent, including the countries of Mexico and Canada. Every freight mile that is run on this continent is paid on a time-bonus basis. All the agreements read like this, and this is the standard phrase in every one of them:

"One hundred miles or less, ten hours or less, constitute a day."

If they run 1 mile in 10 hours, or if they run 100 miles in 1 hour, they have rendered an equivalent for the daily wage, and all the other time is theirs. It is usual on what are known as the "red-ball" trains—I suppose you have become familiar with that phrase—that run at 12 or 14 or 16 miles an hour, hauling competitive freight from one terminal to another, that it will run 100 miles in 6 hours. On arrival that entire crew are paid for that 100 miles, in accordance with the agreement, and the other four hours are theirs; and that has been universal in application for 20 years, has been common for 30 years, and exceptional for 35 years.

Mr. BRANDEIS. I think there is one difficulty in that situation. The running of that in a short time, or the failure to make the 100 miles in 5 hours instead of 10 hours, may be due in very large measure to causes for which the trainmen themselves are in no respect responsible.

Commissioner GARRETSON. That is true. That influence would be a retardant?

Mr. BRANDEIS. Yes.

Commissioner GARRETSON. It could not accelerate beyond a certain point, but it could retard?

Mr. BRANDEIS. It could conceivably retard.

Commissioner GARRETSON. Overtime or overmileage is paid in addition to that, if their hours or miles should exceed that.

Mr. BRANDEIS. That suggests to me a thought which has been very much in my mind in connection with railway service, of an opportunity that I think was lost in the introduction of scientific management. The greatest single item of expense on railroads, as you know, is coal.

Commissioner GARRETSON. Yes.

Mr. BRANDEIS. The amount of coal used is very largely dependent upon the engineer and the fireman. They can make the coal go further or not, as they please, and the limits as to what they can do are well known. The tests show that it would be comparatively easy to reduce consumption 25 per cent and quite conceivable to do it 50 per cent. It seemed to me that when the proposition came up for increasing the wages of the engineers and firemen, there was the chance to apply scientific management. Taking the whole situation as it was, the user of coal, as it was, here men could have been paid according to their performance in the use of the coal. If less coal had been used to produce a given result, of course there would have been a great saving. That saving might have been paid in considerable part to those who brought it about. It would not have involved more work, except certain brain work on the part of the engineer or fireman. It would have involved more care and less physical work, if anything. It would not have involved the discharge of a single man, because you would have had the same locomotive engineer and fireman employed. But you would have had a clear case of the saving affected in a necessary element in railroad operation through the application of care and intelligence on the part of the men who were performing the duty, and the men themselves, the engineer and the firemen, would have been better off and worthier men, and developed themselves by that application.

It seems to me there was and is still a great opportunity for the application of scientific management.

Commissioner GARRETSON. Have you ever known of but one effort to introduce it on those men?

Mr. BRANDEIS. I have known of very little effort.

Commissioner GARRETSON. There has been one railroad where it was tried, and, so far as I know, only one. But I think some of the elements that entered into that have probably gotten away from you.

Mr. BRANDEIS. That is quite possible.

Commissioner GARRETSON. Bear this in mind: I am only talking, not from personal knowledge, because I was in no way connected with the case. Here is what men said to me afterwards. I never happened to come in contact personally with scientific management as applied to my own men, because, under the system we operate, it is not possible yet that it could produce any greater state of efficiency in train movement—I am speaking of the train, and not the engine—than now exists. But in this instance the allegation is made by those who did work in connection with it that it did involve the application, extra work, and more time. I do not pretend to pass on the correctness or incorrectness of that statement, but it was from that viewpoint that the engineers opposed it, as I understand it. Mr. Stone has never told me. I have heard this from the men who were on that line.

Mr. BRANDEIS. I have no doubt it involves more care. It involves a certain amount of education, and it involves time in acquiring education.

Commissioner GARRETSON. I was speaking of the loss of time in transit.

Mr. BRANDEIS. I understand that it is not true that it involves a loss of time, or at all events that it would not come quite within the time limits that are fixed. I am told that Col. Goethals undertook exactly that method in operating the railway in connection with the canal and has had the most successful results.

Commissioner GARRETSON. I do not know as to that. I have not canal jurisdiction.

Mr. BRANDEIS. I think you will find it in his reports that he has undertaken exactly the methods laid down by the scientific managers to undertake to instruct the men; that he employed traveling engineers—

Commissioner GARRETSON (interrupting). Every road does.

Mr. BRANDEIS (continuing). Who went about and instructed these men in the methods, and that as he instructed them it produced this economy in fuel consumption.

Commissioner GARRETSON. There is not a railroad on the continent, to any extent, that does not employ traveling engineers for those purposes, those positions being filled by men who have long developed excellence.

Mr. BRANDEIS. What I mean is that there is the opportunity for the application of a standard. Give a man something that he can measure his performance with. Whether he is going to use more coal or less coal ought to be a subject of tremendous interest to each man.

Commissioner GARRETSON. There is no question about that.

Mr. BRANDEIS. And he ought to have an accurate test of it. He not only feels satisfaction if he succeeds in running with less coal, but he ought to be rewarded according as he does.

Commissioner GARRETSON. I have no doubt the spirit that actuated the men in that one instance—the only one I know of, to wit, the Santa Fe—was something like this: It is a misfortune that you have not been here during this hearing—

Mr. BRANDEIS (interrupting). I presume that is true.

Commissioner GARRETSON. Men do not take kindly to being "shooed." I believe if you had sat there, as I have, during these days, you would have gotten the same impression. While nobody has put it in such terms, I gathered the idea from the testimony of the men who are the fathers of the system, that the mission they were exercising was to correct the mistakes that God Almighty had made in the creation—to get all men just alike, to abolish individuality absolutely, and turn them out like tin plate. Man will never accept anything with that spirit brought to him.

Mr. BRANDEIS. He ought not to. Taking this particular instance which we have been discussing about the user of coal, it is not conceivable that any 10 men who are running engines, under exactly the same conditions on the same road, would come out alike.

Commissioner GARRETSON. No; of course not.

Mr. BRANDEIS. Every man would be different from every other one.

Commissioner GARRETSON. That is a foregone conclusion.

Mr. BRANDEIS. And every man would obtain his particular result differently from the others, and he would have something to measure by as the result.

Commissioner GARRETSON. There is a lot in the way men are approached.

Mr. BRANDEIS. Exactly.

Commissioner GARRETSON. I think, judging from what I have seen of men in other occupations—I have seen a man who made a bet that he would go out with a bunch of twenty-dollar gold pieces in a certain crowd and there would not be a man take one of them, and he made good, because they would not take his money. He had good twenty-dollar gold pieces and wanted to give them away, but they would not take them. That is true of other things.

Mr. BRANDEIS. Absolutely; that is true.

Commissioner GARRETSON. That is all.

Commissioner WEINSTOCK. Just for the purpose of correcting the record, I am sure Commissioner O'Connell inadvertently made a statement that Mr. Taylor while on the witness stand had said he would not favor giving labor a voice until some several years after the system had been introduced. In looking over my notes I find this is what Mr. Taylor said—

Commissioner O'CONNELL. I may have gotten the wrong name; it may have been another witness.

Commissioner WEINSTOCK. Here is what Mr. Taylor said:

"I think well of giving labor a voice in determining these prices and premiums under scientific management."

It was Mr. Mixer who said he would not give labor a voice; that he would not think it wise to give a voice until the bonus had passed the experimental stage.

Commissioner O'CONNELL. Which was about five years?

Commissioner WEINSTOCK. Yes.

Commissioner O'CONNELL. The names do not cut any figure; it is all in one family.

Commissioner WEINSTOCK. Except that it might do Mr. Taylor an injustice.

The ACTING CHAIRMAN. Mr. Brandeis, in the statement you have made you have pretty fully covered the questions I was going to ask; but I want to hand you the tentative definition that has been prepared by some of us, and I wish you would take the pains to go over it and give us the benefit of your criticism, rewriting it entirely if you wish.

Mr. BRANDEIS. I shall be glad to do so.

The ACTING CHAIRMAN. We are certainly very much obliged to you, Mr. Brandeis, for appearing before us.

We will take a recess now for about 10 minutes, and will reconvene at 25 minutes of 5.

(Whereupon, at 4.25 o'clock p. m., the commission took a 10-minutes recess, and at the expiration of the recess reconvened and proceeded as follows:)

TESTIMONY OF MR. JAMES GOLDEN—Recalled.

Mr. THOMPSON. If the commission please, we have finished the direct examination.

Commissioner DELANO (acting chairman). Perhaps you would care to complete your statement, Mr. Golden.

Mr. GOLDEN. I have just this other statement to make, and then I think I will wait to be questioned, which might bring out better some of the things I have in mind, and if they are not covered by the questions I will claim your indulgence for a few moments to cover them.

Much has been said here in questions, and I do not know what has been said previously, in regard to the attitude of organized labor. It ran through my mind while Mr. Brandeis was speaking—and I might say that Mr. Brandeis and I have discussed this subject for hours at a time within the last three years, and I wish he were here so as to allow him to have the pleasure of hearing me say that he has come over to some of our ideas during the last three years.

In 1911, on March 21, if I am not mistaken—and if I am, Mr. Emerson will correct me, as he was one of the speakers there—we discussed this problem in the Economic Club in Boston, March 21, 1911. I would be glad to leave what I said to the commission, but I want to read the closing sentence. I was speaking exclusively in regard to the textile industry, and being in New England, of course I spoke in regard to the men who were placed at the head of the large textile mills and corporations, some of them having from 10 to 20 mills, and on the system of promotion, which simply meant that if a man came from a certain family and bore a certain name he was made head of the concern. That has been a constant grievance with us for a long time up in that section, and the process was that as a boy he went to high school, as a young man he went to college, and when he finished the college course he came down and became a mill agent, and when there were not any places, or not enough places as mill agents, they put him to work selling cotton or cloth until a vacancy occurred. The last part of the speech, of course, is the matter I particularly wish to refer to, but I had better read it all, so that you will grasp the idea.

“Efficiency and ability counts very little against blood relationship, ‘pull,’ and influence in securing the higher positions in the management of textile mills; in many of these mills there is as much ‘waste’ made by inefficient management and incompetent management as would give the operatives a 10 per cent increase in wages. Of course, some of these kind of mills get back some of this loss, by resubmitting this waste over and over again to the manufacturing process. Then the consumer suffers, but the greatest sufferers are the men and women and children working long hours under indifferent conditions, making amends for the blunders of those ‘higher up,’ blamed, fined, and discharged many times for imperfections over which they have no control, and all for a wage that keeps them just 48 hours from starvation. If this idea of scientific management will remedy all or even some of these evils then I say let us have it by all means, if it means a lighter burden for the toiler, if it means a better living wage, then the sooner it comes the better. Organized labor will not hinder it or place any obstacles in the way, but will do as it has always done, cooperate and assist in every possible manner, if allowed to do so. But let me say, in closing, and I can not say it too strongly, that if this scientific plan is another means of still grinding more out of the employee, if it means more production with less remuneration for the toiler, then organized labor will fight against it, as it has at all times fought against industrial exploitation of the wageworkers.”

That declaration was made in 1911, and I have not seen any reason yet to change my mind, and I think I am perfectly safe in saying that that is the attitude of organized labor.

Commissioner DELANO. Mr. Weinstock.

Commissioner WEINSTOCK. You have given us a concrete illustration this morning of what happened in a certain mill where they attempted to introduce the so-called scientific management, which led to two strikes within a brief period of time.

Mr. GOLDEN. Yes.

Commissioner WEINSTOCK. Now, would you call that scientific management? Did not the results make it clear that it was unscientific management, misnamed?

Mr. GOLDEN. But engineered by scientific experts.

Commissioner WEINSTOCK. Yes; but if we are to judge everything by the results, that was a failure, and hence it can not be scientific, because a thing that is scientific is not a failure. In fact the very meaning of the word "science" is to see the end at the beginning. Now, if that promoter or that manager could have seen the end in the beginning he would not have introduced it in the manner in which he did, and the very fact that he could not see the end in the beginning is proof that it was unscientific.

Mr. GOLDEN. But he came in there a total stranger to the local conditions, and, as I know since, without even the indorsement of the man who had been there, and who, as I stated, had lost the job; he came in there and, without asking the cooperation of the man who had been in charge—and the women in there were not even considered; of course, they were part of the machine, I suppose—and put it into effect.

Commissioner WEINSTOCK. You could not offer any better evidence to me that he was unscientific when he attempted to do that, so that it was a case of having the wrong man on the job, and it was not the fault of scientific management, as I see it. Now, you have pointed out that if scientific management results in grinding out more work from the worker without due and just compensation you would oppose it. You probably heard Mr. Brandeis, who is perhaps as intelligent an exponent of scientific management as we could hope to find outside of the professional ranks. You heard him state, among other things, that his idea is to give labor an equal voice, absolutely an equal voice with the employer in every move that is made. Now, if that is done, the abuses of the system which you fear can and ought to be guarded against. If you, for example, represent labor, you are going to see to it that in the introduction of that system it is not abused, and if an attempt is made to abuse it you will protest against it and will have an equal voice with the management in the matter. You doubtless heard Mr. Brandeis, and I should be very glad, as a representative of the employers, to have an expression of your dea as to his views. The substance of what he said is about as follows: The unions fear that the system will be abused, and also that if it succeeds it will undermine unionism. Both fears, he went on to say, are groundless; the system can not be abused if labor has a voice; it will not undermine unionism because labor must be organized to have a voice in scientific management, and because there is much that will demand a voice in the matter of hours and labor conditions, etc.; that unionism, on the other hand, has much to fear in fighting the system. The system will come to stay and will stay despite the opposition of the unions, so, in a contest against its introduction unionism is likely to be crippled. The wise unions, therefore, will work with and not against the system; the success of the system will increase production, lower costs, increase consumption, and thus increase employment. Now, if there are any fallacies in his statement, or if he is in error, I for one should be very glad to have it pointed out.

Mr. GOLDEN. Mr. Brandeis is speaking about a condition that does not exist corrected. There are some other representatives of other trades here, but to my knowledge, and so far as it has been introduced, or the attempt to introduce it is concerned in the textile industries, I do not know of any instance yet where organized labor was ever consulted, so that I have discussed this thing with Mr. Brandeis; his theory is right; I believe that if there is anything in this organized labor wants to do it, and organized labor is in a receptive mood to know it, but to my mind at the present time it has never even been consulted. I have debated this question with several of the exponents of the scientific management plan, but up to the present time, while nothing has been said in my presence in the open, I gather from what some of the members of the commissio stated this afternoon, and from a few words dropped this morning, that the belief is in the minds of at least some of the exponents of this new twentieth-century idea that there is not any need for organized labor any more, and that this is a plan to be worked out by John Jones, who is the employee, and by Prof. Smith, who is an expert, and the employer.

Commissioner WEINSTOCK. Well, doubtless there are some, and there may be some on the commission that have that point of view, but I have not met them.

Mr. GOLDEN. Just understand me, I do not say on this commission; I spoke of the exponents of scientific management.

Commissioner WEINSTOCK. Doubtless there are some that think this scientific system of management will achieve for labor all that unionism aims to achieve for labor. If there are any such, I for one do not agree with them. I am in accord with the point of view expressed by Mr. Brandeis, that there is and will

continue to be the widest possible field for usefulness on the part of organized labor in protecting organized labor against the unfair employer, who will always exist. From what you have said, then, are we to understand that if capital shall agree that labor shall be fully represented, that it shall have an equal voice with capital in all things that effect scientific management, then labor would not object to the introduction of scientific management?

Mr. GOLDEN. No. They would not object, but I would answer that further by saying that ever since my earliest recollection I have been adjusting these things along the best methods, etc. If some expert can come in and help out in that situation, yes; but I think we can continue without the theorist to map out the best method and the best plan of scientific management and run our different industries.

Commissioner WEINSTOCK. Well, to make this point perfectly clear, let us imagine that I am an employer, employing a great many men in a plant, and that you are representing the labor, and we come together, and I say to you, "Mr. Golden, I want to introduce this scientific system; I have been led to feel that it has merit and that I can profit by it, that my customers can profit by it, and that my workers can profit by it." And you say to me, "How are you going to do it?" I say, "I am going to secure the services of an expert to come in who will revise the whole system and pick out the weak spots, see where there is wastefulness, and utilize that wastefulness." You said, "I disagree with you, Mr. W. I do not think you need an expert for that; I think you and the rest of us ought to see all these things," and you fail to convince me and I am still determined to bring in this expert, believing that he has more knowledge along these lines that he has specialized on than you and I have together, and I say, "We differ on this point. I can not convince you and you can not convince me, and we are a hung jury; but I am perfectly willing, if you wish, that you shall have an equal voice with myself in any changes that may be brought about, and if we can not agree we will submit the matter to a third party and we will both abide by the decision." What would be your answer?

Mr. GOLDEN. That we would like the expert to come in and show us what he knew.

Commissioner WEINSTOCK. You would have no objection under those conditions?

Mr. GOLDEN. None whatever.

Commissioner WEINSTOCK. I have nothing further to say.

Mr. GOLDEN. We want him to come in there and show us what his knowledge is; we would welcome him.

The ACTING CHAIRMAN. Mr. Garretson?

Commissioner GARRETSON. No.

The ACTING CHAIRMAN. Mr. Lennon?

Commissioner LENNON. I want simply to bring out a little further one point that Mr. Weinstock raised. If you were assured, as president of your organization, and through that could assure the members that a proposition to put scientific management into one of the mills was to be done in entire cooperation with organized labor in the mills, would you give it the necessary investigation to determine as to whether it would be good or not, and fairly judge as to its merits?

Mr. GOLDEN. Oh, yes.

Commissioner LENNON. And if you found it good you would go ahead with the proposition?

Mr. GOLDEN. Yes.

Commissioner LENNON. I do not care to ask anything more.

The ACTING CHAIRMAN. Mrs. Harriman?

Commissioner HARRIMAN. No.

The ACTING CHAIRMAN. Mr. O'Connell?

Commissioner O'CONNELL. You say that the system has not been introduced in any of the mills as a whole, except possibly in some one mill, and that it is a sort of unknown commodity?

Mr. GOLDEN. Here and there in spots.

Commissioner O'CONNELL. Not enough to be made a criterion as to whether the product of the plant has been increased or decreased, or the wages increased or decreased, excepting some occasional case that has come to your attention?

Mr. GOLDEN. Why, yes; it has not been. Of course, you realize that the textile industry is a very large industry, and when you say the textile industry you take in everything that I mentioned this morning.

As we view it, and when I say we, I mean we labor men, it has not hit the textile industry yet very hard, but it is shaping toward that for the simple reason that the case I recited this morning occurred in one of our largest textile cities. Now, I have got some evidence here which I will leave with this commission. When we started this discussion in 1911 Mr. Brandeis was part of the discussion at the time; it was put into effect in a certain mill and was given a two years' trial; they had convinced a number of doubting Thomases that it was all right, and then they made the effort to convince me. I do not know whether my friend Duncan has been in Missouri any more than twice, but I have been there several times, and I said they had to show me; so I made arrangements and made the request that I be allowed to investigate it, and I want to say in justice to the employers who I believe were conscientious in the thing, I was given permission to go in there and make a personal investigation. After I had made an investigation of the system and had ascertained how it was working and so forth, I found that a large percentage of the employees were women and girls, and I felt there were some questions I would like to ask there, or at least there were some questions I would like to have answered, and I wanted to know what the effect on the human system was, so I made a request of the employer if I could bring a woman there and make inquiries, and so forth, and would he have any objections, and he said no. So I brought one of our experienced representatives, and she was allowed to go in the mill and she was allowed to interview the women and the girls, and she afterwards visited their homes, and she talked to them there, and that is all here in regard to the effect of this system, where it had been in effect for two years, on the workers.

I want to submit that evidence to the committee, and I only want to read one paragraph. Perhaps that will suffice to show that it is evidence.

This system was put into effect by representatives who are here.

The ACTING CHAIRMAN. You mean experts who are at the hearing?

Mr. GOLDEN. Yes.

Commissioner O'CONNELL. Does that show the earnings of the employees, both girls and women?

Mr. GOLDEN. It shows everything, Mr. O'Connell. Just while we have that question in mind, here was one of the systems; this was in the weaving department:

Every time the shuttle crosses the loom, that is what we call a "pick." In this particular mill they were paid by the number of picks per day, registered on a clock. If the weaver makes 251,400 picks per day, he receives \$2.41; but should he fall below this number of picks, he goes back to the flat rate of \$1.47 per day. In other words, should they make 250,000 picks or 250,400 picks per day, they lose their bonus and go back to the flat rate of \$1.47 per day. That means this—you will not understand the technical terms there, but it means this: The weaver works on these looms and is paid by the number of picks going, and his machine is calculated to go all day. Nobody has ever yet discovered how to stop a textile thread from breaking. It is going to break anyhow, more or less. If that weaver, working all day, got within one pick, going over that loom, of the necessary 251,400 picks, instead of getting \$2.41 for his day's work, he would get \$1.47. I asked the question: Who got paid for the difference between the amount of cloth woven for \$1.47, and one pick short of what they would get for \$2.41.

Commissioner O'CONNELL. The scientific-management man would tell you there that that was not scientific unless that had been taken care of. I am sure they would say that.

Mr. GOLDEN. All that surplus of cloth from every weaver that fell below the 251,400 picks, of course, went somewhere, but the employee did not get it. To me it seemed a very good proposition for the employer, because under the old system the weaver would have been paid for every yard of cloth he wove. Under the new system, if they should drive all day and make that necessary 251,400 picks, they would get \$2.41. If anything happened, sometimes something over which they had no control, they came back to the \$1.47, and somebody got the remainder. It was said—I am not in a position to prove it—that the expert got \$50 per week while he was putting this thing into operation, and perhaps that helped to pay his salary.

I just want to read one of these statements, of which there are a number:

"I interviewed another girl," said one of our women investigators, "also a spooler, whose statement was as follows"—a spooler is one that winds yarn on a bobbin:

"I can't make the bonus every day. When the work comes bad, and that is often, it is impossible to make the bonus. I have lost 19 pounds in three months and am fearfully nervous. I was fined 60 cents this week because the work came bad. I would much rather be paid under the old system, namely, for what I produced.' She was in bed when I interviewed her at 4 o'clock on Saturday afternoon."

There are a number of those cases, Mr. Chairman.

Commissioner O'CONNELL. Just file that document with the commission, will you?

Mr. GOLDEN. Yes; I will file it with you.

(The documents submitted by Mr. Golden were thereupon filed, and are as follows:)

SCIENTIFIC MANAGEMENT AS APPLIED TO THE TEXTILE INDUSTRY.

[By John Golden.]

Perhaps no subject has been more freely discussed during the current year than that of scientific management or what is sometimes termed "greater efficiency."

Louis D. Brandeis, of Boston, declared that by the introduction of greater efficiency the management of our railroad systems throughout the country \$1,000,000 per day could be saved.

I have no desire to discuss the subject of scientific management from the standpoint of the railroads, but when the ardent advocate of this most wonderful panacea—greater efficiency—heralded it as a cure-all for every industrial disease, real or imaginary, for which we suffered or were supposed to suffer, and included the textile industry as an example of what it had accomplished, I decided to make a thorough investigation.

The Brighton Mills, situated in Passaic, N. J., had been used on many occasions as a strong argument in favor of scientific management, this system having been in operation there for a period of about three years.

On March 23, 1911, accompanied by Sara A. Conboy, an organizer of our industrial union and a practical textile worker, I began the investigation.

We first interviewed the officials of the firm, including the owner, two superintendents, and the representative of the promoters of scientific management, who had been assigned to introduce and carry out this system in this mill. We were very courteously received by these officials, who placed not the slightest obstacle in our way toward securing all the evidence possible, and whatever be the evils of this system, I am satisfied that the owner of this concern is absolutely sincere in his belief in the system.

The Brighton Mills manufacture a peculiar grade of cloth which is used in the making of automobile tires.

They employ 635 operatives, 445 male and 190 female, of mixed nationalities, including 51 English-speaking male operatives, 41 English-speaking female operatives, 543 operatives of foreign descent, 394 of whom are male and 149 females. Of this number, 272 are Polish, 88 Italian, 84 Slavs, the remainder being divided between Hungarians, Lithuanians, Germans, Greek, French, and Dutch.

The mill runs 116 hours per week, with two sets of help. The day help works their schedule of 58 hours, beginning Monday morning at 12 minutes of 7, and stops at 6 p. m., with 42 minutes allowed for dinner, for five days in the week, and stops on Saturday at 18 minutes after 12, noon.

The night help perform their week's work in five nights, starting at 6 p. m., and stopping at 6 a. m., with thirty minutes allowed for lunch at midnight.

The sanitary arrangements in the mill are very good, separate clothes closets being provided for each operative, clean toilets and wash rooms for both males and females, and a very pleasant-appearing lunch room, where light lunches are served at cost price.

The whole system of scientific management is based upon securing the very largest amount of production in a given time, each machine being figured out as to what it should actually produce when speeded up to the limit. The price is then fixed on this amount of production.

Should the operator fall below the standard set a reduced price is then paid, which is commonly known as the flat rate. For instance, take the weaving department. The flat rate of wages is set at \$1.47 per day on four looms. If the weaver makes 251,400 picks per day they receive \$2.41, but should they fall below this number of picks, they go back to the flat rate of \$1.47, or, in

other words, should they make 250,400 picks per day they lose their bonus and go back to the flat rate of \$1.47 per day.

I instructed Mrs. Conboy to visit a number of these people at their homes, believing they would be inclined to give their opinions more freely there, while I got in touch with a number of the male operatives. We talked to about 50 people all told, representing the various departments in the mill. I withhold their names for obvious reasons, but have them recorded.

Without a single exception, we found the sentiment among the operatives interviewed to be very much against the bonus system. When asked the reason why, the replies would invariably be as follows: Yes, we get a little more money some days—not always—but we are pushed to the limit. The mental strain under which we work and our anxiety and fear that we will fall below the standard set makes the job scarcely worth while. We were far better off when we were paid for every yard of production we turned off; our overseers were more kindly disposed to us under the old system, as they are now working under the same nervous strain as we are, because they also are paid in accordance with the production of their help.

The following cases reported by Mrs. Conboy are a fair sample of the many investigated: In calling on two girls, who are sisters, I found one of them ill; the other was disposed to talk, and said, "I work as a spooler and have to get off 12 doffs a day to earn the bonus of \$1.47. The first attempt was to have us get off 13 doffs, but this was found to be a human impossibility. Should I get off only 11 doffs I receive \$1.05, the flat rate." On being asked if she liked the system now used in the mill she said "No, I would rather work by the piece or basket, as in former days. I come home from work every night exhausted and often wet through with perspiration. I never go to any place of amusement, being so tired that many nights I am in bed at 7.15. We are fined 15 cents for bad work when many times it is not our fault, but the fault of the spinner, and this fine is imposed whether we earn the bonus or \$1.47 or the flat rate of \$1.05 per day."

I interviewed another girl, also a spooler, whose statement was as follows: "I can't make the bonus every day. When the work comes bad (and that is often) it is impossible to make the bonus. I have lost 19 pounds in three months and am fearfully nervous. I was fined 60 cents this week because the work came bad. I would much rather be paid under the old system, namely, for what I produced."

She was in bed when I interviewed her at 4 o'clock on Saturday afternoon.

Another woman, who is a weaver on fine work, made the following statement: "I have worked there for a number of years, both under the old system and the new one, and find the work much harder under the bonus system. If a loom is stopped for any cause you lose the bonus. We have to wait many times for filling. We are fined for stained threads, ranging from 10 cents to 60 cents, according to the length of the stain. It is drive, drive, drive every minute of the day. I am ready to go to bed the moment I get home at night, often without supper. The flat rate of wages is \$1.47 a day. If we get off 272,600 picks registered by the clock on the loom, we get \$2.40 per day. If we fall below this number of picks, we go back to the \$1.47. I would a great deal rather work under the old system, for then I would be paid for all the work I do."

Loom fixers get 20 cents per hour. They get 5 cents bonus on every weaver that makes their bonus, and if all the weavers make it, he gets 10 cents for each one. Thus, if no one else is bound to drive the help working under him, he is, in order to secure as much bonus as possible for himself.

The men whom I personally interviewed were very emphatic in their dislike of the bonus system, and the substance of their reply to my questions was as follows:

"How do you like the present system?"

"It is no good."

"Why?"

"Because we are driven too much at our work, fined very heavily for imperfect cloth, some of which we are not entirely responsible for, and often fall down on getting our bonus through having to wait for filling. Our bosses do not treat us so well as formerly, and taken all in all, we would much prefer to be paid under the old system, namely, for every yard of cloth produced irrespective of bonus."

None of the help in this mill are organized. We did have a few members at one time, among them a vice president of our local union, but they were so openly jibed by some of the underofficials in the mill in regard to their mem-

bership in the union, that they finally stopped paying dues rather than be subjected to the sarcastic remarks of these same officials. The man who was vice president of our local union would be often asked: "Say, Mr. Vice President, when are you going to call a strike?" He stood for this until patience ceased to be a virtue, and then gave up his job rather than leave his union.

This is the story of scientific management in the Brighton mills as gleaned from operatives working under the system.

The story speaks for itself.

When greater efficiency and scientific management tends to *conserve* and not *destroy* human effort, when it makes for lightening the burden of the toiler, not to make it still heavier, then and not until then will it be successfully applied.

STATEMENTS OF EMPLOYEES.

(1) Spinner: "Work is very hard, and goes home from work badly tired out, and awful hot. I make \$1.05 a day, and if make bonus can get \$1.47. Work is very hard and we have to work, oh, so hard, to make the bonus. I have worked so hard I lost 19 pounds in three months, and am going to leave soon to do housework. I was fined 60 cents last week."

(2) Spinner: "We have to work like dogs, and you will not mind work if they give you what you earn. Last week I lose my bonus three days for only a little bit, and when I ask boss about it, if I get nothing for working so fearful, he say you get flat pay \$1.05. I hate my boss now, and he was one fine boss, but not no more. Would rather work old way, by the piece, for you work hard then, but get all you work for."

(3) Spinner (ring): "I don't like this way of working. I don't mind working hard, for we can make good pay if we make the bonus, but if I work hard all day till I am so tired then lose that bonus I get so mad I want to swear. Sometimes I cry, I am so mad, but it did not do me any good. Every girl so tired that we don't know what to do, only go to bed. Yesterday I had a fight with my boss, and told him I was so tired I must go home, and I did."

(6) Weaver: "I have worked in this mill for a number of years, both under the old system and the new, and I never worked so hard in my life as I have to work under this efficiency system. If a loom is stopped for any cause, you lose your bonus. Have to wait a long time for filling and the fines are fearful. We are fined for stained threads when many times it is not our fault, but we have to pay for it all the same. We get \$1.47 flat pay, and if we are lucky enough to make our bonus we get \$2.40. It is hard work in the winter when the weather is cool, but you ought to see us in the summer when the days are hot. But I don't intend to see another summer, and work like I did last year. It would kill a horse. I would a great deal rather work the old way, for there are periods when a women is not able to exert every bit of strength in her body."

(7) Weaver (man): "Like this system? I guess not. But what can we do about it? We are supposed to get 0.01 a thousand picks, but we don't get it. We get \$1.47 flat rate, no matter how many picks we make, if it is not up to the number. When we make 291,000 picks we get only \$2.29, and get \$2.13 for 272,000 picks on fine work. Weavers are worked so hard that many of them give out. The loom fixers are paid by the product that is taken off the looms, and he, if no one else, drives us as hard as he can. I belong to the union, and every day the boss asks me when I am going to call a strike, and so I will not stand it, and I am leaving this week to be a baker."

(8) Weaver: "I think that the system of doing work the way that we have to do it is cruel. They only think of how much work we can get off, and do not care how tired we are. We can work all day, and then if anything happens at the last hour that we break down or have a pick out, it means the loss of the bonus. The loom fixers get 20 cents an hour, and if our loom is stopped for one minute they are yelling at us, for they get 5 cents bonus when we make our bonus, and if all his weavers make their bonus he gets 10 cents for each loom, so you see he just pushes us for all he is worth. I would a great deal rather work on the old system than on this new one, for then we get paid for every yard we make, and now if we lose our bonus we lose a great many yards, and it is not fair."

(9) Ring spinner (night): "Work is very hard, especially on your feet. There is no time to rest at all. We work from 6 p. m. to 6 a. m. I get \$1.74 a day, and my feet ache so that when I go home in the morning the first thing I

do is bathe my feet and then go to bed, tired out. It is no work for a woman, to work all night, but I have to work, and you have to work pretty hard here. I do not like it, and I am going to do housework in the spring."

(10) Winder: "I do not like this way of doing work. If the thread comes good it is not quite so bad, but when the thread is poor, it is awful. If we want to keep up with the work, and make the bonus, you have to work like fury. We never walk up or down our alleys, but we run all the time, and our backs are ringing wet with sweat all the time. Of course, some girls can work faster than others, and then those that can not work so fast must work like sixty to keep up with the smarties."

(11) Man on roving frame said: "They got us down pretty fine, so fine that they have only one man doing the work that used to be done by two men and a helper. They can afford to pay us a bonus when one man does the work that was always done by three, so you can imagine how we must work, and if we do not like it, we can look for work elsewhere, or like going to school, go to the foot of the class, and every one who comes in will know that you are a slow worker. I wish the old way would come back again, but I guess it won't, for they make too much money working us this way."

Male and female help, by nationalities.

	Female.	Male.		Female.	Male.
English.....	9	6	Greek.....	5	1
American.....	32	24	Russian.....	28	10
Polish.....	223	49	Hungarian.....	4	0
German.....	15	11	Scotch.....	1	2
Italian.....	64	24	Lithuanian.....	2	0
Slavish.....	33	13	Bohemian.....	1	0
Irish.....	9	9			
French.....	9	6	Total.....	445	190
Holland.....	11	35			

Commissioner O'CONNELL. The females were largely in the majority, apparently, were they not?

Mr. GOLDEN. Just a moment. Perhaps I should answer that question, Brother O'Connell, in this way: This statement gives the nationalities. There were 445 females and 190 males. There were 223 Polish, 9 English, 32 Americans, 15 Germans, 64 Italians, 33 Slavish, and so on, down the line. The Polish were in the very large majority. There were only 9 English people—that is, people that had come from the other side—and 32 Americans, making 41 people who speak the English language, in this particular mill. Seventy-five per cent of the employees were foreigners.

Commissioner O'CONNELL. Would that run generally as the average of the industry?

Mr. GOLDEN. It would run generally in this way, that whilst you would get the Polish people in that ratio in one particular district or city or town, you would get the Portuguese in another, and the French-Canadians in another, and so on.

Commissioner O'CONNELL. I mean the proportion of male and female.

Mr. GOLDEN. We figure in our industry a little over 65 per cent or nearly 70 per cent are females and the remainder males.

Commissioner O'CONNELL. Have you figured out in your organization anything like approximately the average wage paid the girl or the woman in the industry?

Mr. GOLDEN. Yes; the average wage paid the women in the industry runs from about \$6 to \$6.50.

Commissioner O'CONNELL. How about the girl?

Mr. GOLDEN. The girl will run from \$3.50 to \$5.

Commissioner O'CONNELL. Have you figured the male earnings?

Mr. GOLDEN. To speak about the male average in the textile industry, you would have to take them by their particular work. You would have to take them in cotton, woolen, or silk. In the silk, they would be higher, and in the woolen and worsted, they would come next, as also the carpet. In the cotton, they would come lower still; would probably run between \$9.50 and \$10.50.

Commissioner O'CONNELL. That is all.

The ACTING CHAIRMAN. I think probably Mr. Brandeis would say, in answer to your last testimony, that those very points which you have raised would be cured if the system were protected on the part of the employees by collective bargaining. Would not that be so?

Mr. GOLDEN. Yes. I think one of the troubles undoubtedly is that the men who are expounding this scientific management idea simply go into the employer and say, "Here it is all ready; put it into effect." They forget the other fellow. They do not consider he has a voice in this thing.

It might be news to your commission to know that the great Fall River strike in 1904, which involved 26,000 people for six months, was brought about by the introduction of a system—not by the experts of scientific management, but by two new inventions, one a longer bobbin in the shuttle, which lasted a little longer; and the other, through the invention of what we call the warp electrical-stop machine, which stops the loom when the thread breaks. On account of that one thing it lessened the work of the weaver, and on account of the lessening of the work of the weaver—

The ACTING CHAIRMAN. Do you mean it threw the weavers out of employment?

Mr. GOLDEN. It did to this extent, that the weaver who could run 8 looms under the old system was told to run 10, and in many instances they were expected to run 10 looms for the same amount of money they got when they ran 8. Of course, the weaver, under that plan, was producing a little over one-fourth more as much cloth on the new system, and wanted some extra compensation, but was refused it, and then came a reduction of wages on top of that. While it is believed to this day by the outside community that it was resisting reduction in wages, it was really resisting an attempt to compel the weaver, on account of the new inventions, which entailed some more work on the weaver, to do it without receiving any extra compensation.

The ACTING CHAIRMAN. How was that strike settled?

Mr. GOLDEN. That strike was settled at the end of two conferences held in the statehouse in Boston. Gov. Douglas was governor at that time, and it was settled upon this basis: It took \$20 per loom to put on the invention. Our people were to run the extra looms, but we would divide the difference in the amount of production into three parts—one part of the profits accruing were to go to the employer, one part of the profits would go to the weaver, and the other part would go toward paying some little extra help that was put on there, which probably would amount to about one-fourth of the other part, and the remainder was to go to paying the expenses of putting in the invention. Of course, in the long run we easily realized the employer had the best of it, because one of the parts had been assigned to paying for the \$20 expense to put in the loom, and after that was paid he had the remainder, less the little extra for the help that was employed there.

The ACTING CHAIRMAN. Is there anything else, Mr. Golden?

Mr. GOLDEN. I just want to make this statement, Mr. Chairman, and then I think I am through, unless it brings out something else.

Mr. Brandeis and I agree to a great extent in regard to this thing having created a feeling, on the one hand, that the experts have gone ahead and said this will eliminate organized labor, etc., and that has created another impression that that is the reason why organized labor has shown some opposition to it.

That, in my opinion, is not so. On the other hand, speaking for the textile industry, I do not know of any single instance where the employees, let alone their representative, where they were organized—and, so far as I know, where they were unorganized—have been even consulted. But I am not so very pessimistic about this thing, because it is something like these revolutionary movements that come sometimes to oppose our American form of trade-unionism. I have a concrete case there in a neighboring State, where for 10 years—and I want to say this more particularly to the experts who believe that it is going to eliminate the organized labor movement, and I want to say that in my judgment whoever brings this scientific management out in its true value will find that to be the result—in this particular locality, within the last six months, where we have failed for 10 years to organize the women workers, a man went in there and sat over the girls with a stop watch, to introduce some new fads. There are about 640 girls employed in there, and as a result of that they are all members of our union to-day. I think he was the best unpaid organizer we ever had.

Commissioner WEINSTOCK. You agree with Mr. Brandeis, then, that the introduction of scientific management, as a rule, will not destroy the usefulness of the unions?

Mr. GOLDEN. It will if it is followed out along the lines they suggest. That might maintain there. The only reason that came out—if I may finish the story—was that the union men all around there were well organized. The women and girls had never seen the necessity of organizing, because they got everything that came along in the shape of shorter hours. They just had their hours reduced from 60 to 54 as the result of organized effort; but the minute the man came in with the stop watch and began to tell a woman who had worked in that particular job for 15 years, and who was old enough to be his mother undoubtedly in many instances, how she would have to do the job, and she would have to do it in that way or get out—so the bosses said later—they immediately began to organize. But the injustice of the thing is shown in the other particular instances, where the foreign element are being dealt with, where the unorganized element are being dealt with. I do not know just what conditions exist there now. If this commission has the time, either now or some time later, to make an investigation of that condition, I would like them to do it, because I can not get within a quarter of a mile of the mill now. I was received with open arms in 1911; but because we told the truth of what the conditions were there, it is not possible to get in their mill any more. But where they are organized, our people—and that will bring about intelligent organization, and all that has been eliminated in this particular instance where they organized—if it is allowed to go ahead in places like the one I have cited previous to the last one, hundreds of thousands of people in our industry are liable to be exploited for years without anybody knowing anything about it.

The ACTING CHAIRMAN. Have you anything else to say Mr. Golden?

Mr. GOLDEN. No.

The ACTING CHAIRMAN. We are very much obliged to you for coming here.

TESTIMONY OF MR. HARRINGTON EMERSON—Recalled.

The ACTING CHAIRMAN. Mr. Emerson, we understood that you wanted to make a brief statement, or some supplementary suggestions?

Mr. EMERSON. If the commission permits, I would like to make a few more remarks.

In my first testimony I spoke very strongly against piece rates. I would like to say that there was one thing which we learned from piece rates. It was brought out in Mr. Tobin's testimony that the men very often work only seven hours under piece rates. We did learn it was of very great advantage to give the men jurisdiction as to how long they should work. Usually when a man is working under piece rates there is no objection in his working for seven or eight hours, or any number of hours he might see fit, as long as he usually accomplishes a certain minimum. So that feature of allowing the man to determine what he shall do with the time that he gains, I consider a very desirable feature. It is one that I might embody in a particular method that I use, that was based upon the contracts made by the Brotherhood of Locomotive Engineers and the other trainmen.

I would like to call to the attention of the commission the natural law of work, because that is a very important matter that underlies a great deal of this modern movement. If a man is going at top speed, namely, 20 miles an hour, he can only accomplish 300 yards in a day, and he can only do that by taking baths and massage, and being treated medically in order to keep him in condition. Three hundred yards is the total output of a man at a speed of 20 miles an hour. If, on the other hand, he goes 3 miles an hour, he can do 172 times as much as when he goes at top speed. So it is perfectly evident that there is a very much lower speed at which a greater amount of work will be accomplished.

Long hours are always more economical. If we disregard entirely the human side of it, you can get more out of a man working 16 hours a day than you can working 12 or 10.

For many years I did not believe that, but I have finally found it was so. Therefore, we must deliberately curtail a man's output for social and for ethical reasons, and not for economic reasons. If it is considered advantageous to cut the time down to seven or eight hours, that is a benefit which the com-

munity or the fabric of society reaps from some of the gains made. It is not cheaper for the employer to do it. It is more human to do it. But this is not true of machines, railroads, steamers, glass, steel, and paper works. There you really want to get just as much out of your plant as you possibly can. Whether you shall work with two, three, or four shifts is a question, of course, for discussion and deliberation. It takes less men, and they individually earn more on two shifts of twelve hours. The plant undoubtedly does better on three or four shifts. It is because of improvement in the plant that we have been able to progress from 16 and 14 hours down to 12, 10, 8, and even less.

Mr. O'Connell asked me whether I knew of any cases under my experience of reduction of work. At Albuquerque we advocated putting through a reduction of hours from 10 to 9, when I was connected with the Santa Fe Railroad. I recommended for the whole road a standard of 9 hours a day instead of 10, but I was not able to put that through. On the 9-hour basis, at Albuquerque, a man earned 20 per cent more per hour, and a total of 10 per cent more in the day, and gained 10 per cent of their time. We always left it up to the men to choose whether they would work 80 per cent for 10 hours or 100 per cent for 8 hours.

This is a personal matter now: One of the witnesses spoke of the Emerson system having cost the American Locomotive Co. \$800,000.

I think it is a matter of record that the giving up of the system caused an increase of expense of \$800,000 to the American Locomotive Co., which is perhaps what he was referring to.

In listening to the scientific managers and to the representatives of organized labor, and to the members of the commission, I have been reminded of the babes in the woods who were buried under a shower of falling leaves. I have heard details, endless details, and very few principles. This was written, however, before Mr. Brandeis spoke.

By scientific skill we can regulate the channel of the Mississippi, but we can not hold the water back by dams, nor can we turn it back.

It seems to me that the efficiency movement is a movement which began centuries ago, which is now world-wide and is growing irresistibly. You can check the movement; you can not stop it. The first thing to be realized by the people of the world, by the United States, by this commission, by employers, by employees, by organized labor, and by efficiency engineers, is that the movement is above us, superior to us, and that our separate and collective duty is to play the game, and that if we do not play the game we shall be hurt.

Several minor aspects of this question have in my opinion been emphasized out of all proportion. These minor matters are devices of methods of pay, of collective bargaining, of overwork, and of reduction of pay. Devices like slide rules, stop watches, etc., are interesting, ingenious, and valuable, but not of vital importance, and only important when of use. Any method of pay or bonus used as a stimulus is a wholly minor matter. Do not let us mistake the flavor of salt on the beefsteak for the beefsteak itself. Cooperation is the essential. Equitable division comes next.

I would through cooperation rather receive one-third of \$1,000, even though I was entitled to two-thirds, than to secure the whole of \$100. There are more powerful incentives than bonus. We have never forced any man to take bonus.

Collective bargaining about the laws of the universe is an absurdity. We can either play the game or not play it. We can not bargain collectively about infant mortality. If we observe certain laws infant mortality sinks as low as eight per hundred in the first five years, or we can have it as high as 80 per cent. It is simply a question of observance of the laws. Now, of course, as to infant mortality, you can decide whether you are willing to have 80 per cent of mortality, or you will have eight, but you can not get away from the fact that 60,000 bacteria in a cubic centimeter of water means a very high mortality.

To overwork is a violation of a law of physiology. For one person who overworks scientifically there are 2,000 who overwork unscientifically and 10,000 who underwork unscientifically. Personally I have no ideal of little work and short hours. I like to work 12 hours a day, and to work faster is my greatest pleasure, because I like my work, and two-thirds of it is without pay, but I am perfectly willing to accept the idea of underworking scientifically versus underworking or overworking unscientifically.

Reduction in pay: It is a law of the universe that value increases faster than cost of effort. Any proposition to degrade value is on the face of it an idioy. Rather than try to legislate against several million examples of idioy

I would like to see idiocy itself suppressed, and suppressed by the encouragement of common sense.

I am perfectly willing to pay men \$12 a day for eight hours a day, but if in accordance with the rules of the game I am also willing to work 16 hours a day on bread and water, and thank God for the privilege of both the 16 hours and the bread and water, and a good deal more grateful for both than for the dollar and a half. If anybody has ever been wrecked at sea and has rowed 16 hours in a boat to get anywhere, he will understand what I mean.

Commissioner O'CONNELL. I have been out in one, but not that long.

Mr. EMERSON. It is the game we must play, not bumblepuppy, whether we are playing baseball, football, chess, golf, or the game of life.

I would like to bring up some of the questions of disagreement, apparently, between the scientific managers. There are certain systems that have been mentioned; for instance, those of Halsey, Taylor, and others. The fundamental common ground is the establishment of standards and their attainment, and that is the only common ground that can be, namely, the setting up of an ideal and a desire to attain it. What the ideal shall be and how strenuously it shall be sought for, and what the methods are for attainment, are subsidiary questions. One may use a notched stick for a method, or a Hollerith machine. I have seen the Igorotes shoot dimes out of notched sticks, and they preferred the dimes to the nickels, and I have also seen the United States Navy hit a target at 8 miles at the first shot.

Forty-five years ago my brother and I were trying to find standards. We were suddenly thrown into new conditions in frontier life. We were attaining standards as a regular habit when Mr. Taylor was, according to his own report, still soldiering. In my own experience as a general manager I was asked to take care of a plant that had been trying to manufacture a product that had never before been produced in this country, or anywhere else in the world, for that matter, successfully. We had to mix our materials chemically; they had to be weighed out on standard scales with the greatest exactness; the time of the melt was an exceedingly important element. I went to Mr. Bristol, and we timed the cooling of the material, which was glass, and we found that it dropped a dozen degrees in temperature in one-fifth of a second, and that the whole subject of the operation of those machines depended on how fast we could operate them in that slight period that we had before it cooled off.

Of course the whole glass did not cool in a fifth of a second; it took a little longer time, but it came within fractions of a second that you had to operate. Now, it was not possible to have any collective bargaining as to those points. Later, when the glass passed into the lehr, we had pyrometers that recorded its exact temperature; they were not allowed to vary more than 5°. We had clocks, and every time a clock rang a man had to pull a handle and move the lehr and move the glass along, and the whole thing was absolutely a matter of necessity, not as collective bargaining, which would not have been possible in any way whatever. It was run on a stop-watch proposition and a clock proposition; it was simply a question for the men and the management and everybody else as to whether we could make glass or whether we could not.

We had no bonus, no piece rates, nothing but straight day pay. We had to keep a watch on the men, or rather observe the men, to keep them from overworking the schedules, just as people speed automobiles; we had to slow them down. In the cutting room it was different; there was great waste from the broken glass, and by doubling the wages we were enabled to increase the wages 50 per cent by simply lessening the amount of broken glass. It was after this experience that I met Mr. Taylor. I think Mr. Taylor was entirely too modest in pointing out the tremendous and wonderful work that he has done in the history of machine-shop practice, which he has revolutionized all over the world by the invention of high-speed machines.

Mr. Barth, with his slide rules; Mr. Galbraith, with his motion pictures; they have also done wonderful work; but I am acquainted with work equally wonderful among men who have been associated with me. Mr. Power, for instance, is a man that on one occasion when the men had gone out on strike went out from a conference with the president and was immediately surrounded when he came out by the pickets, and both the president and the pickets wanted him to advise them as to how to settle the strike. His great ability as an efficiency manager lies in the fact that he can gain the confidence both of the men and the employer.

One of the other men associated with me, my brother, made this statement. He says, "You can not get a man to work faster by offering him any bonus;

you can not get him to work faster by telling him that it is to his advantage, or that the work is more economical, or for any other reason of that kind. A man will cooperate with you if he likes you, and he will not like you unless you first like him."

Now, there are principles that I think are fully as important in installing scientific management as the slide rule or the motion picture or the stop watch.

One of my other assistants rose in three years time from being a machinist to being superintendent of motive power, owing to certain qualities that he had, of great energy and initiative. The problems of organization, I think, are more important than those of the stop watch and of the slide rule. I think vocational selection is more important than the question of the stop watch and the slide rule. I have known Mr. Taylor's work; I have gone into shops where Mr. Taylor's work has been installed, and I have checked it up and have found it exceedingly good; sometimes he would have made it a little less hard, at other times a little harder. We take Mr. Taylor's standards on belts; on pig iron we were able to surpass him. I say no actual results that have been attained that were superior to these have been attained by other methods that were fully as important.

I have noticed 100 per cent improvement in 12,000 men in two years' time. That seems very much more practical than 300 per cent improvement of 100 men in five years.

One of the managers at one time told me quite recently, "We are only doing 50 per cent at the present time of what we ought to do." He says, "It is 100 per cent better than it was before we started on this scientific management."

System is not efficiency. The accountant is not an efficiency engineer. Strenuousness is not efficiency. I regard the eagle as far more efficient than the rooster, and yet the rooster works a great deal harder when he tries to fly than the eagle.

In establishing standards I think Mr. Taylor and his skill are preeminent. They have made wonderful studies of methods of establishing standards, and methods that can very often be immediately accepted and built on.

The question of wages: As I said before, one of the employers came to me one time and said, "You come, Mr. Emerson, and induce my men to increase their wages from \$8 a day to \$12 a day?" I said, "That is exactly the kind of thing I would like to undertake. The fact is that the higher the wage is, generally the more economical the wage. I can see no incentive for an employee to lessen his wages, and to destroy anything that he has carefully built up. On the other hand, I would prefer always to secure the kind of man that required higher and progressively higher wages all the time.

The ACTING CHAIRMAN. We are very much obliged, Mr. Emerson.

The hearing is now adjourned.

(Whereupon, at 5.45 o'clock p. m., the commission adjourned.)
